440 Square Miles Timber Limits

on Georgian Bay

to be Sold by Private Sale in Large or Small Blocks.

On account of their President and Principal shareholders being engaged in other large enterprises, and not having the time to give to them all, THE PARRY SOUND LUMBER COMPANY, Limited, offer for Sale all of the timber lands, mills and town property situated in the Town of Parry Sound; also Tug Scow and full Camp Equipment for five camps, including boom chains, snow plows, sleighs, etc.

THE LIMITS TO BE SOLD

comprise some 440 square miles of licensed and deeded Pine, Hemlock, Spruce, Birch and other timber. The licenses from the Ontario Government include all timbers and are not restricted for time. Government dues are as follows: Saw Logs, White Pine, $1.50 per M. ft., B.M. Saw Logs, Hemlock, Tamarac and other woods 75c. per M. ft. The timber is situated in the Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street. The Canadian Pacific, Canadian Northern aud Grand Trunk Railways run through the limits, which makes some of the parcels offered for sale particularly desirable for small mill owners.

A circular giving full information, maps, terms and conditions of sale will be furnished upon application to

HANCHETT
U.S.REG.59,352. JAN 8,1907

The Filing Room

In the best equipped most efficient mills all over the country, where the value of standard equipment is appreciated—there you will find Hanchett Filing Room Equipment installed. Please note the advantages these mills have secured.

The Hanchett Filing Room Machinery are modern machines, are practical, simple, efficient, easy to adjust, easy to operate, and do first-class work. They are solid, rigid, heavy machines. Made upon honor, and they have genuine merit. The adaption of Hanchett Tools and Machinery for the care of saws and knives means quick installation, low cost of maintenance and renewals, and economy of operation.

THERE WAS A REASON WHY:

Schwager & Nettleton, Seattle, Washington, demanded Hanchett Filing Room Machinery.

Let us ship you this HOLLOW BLAST GRATE on APPROVAL. You need not keep it if it is unsatisfactory. WE pay the freight.

On the market twenty years, first in its original and then in its improved forms. Over 6,000 sets in daily use.

The following is a sample of our correspondence :

Before Using

Cleveland, O., Dec. 10th, 1907.

The Gordon Hollow Blast Grate Co.
Greenville, Mich.

Gentlemen:

I have three 300 h.p. Wickes Vertical Boilers with Dutch ovens attached to a 4-ft. chimney in use at my saw mill, burning all wet fuel, but I am not able to raise enough steam. Each grate surface is 7 ft. wide by 6 ft. long.

Will your hollow blast grate improve my condition and raise my steam?

If so, I would kindly ask that you give me your price on same.

Awaiting your reply, I remain
Very truly yours,
THEODORE KUNDTZ.

After Using

Cleveland, O., July 24th, 1909.

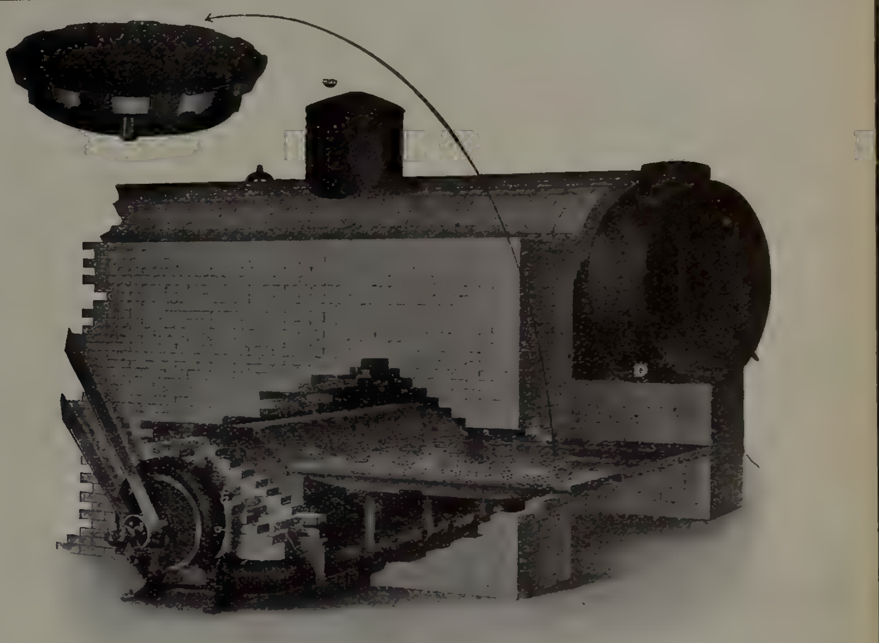
The Gordon Hollow Blast Grate Co.,
Greenville, Mich.

Gentlemen:

I had three 300 h.p. boilers in use at my saw mill, burning mostly wet fuel, and WAS NOT ABLE TO RAISE STEAM ENOUGH TO KEEP RUNNING.

Since installing your hollow blast grate I have been using only TWO of the boilers and have STEAM TO SPARE and I would recommend your grate to anyone using WET FUEL or NOT HAVING CHIMNEY DRAFT.

Very truly yours,
THEODORE KUNDTZ.



The Gordon Hollow Blast Grate can be used in plain furnaces or Dutch ovens, and with any number of boilers, from one up. Calls for no change in construction. Easy to install and operate. Saves labor in firing. Is kept comparatively cold by the current of air within, which makes it practically indestructible. Does not throw sparks. Can be fired on without running the blower, if desired. This is often necessary at night.

In writing for prices state how many boilers you have and whether you have ordinary furnaces or Dutch ovens, and give width and length of grate surface or surfaces

Gordon Hollow Blast Grate Co., - Greenville, Michigan

Also manufacturers of the celebrated "TOWER" line of Edgers and Trimmers

LOGGING LOCOMOTIVES

Six Coupled, Double End, Tank Locomotive for use in logging districts where construction of permanent roadbed is uneconomical.

This type of locomotive is suitable for roads with

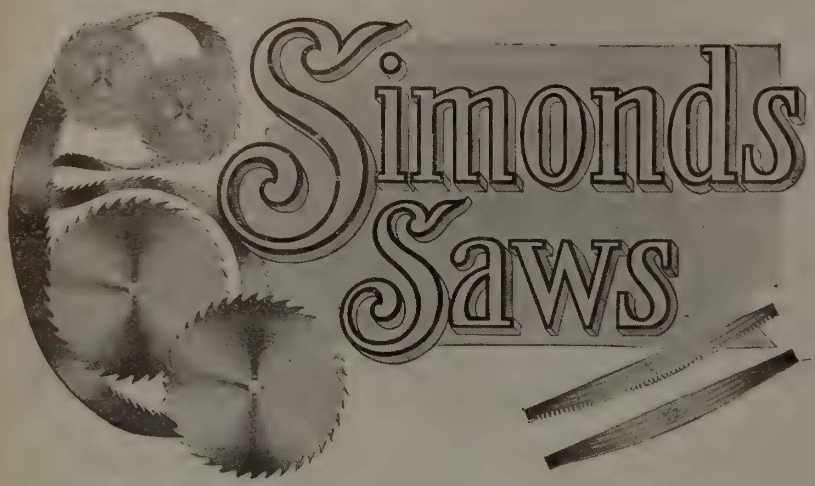
Steep Grades
Sharp Curves
Light Rails

It has a large hauling capacity, combined with light weight per wheel on the rail.

The wheel arrangement, with radial trucks at front and rear, gives good guiding qualities for running in either direction.

MONTREAL LOCOMOTIVE WORKS, LIMITED

BANK OF OTTAWA BUILDING, MONTREAL, CANADA



This saw that represents the big economy whether Band or Circular, is not the one you pay the least for delivered down at your mill.

The frequency or infrequency with which they must be changed, and filed and tinkered with counts some, for this takes time, you know, the time that runs into money, and it is only the saws that are able to hold an edge and that won't crack, that make for economy.

Simonds Band Saws, because of the selected material used, their uniformity of temper, their hardness without brittleness, their eveness in grinding and strength of the brazing, are used in the biggest, busiest mills in the world for the sole reason that being so made they cut more lumber, stand more wear, tear, and hard driving, than saws of other make.

Your first order for a Simonds Saw, let it be Band, Gang, Cross-cut, or Solid or Inserted Tooth Circular, will make this so evident that it will never be your last.

Canada, United States and Great Britain, $2.00 per year in advance; other foreign countries embraced in the General Postal Union, $3.00.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Vol. 31 Toronto, April 1, 1911 No. 7

Quebec's Excellent Annual Report

The annual reports published by the Department of Lands and Forests of the Province of Quebec are always of much interest to lumbermen. The report for the year 1910, which has recently been published and which was partly reproduced in the previous issue of the "Canada Lumberman," is no exception. It contained not only an interesting outline of the work which was done by the Department during the year, but a great amount of practical information of value to the lumbermen of that province. The most interesting statistical fact in the report was the increase in the amount collected in timber dues, rents, etc. The total, $1,033,895, was greater than that of any year since 1905. The natural inference is that the lumber industry in the Province of Quebec has at last returned to something like the prosperity which it enjoyed previous to the recent depression. Unless some serious setback is suffered, it is reasonable to look forward to a statement in the next annual report to the effect that the receipts from these sources exceeded those of any previous year. Irrespective of the increased receipts which are to be expected from the prosperity of the industry, the Department expects to reap an increase of $350,000 from the increase in the tariff and ground rents which recently went into force.

This increase in the charges upon the industry, placed upon the Government an increased responsibility in the direction of more energetic supervision of operations. When the Department recently inaugurated its policy of careful supervision of lumbering operations and placed the matter in the hands of trained foresters, many of the lumbermen of the province were inclined at first to object to what seemed to them like too much government interference. The neglected state of the forest resources of the province, however, amply warranted such a step, and it is encouraging to note in the report this year a statement that the lumber operators are taking kindly to this supervision and that little trouble is expected in the future. Although this involves some extra work on the part of camp foremen and others, it means, in the long run, a more business-like method of operating, and the many ways in which the Department, with the assistance of the lumbermen, can work for the improvement of the whole industry, gives good reason for believing that Quebec has actually entered upon a new era, in which lumbering will be conducted more economically than in the past, and in which careful attention will be given to the preservation of the forests so as to make them a source of perpetual wealth.

Speaking of the preservation of the forests, one is reminded of the good fortune which the Province of Quebec experienced last year in regard to its immunity from fire losses. The Department of Lands and Forests is giving special attention to this matter and is creating an efficient and practical forest fire fighting force. Last year they were assisted greatly by favorable weather. Frequent rains, coming just at the periods when there was greatest danger on account of the drying up of the country, reduced the possibility of fire to a minimum. The practical result was a negligible loss by fire and a reduction of the expense of the fire fighting service from $20,500 in 1909 to $13,500 in 1910.

One of the most practical methods in which the Department of Lands and Forests assists the lumbermen in their operations, is by the advice which it gives in connection with woods operations. License owners have ben requested to be more methodical and more economical in the operations, and it is satisfactory to learn that this advice is being taken in the spirit in which it is given. The report states that several of the largest and most successful operators in the province have adopted the methods recommended by the Department and now conduct their operations in a manner which is regarded as almost ideal. Economical cutting is one of the things which the Department is doing its best to inculcate. The regulations require that stumps be cut not more than two feet above the ground. This, although it is considered troublesome by some old operators, is still said to be too high, and some of the operators to-day are even cutting lower than two feet. By saving all that is possible at the stump of a tree and by going as far as possible up into the top, operators can save a great deal of valuable timber which in former years has been permitted to go to waste. In the choice of trees and also in the cutting up of trees which have been burned or overthrown there is room for great advance over the methods which for a long time have been in pretty general use.

In the directions outlined above and in many more the Department of Lands and Forests of Quebec, presided over and manned by trained foresters, has been doing a splendid work for the lumbering industry of the province and has been setting an example in the management of its forest resources which it would be well for all the other provinces of Canada to study carefully.

Good Prospects in New Brunswick

According to the report of the Surveyor-General, Hon. W. C. H. Grimmer, which has just been presented to the Government of New Brunswick, and which is published in part elsewhere in this issue, the lumber industry in that province, although it has many srious troubles to face, is entering upon the season of 1911 with a fair prospect of enjoying a successful year's business. Depending for its markets as it does, so much upon other countries, principally Great Britain and the United States, the Province of New Brunswick suffers more than any other part of Canada when political or economic conditions in those countries exert a depressing influence upon trade. This has been the case of late years, more noticeably than ever before, and at present the political situation in the United States is retarding trade in New Brunswick lumber considerably. The situation in Great Britain, however, offsets in a large measure that in the United States, and it is felt that during the coming year an advance can be expected in the price of spruce, in that country.

Not only are politics keeping the lumber markets of the United States in a condition of uncertainty, but other factors are combining to induce producers in New Brunswick to consider the advisability of reducing their cut. The cedar situation is a case in point. It is believed that the cut of this wood in New Brunswick during 1911 will be about 20,000,000 feet less than usual. The cedar of the Pacific coast comes into direct competition with that of New Brunswick in the markets of the Eastern States. What with the preference which consumers give to western cedar, and the increasing use of patent roofing materials, the time has come when, according to the report of the Surveyor-General, it will be necessary for New Brunswick manufacturers to put their cedar into some other form than shingles.

Like the Province of Quebec, New Brunswick is taking careful steps to ensure the accuracy of its scaling returns. Monthly statements are now required, signed by the foreman of each camp. The Surveyor General reports that he has every confidence that this step will be carried out successfully and that it will result in preventing, in a large measure, the disputes and necessary investigations which arise under other conditions when stumpage bills are represented. It is a source of satisfaction to learn that, as in the case of Quebec, lumbermen are meeting the Government more than half-way in this matter.

As was to be expected, the inauguration of a policy last year, of permitting the cutting of under-sized lumber in certain sections of the province, where the growth was known as thicket or stunted growth, as well as heath growth, and lumber growing on barren lands, has not been an unqualified success. If the regulation could be carried out precisely as was intended, it would not be a source of trouble and the use of such timber would be an important economy. But the Surveyor-General reports that the results have been anything but satisfactory, and licensees have not confined their cutting to the lands described in their application, but have extended their operations indiscriminately to good growing lands, thus depleting the forests, which, in time, would produce good saw logs. The experience of the department has been so disappointing in this respect that in the interest of the province, the Surveyor-General believes that the only true policy of lumbering is to confine operations to the cutting of merchantable logs, removing as much as possible of the tops of trees from the forest to conserve the young growth. It is a misfortune that the lumbermen have been unable to take advantage of this regulation without abusing it. The best thing that can be said of the situation is that those who have exceeded their rights in this connection are not representative lumbermen, but merely small operators or others who have not the welfare of the industry at heart.

Another point of similarity between the New Brunswick report and that of the Province of Quebec, is the fact that both provinces were, during the year 1910, singularly exempt from forest fires. During the danger times in May and June, there was a plentiful rainfall in New Brunswick, all over the province, and the same was the case in October. In spite of this immunity from fire, however, the report urges that more stringent laws for the prevention of forest fires must soon be put into execution. This is a fact which no one will contradict. There is always hanging over our heads the possibility that a dry season will occur and a great conflagration similar to that on the Miramichi in the year 1825 will bring ruin and death to large sections of the country. No steps should be omitted which will prepare the country to prevent such catastrophes and to fight all fires in their early stages, so as to prevent their becoming of serious proportions. The three eastern provinces of Canada escaped with scarcely a scorching last year, but the Province of Ontario provided an example of terrible loss and suffering from forest fires which will, it is hoped, go a long way towards inducing all those who are responsible for the protection from fires to do everything possible to prevent their spread.

Reciprocity Situation as seen by an English Lumberman

An interesting article upon the reciprocity situation as seen by an English timber merchant is published in a recent issue of the Timber Trades Journal of London, England. The author is Mr. I. Hamilton Benn, M.P., director of the firm of Price & Pierce, Limited, London, Eng., and of Price Brothers & Company, Limited, Quebec. The article is as follows:

The effect upon Canadian timber properties and upon the Canadian lumber trade with this country of the measure of reciprocity now proposed between Canada and the United States cannot fail to be considerable. The striking fact is that according to the statements of many authoritative persons, the available supplies of timber in the United States do not exceed 20 years' life at the present rate of consumption, but this is no doubt an extreme view. Still, it would seem to be explanation enough for the lumber items in the new agreement. At present there is a United States duty of $1.25 per 1,000 feet on Canadian lumber, and this duty is now to be removed. Only those who realize to what an enormous extent lumber enters into the daily requirements of industrial and agricultural peoples such as those of Canada and the United States can appreciate the place which lumber holds in the national economy. Obviously it must be to the immediate advantage of the lumber interests of Canada to secure this free entry to a gigantic market such as that of the United States, with all the advantages of better prices and keen demand, but there has arisen in recent years in Canada a strong national movement for the conservation of Canadian resources. This has found expression in the formation of the Conservation Commission, of which the ex-Minister of the Interior, the Hon. Clifford Sifton, is the chairman, and the whole energies of this body of influential and representative men are being directed to measures which will save Canada from a repetition of the depletion of forest wealth which has brought the United States to her present critical position. This is, of course, a question of large national policy. For the moment it is certain that, on the whole, the opening up of the American market will mean a considerable appreciation of all the standing timber properties throughout the Dominion.

I am asked what effect this greatly increased lumber trade with the United States is likely to have upon the British market. Fifteen or twenty years ago 33 to 35 per cent. of the total British imports of timber came from Canada. At the present time this proportion has fallen to about 22 per cent., partly owing to a smaller importation of Canadian timber, but mainly to the increased supplies obtained from Russia and the Baltic. I anticipate that, with the agreement in force, the decline in the proportionate British use of Canadian timber will be greatly accelerated, and it seems inevitable that British prices must go up.

It may, perhaps, be worth noting that in the opinion of many Canadian authorities, with which I certainly agree, the timber properties in eastern Canada are not likely to derive quite as much benefit from the agreement as those in some other parts of the Dominion, for the reason that so large a part of the sale value of timber is due to the cost of getting out the lumber, and this is determined mainly by the prices of food and other supplies for forest operations and the cost of labor. It is anticipated that a large increase in the exports of food products and hay to the United States in consequence of the removal of the duty will restrict the supplies of these articles for local consumption, and therefore raise the price. In that event the cost of getting out the lumber will be increased, and may to some extent counteract the advantage of increased prices obtainable for the timber itself.

Another aspect of the subject is the development in Canada of paper making and other industries allied to the lumber trade. A very considerable amount of capital is being sunk at the present time in the construction of pulp and paper mills of the largest and most modern type. Paper is one of the items of the new reciprocity proposal, that is to say, it is to be admitted free into the United States from Canada when there is no export duty or export charge of any kind on the wood or wood pulp exported from Canada to the States. As is well known, there are provinces of Canada which, by means of their provincial regulations, practically prohibit the exportation of the raw material from Crown lands, their object being to retain the manufacture of the finished article within their own domain. There is little expectation in Canada of a modification of these provincial regulations, but it will not be very long before the Canadian paper does enter the United States free of duty, for the supply of pulpwood is already running short on the southern side of the border. The mills in Wisconsin and many other places are ceasing to make "news," and must either go out of business or turn their attention to "book" or other higher grades of papers, in the manufacture of which ground wood does not play so large a part. There is already an importation of paper into the United Kingdom from Canada, and there is certainly a widespread expectation in Canada that as the Canadian paper industry extends an important market should be found in the United Kingdom. Of printing paper, for instance, the total Canadian exports were $2,500,000 in 1909-10, of which 20 per cent. went to the United Kingdom, 50 per cent. to the United States, and 25 per cent. to Australia and New Zealand. Therefore, there is a substantial British interest in this development of United States and Canadian policy, and not for Great Britain alone, but also for the Empire."

United States Lumber Dumped in Canadian Markets

An interesting report of the imports and exports of the United States, with reference to wood goods for the year 1910 is published elsewhere in this issue. An analysis of the statement shows clearly that the lumbermen of Canada, in asking for a duty on lumber coming into Canada as a compensation for the duty which has been levied on lumber entering the United States, have been amply justified by the conditions of trade. Take, for instance, the matter of boards, deals, planks, joists and scantling, under which heading are included an important percentage of the exports of wood goods to Canada. Last year the exports of these to Canada were valued at $7,670,201, and in 1909 the value was $3,770,066. The increase for the year 1910 was, therefore, very nearly $4,000,000. Lest it should be thought that this increase was the result simply of energetic salesmanship of the representatives of United States firms, irrespective of any other factors, it is well to consider the prices which were obtained for these goods. In 1910 the average price per thousand feet of the exports of wood goods to Canada under this head was $25.54. In 1909 the corresponding price was $27.84. There was, therefore, a decrease in the price during 1910 of $2.30. Taking this fact in conjunction with the doubling of the total quantity of the exports of this class to Canada there is only one natural conclusion to reach. United States exporters of these goods to Canada during 1910 were freely practising their national habit of "dumping." There can be no other explanation of

There is an even more significant proof of this fact in the prices and totals of the exports of the same class of goods to all countries, Canada included. During 1910 the exports to all countries of boards, deals, planks, joists and scantlings amounted in value to $41,675,785, and the average price was $21.93 per thousand feet. During 1909 the total value was $32,856,078, and the average price was $21.40 per thousand feet. There was, therefore, an increase in the average price during 1910 of 53 cents and the total exports increased only about 25 per cent., as compared with an increase of over 100 per cent. in the exports to Canada in the face of a drop of $2.30 per thousand feet in the price. The natural conclusion is that the manufacturers of the United States had a good enough trade with other countries to secure their regular prices, but that they used the convenient Canadian market as a dumping ground to dispose of their surplus stocks, even at a considerable sacrifice.

Other interesting facts are shown by the figures in these tables. In the first place, the figures of imports of logs and round timber show during the last three years that there has been a constant increase of imports on this item, the imports for 1910 being almost double those of 1908. The exports of logs, round timber and timber hewn and sawed show an increase of over 9 per cent., as compared with 1909. The imports of boards, planks, deals and other sawed lumber showed a small decrease and a slight increase in the average price. Imports of laths into the United States increased nearly 50 per cent., with a fractional increase in the average price. The imports of shingles on the other hand decreased, as a result, no doubt, of the increase in the duty. The decrease was about 30 per cent. as compared with the imports of shingles in 1909. The average price also fell off, though only to a small extent.

The imports of pulpwood showed an increased of nearly 8 per cent. and the imports of wood pulp showed an increase of nearly 29 per cent. The imports of wood pulp from Canada increased nearly 28 per cent. In the face of the import duty of one-twelfth of a cent per pound on mechanical wood pulp entering the United States this is a rather surprising increase. It is an encouraging indication of what might be expected if our wood pulp were admitted into the United States free of duty.

Editorial Short Lengths for Busy Readers

Statistics covering the output of lumber in the Saginaw valley district, Mich., for the year 1910 show that there was a considerable increase over the previous year and that the cut was the largest since 1904. The Bay City mills cut 112,997,395 feet and the one mill at Saginaw sawed 10,500,000 feet. Of this amount 4,764,000 was pine, 71,391,000 was hemlock, and the balance hardwood. There is one shingle mill left in the valley and its cut was 10,064,0000 shingles. During the year, 93,698,912 feet of lumber arrived by water, of which 75,400,000 was from Canada and paid a duty of $1.25 a thousand. The balance came from Lake Superior mills. In the early eighties Bay City was the greatest lumber shipping port on the Great Lakes, but last year not a cargo was shipped out by water. Practically all of the rough lumber cut in local mills or imported was worked up in the local planing mills and factories and shipped out by rail in the form of dressed lumber or other finished products.

Mr. F. J. Campbell, general manager of the Canada Paper Company, Windsor Mills, P.Q., in a letter dealing with trade conditions, says: "It is impossible to give a forecast of the paper business for the coming season with reciprocity threatening to upset all our present arrangements. Reciprocity in paper, extended as far as the free exchange of wood, of pulp and of news paper, as was asked for in many places and was generally expected, would have caused but a slight disturbance, but when, for reasons unknown, Mr. Fielding agreed to the free exchange of paper to the value of 4c. per pound, the very existence of every book paper and cheap writing paper mill in this country is threatened. Already this is being felt. American houses are establishing agencies in this country, and publishers and others using paper are holding up their orders, looking for a drop in the market.

"We have had a good season in this part of the country for the timber end of our business, and our timber is now on the ice waiting for the break-up, which looks as though it would be particularly late this year."

We hear that the Pacific Lumber Inspection Bureau will shortly be issuing a new export price list, which will be known as "List G," says the Timber Trades Journal. Users of this wood will probably be sorry to learn that this list will be on an advanced scale. Under the trade terms of either Columbian or Oregon pine, according more to the point of shipment than the source of the log supply, the wood of the Douglas fir seems to be increasing in favor in this country for constructional and other purposes. The northern wood, of course, is usually regarded with the greater favor, and discrimination as to the source of supply is an advisable precaution. The present high freights stand in the way of an active demand on this side, although to the advantage of holders who have stocks already landed here. When the Panama canal is finished and the long voyage, by which the wood is now handicapped, greatly reduced, Douglas fir will, we venture to predict, then play a much more important part in the wood trade of this country than it does at the present time. As it is, the production in Canadian territory alone aggregates close upon 190,000 standards yearly.

Lumber Industry in New Brunswick

Fiftieth Annual Report of Crown Lands Department—Exports Show Slight Increase—An Average Cut Expected — Monthly Scaling Returns to be Required

The fiftieth annual report of the Crown Lands Department of the Province of New Brunswick contains as usual much of interest to lumbermen. The details of the receipts of the Department were published in the "Canada Lumberman" of March 15th. The total receipts were $494,491.64, which was an increase of $99,208.06 over those of the year 1909. These figures are for the fiscal year ending on October 21st.

The Surveyor-General, Hon. W. C. H. Grimmer, in his report, writes as follows, regarding the lumber industry:

The Lumber Industry.

As will be observed from the statement submitted herewith, the total receipts from territorial revenue exceed those of the preceding year by nearly $100,000 and are the largest in the history of the Department. The increase is largely due to a more systematic method in scaling of the logs upon which stumpage is charged, as there is nothing to indicate that there was any more lumber cut on Crown Lands last year than had been in the past with the exception of the years 1908-09 and 1907-08, when the cut was considerably below the average. The total quantity of lumber exported from the Province of New Brunswick during the last year was less than the average as nearly as can be ascertained, and there is not as much on hand in the St. John, Miramichi and Restigouche ports as there was last year at this time.

As stated in former reports, the lumber industry of the Province of New Brunswick is dependent largely upon the activity in other lines of business and is materially affected by the political situation in England as well as the United States. We feel that during the coming year we can look forward to an advance in price in the English spruce deal market as matters become more settled politically. Our market in the United States, which has been off for the past year, does not show any improvement at present and the future for the coming year not any too bright, especially where our short lumber is concerned, shingles, etc. In fact, the cedar cut on the Crown lands of the province of New Brunswick this year will be 20 million superficial feet less than usual owing in a very large measure, as stated above, to the unsettled condition of the American market. Although we must take into consideration that our cedar shingles manufactured in the Province of New Brunswick are now in direct competition with the cedar from the Pacific coast, which can be landed in New York at about the same figure as the provincial cedar and is considered by builders there to be a much better article, at the same time we must also take into consideration that nearly every month there is a new form or style of roofing material placed on the market to take the place of shingles, and in the near future it will be necessary for the manufacturers of this province to put the cedar in some other form than shingles. Prices in the English spruce deal market are very little lower than this time last year. There is a fairly steady demand and stocks on hand on both sides of the water are somewhat reduced. It would, therefore seem that conditions warrant us to look forward to nearly an average cut for the coming season.

I have given orders this year that monthly scaling returns must be signed by the foreman of the various camps, and notified every Crown land lessee, before the logging season began, of such intention, with the object of obtaining a correct account of the logs yarded and hauled to stream, and at the same time enabling the scaler to come to an agreement with the operator at the end of each month as to the correct number of pieces so yarded or hauled, and I have every confidence that this new departure will produce beneficial results and will put an end in a large measure to the disputes and necessary investigations, which naturally arise when the stumpage bins are presented. So far the lumbermen are meeting me more than half-way and I have every confidence that the new regulations will work out satisfactorily to all concerned.

Acting upon numerous applications made to my department last year to grant licenses to cut undersized lumber in certain sections of the province, where the growth was known as thicket or stunted growth, as well as heath growth and lumber growing on barren lands, I gave orders that such lands be first examined and if found as represented permission was granted to cut down to certain sizes. The results have been anything but satisfactory and it has been found that licensees would not confine their cutting to the lands described in their application, but would extend their operations indiscriminately to good growing lands and thus deplete the forests that in time would produce good saw logs. My experience has been so disappointing in this respect that in the interests of the province I feel convinced the only true policy of lumbering is to confine our operations to the cutting of merchantable logs and remove as much as possible of the tops of the trees from the forest, thus conserving the young growth. It is only in this way that our forests will rotate and keep up the supply in years to come.

In many parts of the Crown domain it would be highly beneficial to cease cutting entirely for a term of years to enable the young growth to arrive at maturity and the time will come when some such policy must be carried out. I have information that a considerable extent of the Crown lands is of this character and might mention such rivers as the Bay du Vin, Barnaby, Cains, Canaan and all rivers in Kent county east of the Intercolonial railway.

The Fire Problem.

The province has been singularly exempt from forest fires during the past year. Copious rains fell all over New Brunswick in the danger time of May and June, and in the fall month of October, thus preventing the spread of fires. Notwithstanding the kind act of Providence, it is my opinion more stringent fire laws must soon be put into execution. The sad lesson is before us of the most destructive forest fires in the history of the western United States with appalling loss of life that occurred during the past summer. It has been estimated that many millions of dollars worth of property has been destroyed and a large number of lives lost in fighting these fires. Sooner or later some such conditions will overtake us and it behooves us to pass such legislation, formulate wise regulations and vote the necessary appropriations to enable us to combat the fire monster when he does come. We have only to recall the ravages of the Miramichi fire of 1825 to remind us that such a calamity might again overtake us. It is true we are spending a large amount in the maintenance of the present permanent system of game and fire wardens, but there is still much to be done. The State of Maine during the last few years has seen fit to expend largely in installing forest telephone stations. I have made enquiry into the cost of this service and find it to be from $30 to $40 per mile for line building, and from $400 to $1,200 each for stations of which they have 25, employing 200 patrolmen. These stations are located on mountain peaks so that when a fire breaks out it can be quickly discovered and its location telephoned to forest wardens. My recommendation is that a few of these stations be installed during the coming year with depots containing implements for fighting fire and I have no hesitation in saying that such a service properly worked out will be in the very best interests of the welfare of the province.

Another important matter is the matter of protecting private timbr lands from fire. My policy has been when a fire started to instruct wardens to employ the necessary force to put it out at once from Crown lands, or on private lands whereby Crown Lands were threatened. In the State of Maine, where the lands are altogether in private hands, a new enactment provides an annual fire tax of one and one-half mills on the dollar value of the timber lands. It seems to me that some such law will be demanded at no distant day, as the principle of guarding private property by Government money is not sound, and cannot be entertained. Again, I feel that many owners of private timber lands would welcome a departure of this kind if the law could be made general and thus provide a feeling of security to those who have their money invested in property of this kind. It has also been suggested to me that lessees of Crown timber lands should share in the protection from fire, somewhat on the same lines as that adopted by the Province of Ontario, where the Government and lessees bear an equal expense.

Segregation of Lands.

During the year orders for examination of soil have been sent out by this Department before granting orders of survey. In nine cases out of ten the reports have been favorable, that is, that 50 per cent. and over of the land is suitable for agriculture. I have reason to believe that much of this land is unsuitable for agriculture, notwithstanding such reports. The soil in many cases is but a thin covering providing fair crops perhaps for a few years, but easily worked out, and it is not hard to imagine that after a short period the land is abandoned after perhaps burning up in the neighborhood of the lots, lands which should have been set aside for the growth of forest. I have in previous reports recommended a more permanent policy in this respect and during the coming season it is my intention to make a start on these lines under the direction of competent persons.

Renewals of licenses to cut timber which expired on August 31, 1910, were granted for a total of 10,003¾ square miles. On the Blue Bell renewals were granted for 65½ square miles. New applications were granted for 112½ square miles. These make a total of 10,181¾ square miles now under timber license. The fee for renewals is $8 per square mile. The total receipts from timber licenses were $81,057.

The following table shows the quantities and kinds of lumber cut from Crown lands, for which stumpage bills were rendered during the year ending October 31, 1910, with the amount of stumpage charged thereon·

Kinds of Lumber	Stumpage.	Quantity.
Spruce and pine logs	254,866.04	200,599,402 sq. ft.
Fir logs	32,182.68	40,228,360 sq. ft.
Hard wood logs	1,999.41	2,249,265 sq. ft.
Cedar Logs	30,994.38	24,795,508 sq. ft.
Hemlock logs	1,508.02	3,770,052 sq. ft.
Hemlock peeled		8,868,415 sq. ft.
Spoolwood	964.32	1,205,400 sq. ft.
Wood (fire and pulp)	1,318.88	3,791 cords
		281,716,402 sq. ft.
Hemlock bark	3,908.80	4,886 cords
Sleepers	5,694.07	227,763 pieces
Telegraph poles	73.10	443 pieces
Boom poles	44.65	2,280 pieces
Brackets	25.50	2,250 pieces
	$333,579.85	
Add old accounts	2,078.05	
	$335,657.90	
Deduct unpaid accounts	5,297.62	
Paid Receiver-General	$330,360.28	

News of the Trade in New Brunswick

Active Preparations for Coming Season's Business—St. John Log Driving Corporation to Handle 100,000,000 Feet

Debec, N.B., March 21.—The present season has been a remarkably favorable one for the lumberman, so far as the cutting and hauling of logs is concerned. With considerable frost and not too much snow, there has been all this winter easy access to the most remote sections, consequently the small operators and the farmers have cut and hauled a larger supply of logs than usual.

Mr W. L. Kenedy is stocking, and intends to operate the saw mill at Debec Junction this spring.

Mr. A. P. Stevens, whose mill was destroyed by fire about a year ago, has rebuilt on the same site at Union Corner. This mill is situated just across the border on the Maine side, and the output has to be hauled to Houlton, Maine, a distance of six or seven miles, to be marketed

Flemming & Gibson Company, Limited, are carrying on quite an extensive lumber operation at Maudsley, near McAdam Junction. This firm have purchased a new portable outfit, and have been sawing for some time

Mr. Albert Hayden, of Woodstock, N.B., who recently lost his saw mill by fire, is rebuilding. There have been extensive lumber operations carried on this winter on the head waters of the St. Croix and tributaries. Most of this will be taken down the St. Croix river, to be used for pulpwood. Considerable quantities of telegraph and telephone poles are being landed at the various stations along the line of the C.P.R. Railway ties are also in good demand.

The annual meeting of the St. John River Log Driving Company will be held at Fredericton, N.B., on April 5.

President J. Fraser Gregory reports that the company expect to handle about 100,000,000 feet at the Fredericton booms, this amount including both the old and new logs. From last season's operations there are about 30,000,000 feet of logs hung up in the upper St. John river to come to the Fredericton booms for the mills there and at St. John. In the big jam above the corporation limits there are said to be between 20,000,000 and 25,000,000 feet, part of this amount being for the up-river mills, and the rest being part of the amount of old lumber for the Fredericton booms.

On account of the large amount of logs held in the main river above the corporation limits since last season a number of piers have been erected at Ouillette Bar, about 15 miles from the mouth of the Allegash, in the hope of holding the logs so that they will not come out with the ice. Arrangements will also be made for the drift drive on the lower end of the river and a larger crew than usual will probably be sent out on account of the large amount of lumber held in the main river.

At the annual meeting of the St. John Log Driving Association tenders will be called for the log driving contract on the lower corporation from Grand Falls to the booom limits. Mr. John S. Scott's contract for the driving has been completed and he will, it is stated, not tender again. It is believed that there will be a number of tenderers for the contract.

Mill owners are preparing for their season's operations. One of the mills, that at St. Mary's, owned by the Babbitt Estate and operated under the management of Mr. Harry Hoben, commenced sawing about the middle of March, and will manufacture about three million feet this season.

The York & Sunbury Milling Company's mill at Gibson will commence sawing about the first of April and will manufacture between four and five million feet this year.

Some time ago the announcement was made that the Scott Lumber Company's Victoria mill would be operated this year. There is every indication that the prediction will prove correct. A definite announcement is expected in a day or two.

The Phoenix mill will not start operations until logs stranded last summer in the upper St. John river arrive.

Lumbermen have been considerably surprised to hear that it is now feared that the roads on the upper St. John, on which the log-haulers have been operating, will not last, and that some of the cut cannot be taken to the landings. Some of the lumber operators in northern Aroostook county, Maine, are having difficulty in getting their season's cut of logs to the landings, and the St. John Lumber Company, of Van Buren, will leave about 3,000,000 feet of logs on the yards on two of their operations.

At both of the operations, one of which is on Little Black river, steam log-haulers are being used, and the difficulty comes in the fact that the roads will not last long enough. To successfully operate the haulers it is necessary to have a good roadbed, and the operators find that the snow is fast wearing away.

On the Little Black river the St. John Lumber Company made a cut of about 5,000,000 feet of logs for the mill at Van Buren. They have already landed 2,000,000 feet on the river, and are at present working on the third million. After that is out it is expected that the rest will have to be left until next season. Men are working night and day on this operation. Two shifts handle the work and the log hauler makes four trips every 24 hours on a 12-mile haul from the yard to the river, where the logs are landed. The haulers make an average of 96 miles a day.

The other operation, which is being conducted by Flavien Chouinard, is having the same trouble, and the hauler there is being worked over time. It is expected that the operator will have to leave about 1,000,000 feet of logs on the yards.

Indications are that the main St. John river will be open to the log drives earlier than usual this spring. Last fall when it froze over for the winter the water was unusually low, and practically only the channel is filled with ice at the present time. With the spring rise in the water the ice will break up and melt away more quickly than usual.

Lumbermen in northern Maine are praying for rain and a lot of it, and they feel that if it is not forthcoming there will be difficulties with the spring drives.

The Maritime Lumber Co., Limited.

The business of the Thomas Nagle Lumber Company, Limited, of St. John, N.B., and Montreal, Que., has been taken over by the Maritime Lumber Company, Limited. The St. John office of the company is in the Globe-Atlantice Building, and the Montreal branch is at 180 St. James street. The contractors of the new company are as follows: St. James street. The directors of the new company are as follows: President, R. O'Leary; 1st Vice-President, F. B. Black; 2nd Vice-President, Geo. W. Keddy; Directors, S. H. White, W. S. Montgomery; General Manager, Thomas Nagle. The capital stock of the company is $500,000. It is reported that the company will open a branch at Toronto.

Second Call for Death Emergency Fund

The death emergency fund which was recently inaugurated by the Concatenated Order of Hoo-Hoo, has during the past few months sustained numerous calls from beneficiaries. The total receipts from subscriptions up to March 13th were $7,871.62. The expenditures up to the same date included $337.38 in postage, printing, etc., and $3,750 in payments to beneficiaries. This leaves a balance on hand of $3,784.24. The managers of the fund have therefore decided that it will shortly be necessary to issue a second call. The notices for this call are now being printed and will probably be sent out during the month of April. Beneficiaries of subscribers to the first call will be entitled to the benefit of death payments in case of death within 15 days after the date of the second call.

After that date, only beneficiaries of those who subscribed to the second call will be entitled to payments. For this reason special attention is drawn by the managers of the fund to the fact that subscribers between now and the second call will receive very little benefit for their subscriptions. Inasmuch, however, as they have had the opportunity to subscribe ever since the date of the first call, it is considered as their own fault if they have failed to take advantage of this unique and attractive death emergency fund.

Forest Protection in Quebec Province

Season of 1910 a Most Satisfactory One—Practical Immunity from Serious Fires—Lookouts and Telephone Systems Established by Lumbermen

The report of the Forest Protection Branch of the Department of Lands and Forests of the Province of Quebec, prepared by Superintendent W. C. J. Hall, for the year 1910, has been issued. It is in part as follows:

The past season has been a most satisfactory one. The province has been practically immune from serious forest fires, thus standing out in marked contrast to our neighbors, who have been very severely injured by the firey element.

The weather in the spring was rather wet until the leaves and grass had got fairly started, and during the summer rain fell in a well distributed manner, but in moderate quantities, so that although the lakes and rivers kept constantly lowering, sufficient humidity was present to give the rangers good facilities for extinguishing incipient fires. It is very gratifying to be able to affirm that the rangers took every advantage of these favorable features, as is evident by examining the list of fires attached.

That so many incipient fires were snuffed out speaks volumes for our system, as it demonstrates that the rangers were on the spot at the critical moment, and thus in many instances averted what might have been disasters, such as befell tracts in the United States and our sister province, Ontario. Every year the limit holders realize more and more the importance of thoroughly patrolling their areas. Some who have been negligent in the past are very zealous to-day, and let us hope that from this time on it will be a difficult matter to find a limit-holder neglecting his interests.

As usual, we have had some convictions for infractions of the law, but the Department has not been aggressive or harrassing; it is quite necessary to make examples here and there, but the fines imposed have been light; let us hope they will be sufficient, and that the Department will not be obliged to resort to more severe measures.

The rangers along the construction of the Transcontinental Railway discharged their duties well, as the absence of serious fires indicates plainly. The use of "speeders" proved a success. We distributed a full quantity of linen posters in French and English; also in the Montagnais and Algonquin Indian dialects. Owing to circumstances beyond control, it was impossible to supply rangers with canvas buckets and steel shovels this year, but we hope to accomplish this next season without fail.

The pamphlet compiled by myself and assistant was distributed to the lumbermen, the clergy, the municipalities and the rangers, and had a good effect. The Transcontinental Railway authorities took a goodly number on their own account, and distributed them to the contractors and workmen. Circulars to mining prospectors were supplied to the Department of Colonization, Mines and Fisheries, and by it distributed to interested parties.

Lookouts and Telephone Systems.

The firm of John Fenderson & Company established a lookout station on a prominent elevation a few miles south of Lake Matapedia, on lot 2, range III., Nemtaye, 1,700 feet above lake level, 2,200 feet above sea level. A steel watch tower has been placd in position on the top of this hill, connected by telephone with the village; from this station one can see some 60 miles in various directions, less in others, but at least 1,000 square miles can be overlooked from this point. As far as we can judge it is an ideal station, and the enterprise of this firm cannot be too warmly commended. The River Ouelle Pulp & Lumber Company has installed the telephone system over a large part of their limits and finds it to be of very great assistance indeed. We would like to see a large number of limit holders follow these good examples.

Injurious Insects.

During the past season it became apparent, from reports received, that the spruce-bud worm had increased enormously and was threatening our forests. Happily it was ascertained that a parasite was preying on this insect and the entomologists assert that it is rapidly increasing in numbers. Cultivation of the parasite seems to be the only practical means of combatting the attacks of this insect, as it is out of the question to spray forests in the aggregate. Owing to the presence of the parasite we may reasonably expect that our forests will not suffer such damage as the larch saw-fly inflicted on the tamarac years ago. Further investigation showed that the deciduous forests were also suffering from the attacks of insects; the tussock moth was observed in the forests near Lake Megantic, the tent caterpillar north and northeast of Montreal, some leaf-rolling insect affecting the alders in the National Park and vicinity (name not ascertained), and the oaks, ash and elms in and around the city were observed to suffer considerably from lice on the leaves.

It must not be construed from these remarks that a sudden invasion of insects has taken place in our province; the fact is we have had most of them for some time. It is simply that more attention has been given to the matter lately owing to the advent in our midst of the spruce-bud worm. I see no reason, therefore, for being greatly alarmed, as it is likely the entomologists will be able to affirm that in this latitude these destructive insects can have but one brood during the season. The extreme temperature in winter, and the prolonged cold weather, militate against these insects spreading too rapidly or to too great an extent in our climate.

The law protecting insectiverous birds should be most rigidly enforced throughout the province, as they prey very largely on these forest destroying larvæ. I do not think we can be too emphatic on this point.

Defective Engines and Steam Shovels, etc.

The railway companies have been much more careful this year than formerly, judging by the smaller number of fires reported from along the various lines where construction has been going on and steam shovels are in use. On spurs extending right into the forests from the main line, a certain amount of damage has been sustained. Investigation into these matters always brings forth the statement that the netting has been examined and found to be in good order and condition, etc., etc.; nevertheless we have the unimpeachable evidence that thy throw out dangerous sparks and cinders.

The danger points on a railway are the grades, of course. Here it is that engines are pushed to their limit hauling heavy loads; I think it would be well for the railways to supply profiles of their roads, indicating the grades, and then we could ask them to give special attention to these dangerous spots. I have no doubt that they would be perfectly willing to do so, as it is no part of their interest to see the forest consumed by fire.

Comparison of Results in Other Provinces and Countries.

The forest fires which occurred during 1910 in the northwestern states are said to have been the most serious ever known there. The damage to timber alone, outside of destruction of young growth and soil, was enormous; but when one adds to this the property loss, the figures are simply appalling. The most regrettable feature of all was the great loss of life in these conflagrations.

The lowest estimate places the loss of timber alone at 175 million dollars, representing the cut of two years, or the growth of six years on all the existing forests in the United States; the cost of extinguishing these fires is estimated at one and a half million dollars.

In British Columbia over 725 fires were reported and over $80,000 expended in fighting them by the Government. Private individuals spent some $20,000 for the same object. The losses were heavy. Our sister province also suffered severely, the fires being largely traced to railways. Unlicensed lands escaped fairly well, but the limit holders and settlers were badly scorched. The property losses along the lines of railway were heavy, stations, tanks, bridges, etc., etc., being licked up by the flames.

Summary of Fires in Season 1910.

Origin.	Number.
Settlers' fires	25
Locomotives	21
Steam shovels	46
Sportsmen	9
Lightning	4
Not stated	25
Mills	5
From railway right of way	3
Unknown	12
Passers-by	7
Road makers	2
Log drivers	1
Pipe ashes	1
Contractors	3
Section men	2
Smudges	4
Choppers	1
	171

In comparison with the losses sustained by other countries, our own are very small indeed; in fact, the smallest known since efforts were made systematically to protect our forests. We must extend our fullest sympathies to the sufferers, and congratulate ourselves on results achieved. In this connection full credit must be given to the zeal displayed by the lumbermen and the staff.

Preservation of the forest is easily the most important forest problem in America to-day. The menaces to the forest are one hundredfold greater now than they were a century ago. The area denuded at present is immense. Evaporation over this vast expanse has in consequence increased enormously, with the inevitable result of lessening the volume of water in the lakes and rivers, thus causing the forests to be more inflammable. With the population of North America at, say, one hundred million souls, and rapidly increasing, how long will the ever decreasing supply of timber last, granting for the sake of argument that serious fires do not occur in the future, which is too much to expect.

One conclusion only can be drawn, viz.: that conservation in the strictest sense must be exercised, and every nerve should be strained towards that object, so that we may at least be able to say that no efforts were spared to accomplish that object. We must be prepared to expend a reasonable amount to safeguard our interests.

Of the above, 111 were incipient fires, or say, nearly 65 per cent.; there was actually only one fire of any magnitude in green timber. Taking all the fires together, an area of less than five (5) square miles was affected. The damage done was slight, fire running in old burns, or being snuffed out in the incipient stage, and at the most could only amount to a trifle.

Although we had but few fires, it must be remarked that we also had some pretty dry periods; e.g., near Lake Masketsy, north of Hervey Junction, fire was noticed on 15th July and extinguished supposedly. This same fire broke out in August, was again apparently put out, and once more started up, but was effectually extinguished about the 28th August.

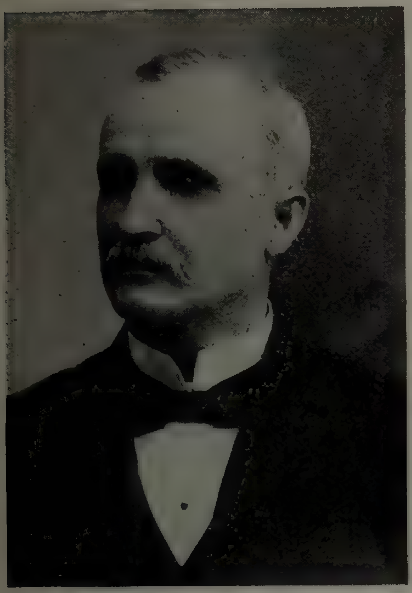
Municipalities.

If the laws could be framed so that municipalities were responsible for all fires occurring within their boundaries, much good would result, as it is evident to anyone who has given the subject study, that the villages bordering the timber are most prolific in the way of fires, because in these places there is more burning of debris necessary than in settlements of greater age and, moreover, these latter ar more remote from the forests. By making some one responsible, be it an individual or a corporation, we get as a result more protection and more patrolling and supervision; more care taken of the forests.

The rainfall for the past fire season registered 23.66 inches; in 1909, 21.46; in 1908, 18.87.

Ottawa Lumberman Called by Death

Mr. Peter Whelen Succumbs After Brief Illness—Half a Century in the Lumber Business of Ottawa Valley



The Late Peter Whelen, Ottawa.

Lumbermen in all parts of Canada will learn with much regret of the recent death of Mr. Peter Whelen, of Ottawa, one of the foremost lumbermen in the Dominion and a man who had made, not only in the lumber trade, but throughout commercial circles in Canada generally, a host of warm friends and admirers. Mr. Whelen had been ill for a little over a month. About the end of January he contracted a severe chill which resulted in œdema of the lungs. From the first it was feared that the illness would have fatal results, and it was soon seen that there was no hope of recovery. Mr. Whelen remained conscious until the end and at the time of his death, on the morning of March 17, was surrounded by members of his family.

The late Mr. Whelen was born in Ottawa in 1849 and was the only son of Mr. Geo. Whelen, contractor, of Ottawa, who came from the county of Mayo, Ireland. His parents died when he was but a boy. He entered the lumber business early in life and became one of the pioneer lumbermen of the Ottawa valley. At the time of his death he had been continuously engaged in the lumber trade for nearly half a century. Among lumbermen he was acknowledged to be one of the most practical of the old school, who learned the business from the shanty to the mill. When a mere youth, Mr. Whelen advanced to a position of responsibility, as general manager of one of the largest firms in the Ottawa district, the firm of Law & Johnston. Subsequently he became general manager for their successors, Messrs. John Rochester & Company.

For the past 31 years Mr. Whelen had been Canadian manager of the Shepard & Morse Lumber Company, of Boston. In this capacity he bore successfully the heavy responsibilities, which the rapid expansion of the business entailed. It is no exaggeration to say that few men in Canada were equally conversant with the intricacies of the lumber business in all its branches. The Ottawa business of the Shepard & Morse Company, which he carried on so efficiently, included the extensive logging and milling undertakings of that company, and also their large exporting business to the United States, South America, the West Indies and Great Britain. Mr. Whelen not only superintended all this, but also was in charge of the company's extensive purchases of lumber from other saw-milling companies in Ontario and Quebec

In addition to his occupation as a lumberman, Mr. Whelen was engaged in many other lines of activity and took at the same time a keen and practical interest in public affairs. He represented Victoria ward in Ottawa City Council from 1881 to 1884 inclusive. He had a great deal to do with the development of the scheme for lighting the streets by electricity and was first chairman of the electric lighting committee. He was president of the Ottawa Board of Trade, retiring only in January, 1911, on account of his ill-health. He represented the Board of Trade at the convention of Chambers of Commerce of the Empire which met at London, England, in 1906. He was also first president of the Confederation of Boards of Trades and Municipalities and held the office for two years, retiring in February, 1911. Mr. Whelen took an active interest in the Canadian Club movement, and was always a keen supporter of the Young Men's Christian Association and of several sporting clubs.

One of the most characteristic sides of Mr. Whelen's nature was his sympathetic care for all who came under his employment. By none was he better known or more highly esteemed than by his employees and by them he will be missed, more almost than by anyone else.

Mr. Whelen was a thorough Canadian, a loyal British subject, and a man whom his fellow citizens would gladly have honored with one of the highest positions in their gift had he been spared. He was personally known to a great number of the readers of the "Canada Lumberman" and among them all he will be mourned sincerely.

The following resolution was adopted by the Montreal Lumber Association at a general meeting held on March 20th: "That the Montreal Lumber Association has learned with profound sorrow of the death of Mr. Peter Whelen, of Ottawa, and that it records the high regard felt for him by its members, and their appreciation of his nobility of character.

"That the Montreal Lumber Association extends to the bereaved wife and family its deepest sympathy in their bereavement."

The funeral of the late Peter Whelen was held on March 20th at Ottawa, and was one of the most largely attended that the city of Ottawa has ever witnessed. Men of prominence in every walk of life were present at the funeral service and the streets of the city were lined with people as the procession passed. Floral wreaths in great profusion were sent by friends. Among these was a design of a square and compass from the Chaudiere Masonic Lodge, of which Mr. Whelen was a member.

John Marshall, a pioneer lumberman and contractor of Leeds county, died on March 20 at his home at Brockville, Ont. He was in his 93rd year. His son Mr. V. B. Marshall, is president of the Brockville Lumber Company.

The death occurred recently of Mr. C. H. Houle, accountant for the Pugh Livingston Lumber Company, at Dorr, B.C. Mr. Houle was well known in Toronto, which he left a couple of years ago to take a position as secretary-treasurer of the Proctor Lumber Company, of which he subsequently became manager. Mr. Houle was taken ill with typhoid fever while on a visit to Nelson, and died soon after his return to Dorr. He had a large number of friends in Nelson, Proctor and Toronto.

Mr. Norman S. B. Braden, sales manager of the Canadian Westinghouse Company, has been added to the board of the B. Greening Wire Company, Limited.

As an indication of the wide use of the Barnhart Loader. the company refer to the manu manufacturers who have installed it. Among these are such well-known firms as the Great Southern Lumber Company in Louisiana; the J. J. Newman Lumber Company, in Mississippi; the Central Pennsylvania Lumber Company, of Pennsylvania, and the Dominion Sawmills & Timber Company, of Taft, B.C.

Pole Consumption in United States

The Largest Total Ever Reported—An Increase of Over Fifteen Per Cent. During the Year 1910

The total number of wooden poles purchased by pole consumers in the United States in 1909 was 3,738,740, which is the largest total ever reported. The gain over the number reported for 1908 was 489,586, or 15.1 per cent.; and over that for 1907, 455,472, or 13.9 per cent. For the poles purchased in 1909 the sum of $7,073,826 was paid, which, although greater by $1,145,002 than the expenditure reported in 1908, was less by $1,007,942 than that in 1907, when the average cost of poles was greater than in other years. In 1909 the leading kinds of wood were cedar, chestnut, oak, and pine, and poles made of these species formed 92.7 per cent. of the total number purchased, and represented 95 per cent. of the total cost. As in previous years, cedar and chestnut were most important, supplying, respectively, 65.3 per cent. and 16.3 per cent. of all poles purchased in 1909.

For cedar poles a steady increase is shown, but the number of chestnut poles purchased in 1909, though greater than the number in 1908, was less than that in 1907.

Increasing Use of Oak Poles

The growing use of oak is notable. In 1907 only 76,450 oak poles were reported, while the number was 160,702 in 1908 and 236,842 in 1909. Other kinds of wood for which steady gains are shown since 1907 are juniper, tamarack, Douglas fir, and osage orange. For cypress, on the other hand, annual decreases were reported. More redwood poles were purchased in 1909 than in 1908, but considerably fewer than in 1907.

The three classes of consumers are credited with about the same proportions of the total number of poles purchased in 1909 as in 1908. In 1909, as in previous years, by far the most important of these classes was that comprising the telephone and telegraph companies, which purchased 2,916,005 poles, or 78 per cent. of the total number reported. The electric railroad and electric light and power companies bought 627,414 poles, or 16.8 per cent. of all poles purchased in 1909, and the steam railroad companies, 195,321 poles, or a little more than 5 per cent.

Since 1908 there has been an increase of 13.8 per cent. in the number of poles purchased by the telephone and telegraph companies and an increase of 18 per cent. in the number purchased by the electric railroad and electric light and power companies, while the largest gain, 25.7 per cent., is shown for the steam railroads. In comparison with 1907, however, only the purchases of the telephone and telegraph companies show an increase. The large gain in the returns for these companies is due partly to the omission in 1907 of data for many companies using only short poles.

Cedar and chestnut poles were bought extensively by each class of consumers. The telephone and telegraph companies used a wide variety of woods, reporting relatively large numbers of oak poles, nearly all the poles made of osage orange, and most of those made of tamarack. Among the poles purchased by the electric railroad and electric light and power companies pine poles exceeded in number those of any other species except cedar and chestnut. These companies bought comparatively few oak poles, the number being smaller than in the preceding year. Pine poles were also very prominent in the purchases of the steam railroad companies, nearly equalling the number of cedar poles bought by them.

Average Cost Increasing

The average cost of all poles purchased was $1.89 in 1909, as compared with $1.82 in 1908 and $2.46 in 1907. The somewhat high cost in 1907 is accounted for in part by the lack of complete statistics for that year as to the purchases of short poles, which, of course, have a low average value.

For the telephone and telegraph companies the average cost of poles purchased in 1909 was $1.40 per pole; for steam railroad companies, $2.83; and for the electric railroad and electric light and power companies, $3.89. The variations in these figures indicate in a general way the differences in the size or grade of the average pole suitable for the purposes of the different classes of companies.

Of the total number of poles purchased in 1909, nearly one-third were from 20 to 25 feet in length, and more than one-fourth were from 25 to 30 feet in length. Poles under 30 feet in length constituted nearly three-fourths of all poles purchased, while less than one-fortieth of the total number had a length of 45 feet or over.

Cedar was the leading kind of wood in all lengths of poles purchased. Of the oak poles, more than 92 per cent. were under 25 feet in length, and by far the largest part were less than 20 feet in length. Osage-orange poles and those of the species classified under the head "All other" were also purchased, principally in the short lengths. Many of the oak and osage-orange poles were used by rural telephone lines or by the so-called "farmers' exchanges."

An increase in average cost since 1908 is shown for each group of poles having a length of 30 feet or over. On the other hand, poles under 20 feet in length cost 56 cents per pole in 1909, as compared with 62 cents in 1908, and poles from 20 to 25 feet in length 82 cents in 1909 as compared with 84 cents in 1908, while for those from 25 to 30 feet in length the average cost was the same in both years.

Of poles having a length of 45 feet or over, Douglas fir poles were purchased for the lowest average cost, while among the shorter lengths the lower priced woods were tamarack, locust, oak, and osage orange. The high average cost of pine poles was due to the fact that large numbers of these were treated poles. Redwood poles had a uniformly high average cost. These were probably mostly sawed, as over 98 per cent. of redwood poles were so reported in 1908

Preservation

An important factor in determining the value of a pole is its ability to resist decay, especially when in contact with the soil. Although durable woods are generally preferred as pole timbers, there is an increasing tendency to purchase species, especially the pines, which are naturally less durable, and to render them less liable to decay by means of a preservative treatment.

Poles may be treated by applying the preservative with a brush, by dipping them in a tank containing the preserving fluid, by standing them in an open tank and securing an absorption of the preservative by periods of heating and cooling, or by the application of pressure to a closed cylinder containing the poles and the preservative.

There is a wide variation in the efficiency of the various preservatives used and of the methods of their application. The resulting increased service secured varies accordingly from a few years to more than twenty.

For some species and for poles intended for use in regions where they will be particularly liable to decay, as in some of the southern states, a thorough impregnation of the entire pole with the preservative is often most economical.

By far the greater number of the poles reported as treated were made of those timbers which have a naturally long life and were given a light treatment, adding comparatively few years to the life of the pole. It follows, therefore, that the advance in pole preservation as measured by added length of service has been much less in the United States than would be inferred from the number of treated poles reported.

With regard to the number of poles which were treated by the open-tank process no statistics are available; but this practice is known to be increasing.

Reports to the Forest Service from 62 commercial and private treating plants show that in 1909 about 1,123,000 linear feet of pole timber equivalent to 44,920 poles 25 feet in length, were creosoted under pressure with from 8 to 20 pounds of oil per cubic foot of timber; and that, in addition, several hundred thousand linear feet were given a treatment with creosote oil and a zinc chloride solution combined. The plants reporting poles treated under pressure were all in the southern states and the wood used was chiefly southern yellow pine. No reports were received from three southern plants which also treated poles by this method.

Varieties of Preservers

Among the preservatives reported by the companies which purchased poles were creosote, coal tar, crude oil, various kinds of carbolineum, and other patented preservatives.

Of the poles reported in 1909, 576,631, or 15.4 per cent., received treatment before or after purchase. This represents an increase of about 232,000, or 67.4 per cent., over the number reported as treated in 1908, and an increase of 180,432, or 45.5 per cent., over the corresponding number in 1907. In 1908 treated poles formed 10.6 per cent. of the total number of poles reported as purchased, and in 1907, 12.1 per cent.

Each class of consumers reported more treated poles in 1909 than in 1908, the percentage of increase being greatest in the case of electric railroad and electric light and power companies.

Telephone and telegraph companies reported that treated poles constituted 12.5 per cent. of their purchases in 1909, as compared with 8.5 per cent. in 1908, and 10 per cent. in 1907. Although these companies use the greatest number of treated poles of any of the several classes of consumers, the proportion which these poles form of their total purchases is the smallest reported for any class.

Of the poles purchased by electric railroad and electric light and power companies in 1909, 24.2 per cent. were reported as treated, while in 1908 and 1907 treated poles formed respectively 14.7 per cent., and 12.4 per cent. of their purchases. These companies use poles of high average grade and value.

The steam railroad companies reported that 31.1 per cent. of all poles purchased by them in 1909 were treated, which was the highest proportion reported by any class of consumers. In 1908 the percentage of treated poles for this class of consumers was 30.9, and in 1907 it was 27.6.

Foreign Lumber Trade of the U. S.

Exports to Canada Doubled In Spite of Substantial Decrease in Average Price—Imports Increasing

The following record of imports and exports by the United States, with reference to wood goods, for the year ended December 3st, 1910, has been prepared by the secretary of the Canadian Lumbermen's Association. A brief analysis of the figures is published in the editorial columns of this issue:

Imports.

Gross imports into the United States $1,562,924,251
Total imports of wood and manufactures of wood 54,489,711
Or: 3.49 per cent. of total imports.

Logs and round timber—

	Value.
1908	$1,175,709
1909	1,540,129
1910	2,170,770

Boards, planks, deals and other sawed lumber—

	Value.	Av. price per M. ft.
1909	$18,265,983	$18.44
1910	17,764,049	18.69
Decrease in 1910	$501,934	

Laths—

	Value.	Av. price per M.
1910	$1,717,447	$2.50
1909	1,184,498	2.47
Increase in 1910	$532,949	

Shingles—

	Value.	Av. price per M.
1909	$2,109,235	$2.35
1910	1,470,893	2.18
Decrease in 1910	$638,342	

Pulpwood—

	Value.
1910	$6,109,574
1909	5,613,710
Increase in 1910	$495,864

Wood Pulp—

	Value.
1910	$13,296,500
1909	10,315,089
Increase in 1910	$2,981,411

Of these Canada supplied in

	Value.
1910	$4,966,536
1909	3,883,877
Increase in 1910	$1,082,659

Exports.

Gross domestic exports by the United States $1,827,255,669
Total exports of wood and manufactures of wood 85,789,033
Or: 4.69 per cent. of total exports.

Logs, round timber and timber hewn and sawed—

	Value.
1910	$14,858,998
1909	13,600,576
Increase in 1910	$1,258,422

Of this Canada took in—

	Value.
1910	$1,638,742
1909	1,248,244
Increase in 1910	$390,498

Boards, deals, planks, joists and scantling—

	Value.	Av. price per M. ft.
1910	$41,675,785	$21.93
1909	32,856,078	21.40
Increase in 1910	$8,819,707	

Of this Canada took in ....Value.

	Value.	
1910	$7,670,201	$25.54
1909	3,770,066	27.84
Increase in 1910	$3,900,135	

Exports of Pulpwood etc. to the United States

In the House of Commons recently statistics were made public, of the exports of pulpwood, wood pulp, and paper from Canada to the United States during the years ending March 31, 1909 and 1910. These statistics were erroneous as they related to the total export instead of the export to the United States. The correct figures, as now made public, are as follows:

1. The exports of pulpwood from Canada to the United States during the fiscal year ended March 31, 1909, amounted to $4,356,391; and during the fiscal year 1910 to $6,076,628.

2. The exports of wood pulp from Canada to the United States during the fiscal year ended March 31, 1909, amounted to $3,064,819; and during the fiscal year 1910 to $4,175,309.

3. The exports of paper from Canada to the United States during the fiscal year ended March 31, 1909, amounted to $958,870; and during the fiscal year 1910 to $1,297,052.

VIEW AND INTERVIEW

Various Opinions on Lumber Affairs

Reduced cut at Ottawa

"Lumber driving on the Ottawa is likely to be later this year than usual," said Senator W. C. Edwards recently in an interview. "This is owing to the exceptional thickness of the ice and the continuous cold weather of the winter." The total log cut this year, he said, would be something less than usual, probably under 500,000,000 feet. The cut would not affect the mill operations this season, however, as there were sufficient logs stored to bring the operations up to the average. The market for the lower grades of lumber, he reports, remains sluggish, and there seems little prospect of an early improvement. The condition of the market, however, was not likely to have any effect on the shipments from Ottawa. The Ottawa valley supplied only about two per cent. of the consumption in the United States, so that the market there would have to be extremely dull before the effect was felt at Ottawa.

Good Times for Western Lumbermen

"This year will prove the greatest in the history of the British Columbia lumber industry owing to the enormous influx of settlers to the prairie provinces," said Mr. John Hanbury,, a well known lumberman, who returned recently to Vancouver from a trip to Winnipeg.

"The most conservative estimates agree that at least 300,000 people will go on the land. The capacity of the railways is already taxed in handling the newcomers who are arriving in Winnipeg or passing through Portal, on the Soo line, in trainloads. It is a certainty that their first requisite will be lumber. Millions of feet will also be absorbed by the various towns and cities which are keeping pace with the growth of the country. Calgary is talking of erecting $10,000,000 worth of buildings this summer.

"Stocks in the interior of British Columbia are about normal. I expect the cut for the entire province will establish a new record. This will mean increased prosperity."

Mountain Lumbermen Alter their view

The Mountain Lumbermen's Association, of British Columbia, recently passed a resolution condemning the reciprocity proposals. This was done when they had not full information upon the situation. The following leter, which explains itself, has now been sent by the secretary of the Association to members:

"It appears that at our annual meeting we did not have correct information regarding the proposed changes in the tariffs of Canada and the United States. It is not intended to change the present Canadian tariff affecting lumber at all. The American tariff will be materially reduced, and, therefore, British Columbia manufacturers will not be placed at any greater disadvantage than we have been laboring under for the past ten years. On the other hand, by reason of the reduction of the United States tariff on shingles the industry in B. C. will derive a substantial benefit, and when the lumber market in the States recovers we shall be in an improved position to cater for some of their trade."

Shipment of Piles to Vancouver

A cargo of Australian turpentine piles is to be shipped to Vancouver, B.C., for use in dock building. The cargo will comprise about 1,600 piles, ranging in lengths from 60 to 75 feet. This is the second consignment of piles from Sydney to Vancouver, the first being about four years ago.

The Retail Dealer and His Problems

Bookkeeping for Retail Yards—Specific Orders

Canadian Wins in Retailers Competition

An interesting competition among retail lumber yard bookkeepers has recently been conducted by the American Lumberman of Chicago, and as a result many excellent articles have been received dealing with methods of bookkeeping. Th most interesting feature of the competition to Canadians is th fact that out of the 59 competitors, the first place was awarded to a Canadian, Mr. William Patricks, accountant for the Vigars-Shear Lumber Company, Limited, of Port Arthur, Ont. Mr. Patrick's article is as follows:

I take pleasure in enclosing a few sample sheets of a system of bookkeeping applicable to a retail lumber yard. These samples, with a few explanatory words I shall make, will, I believe, be clear to you. You will note this covers a manufacturing proposition also, but as we market our product retail, our main efforts have been clear, comprehensive records for the retailer. We could, in fact, quit manufacturing and still make no change in our books. Moreover, this system is built up over a period of years, not thrown in all at once. Therefore the facts it shows are practical facts, not so liable to be red-tape facts.

Taking the journal and cash sheet, it will be seen that this is merely an adaptation of the old synoptic idea and is therefore clear to everyone in principle. You can make subdivision into two, three or four ledgers, just as you like, and by taking advantage of the idea of proving your ledgers by footings rather than balances, you can further subdivide these four ledgers again, making eight sections capable of independent proof. This method shows at once whether an error is in the debit or credit side of any ledger, thus eliminating checking the opposite debit or credit.

The expenses are "keyed" for different classes, and the keys carried in a separate book or register. If the business is small this classification can be carried on the face of the journal sheet, mentioned in the above paragraph, by using a column for each class.

DATE DELIVERED ______________ 19__

ORDERED		Size	Lgth	KIND	DELIVERED		Price	Amount
Pieces	Feet				Pieces	Feet		

Form 1. 7½ x 9 with tissue duplicate and manilla ag triplicate

All orders are taken in the office and entered on triplicate form No. 1 for shipment and invoicing. This is self-explanatory. It absolutely prevents material leaving the yard, as the shipper must have the triplicate form before he can even start loading a load.

After extending the office copies of all invoices for the day they are entered on form 3, and the total of this form for the day charged customers' ledger through the journal. Each office copy is then posted to the customer's respective monthly statement sheet, form 2, the total of which sheet at the end of the month is entered direct to his account in the customers' ledger. The value of this is that at the end of the month you have a statement ready to mail out, that during the month you carry the mass of customers' business by single entry, but have all the safeguards of double entry.

The records as shown on form 3 (material going out) with its opposite, form 4 (material coming in) recapitulated by months shows first; value in dollars of different classes of goods handled, also value per unit. For instance, it permits of comparison between hard and soft woods, which it pays to push. Second, at the end of any month it forms a perpetual inventory. An inventory taken should equal the difference between the two forms. Being loose leaf, can be changed at pleasure to suit one's ideas.

The ideas mentioned above are the essential ones in this system. That is, a subdivision of records for comparative purposes, and a comparison of the same record for two, three or more years is the only comparison that is true and valuable. Your statement at the end of the year will show how many cents gross you made on a dollar's worth of business in pine lumber, as compared with fir, compared with shingles or doors or lath. If this information does not cost too much, it is valuable. It also shows percentages on cost, but these figures are tricky; you can not rely on them for next year. Your statement will show also where your expense money is going, to a sub-division as fine as you want to make it. This, also, is valuable if it does not cost too much.

Form 2. 9¾ x 9¼, net, plus loose leaf margin at left

To summarize: This idea is comprehensive; it shows the gross profits and what lines made those profits and what lines lost them. The money you spent is accounted for, and it is important to know to a practical point where your expense money goes. It is comparative. The comparisons you can get here are limited only by your time and industry. It is elastic. You could add a line of twenty yards and make no change in the books opened in your original investment. You could curtail operations and the system would adapt itself to the curtailed conditions. And, lastly, it is inexpensive to operate, considering results. It is possible to take a big city yard, hire all the bookwork done by employees, and do it for 25 cents a thousand sold. Considering results, that is cheap.

William Patricks,

The American Lumberman in discussing Mr. Patrick's contribution editorially says:

Mr. Patricks' very excellent article, while brief, doubtless will be completely understood by reference to the cuts reproducing the forms submitted. Form No. 1 consists of the customer's invoice, reproducing a tissue copy of it which is not reproduced, and which is punched for a binder, the consecutive invoice number being numbered on this sheet and the amount being carried to the daily sales sheet, form No. 3. It will be noted that the daily sales sheet contains separate columns for the different classifications of merchandise which are used in this case, both in feet and in amount. A similar form is used for material received as a purchase sheet, as a return sheet and as a stock sheet, being form No. 4. A separate sheet is used for each of these three purposes. These sheets are carried to a monthly and to a yearly recapitulation sheet, and, being kept by quantity as well as amount, show actual quantities in their respective classes, which quantities should agree with the physical inventory.

Returning to the customer's invoice, form No. 1, a triplicate of the left side of the invoice is made on manila cardboard as a yard order. In filling the invoice in the first place only the order columns are filled and when the yard order comes back, if any items of the order are not filled or not fully filled, the amount actually delivered is extended and priced.

The contributor's suggestion as to the subdivisions of the ledger may not be understood by some. He means by this that the ledger may be divided into divisions corresponding with various columns upon the columnar journal. Each division of the journal should prove with its column when fully posted, and if any error appears it is confined to that particular section and does not need a rechecking of the entire trial balance. He further suggests taking the balance by totals and, of course, keeping the two sides of the journal account by totals in the same manner instead of by balances, so that any discrepancy will indicate whether it is on the debit or credit side and not necessitate checking both sides. It is, however, much more work to foot forward in this manner and possibly more work than would be required to check both debits and credits for an occasional trial balance error. This is a matter of individual judgment.

Form 2 shows a detailed monthly statement to customers. S. S. No. here means sales statement number, and only one line of the month-

Form 4. Twin Form to Form 3, same size, yellow paper with slight difference in columns

ly statement is used for each sales statement or invoice. This statement is designed for taking care of separate accounts for two or more yards in the same set of statements. For the purposes of a single yard the same thing would be accomplished with the use of but three columns, one for lumber, one for building material and one for a total of these two.

The contributor made pencil quotations on the form which have been erased in engraving it, and which indicate that these monthly statements are started with the first monthly charge to the customer and that after the total for the month's business has been brought down the previous month's total is brought to the statement from the ledger, and any credits for the current month are then deducted. Although this is not fully explained, it is probable that credits for material returned are carried through the daily material return sheet, and instead of being posted direct to the customer's monthly statement when they occur, are credited to his ledger account, and that the total of such credits is brought from the ledger to the monthly statement at the end of the month, together with the previous month's balance and together with any cash which has been paid on account.

At the end of the month as described, the current month's charges are posted to the customer's ledger account and the total of these ledger accounts should then balance with the account of customers on the journal.

The form showing the journal headings merely shows their arrangement and not the proper width apportionment of the columns. It shows a few columns which have to do only with the sawmill business and which, of course, would be eliminated in bookkeeping covering only lumber retailing. The daily sales are brought to the journal from the daily sales register in a single line so that the journal does not fill up rapidly. It would also be advisable to keep a separate petty cash account, carrying it to the journal by a single line entry for each day, for the purpose of condensing the journalizing. It is probable, although Mr. Patricks does not describe it, that a voucher system is used for payments and that the subdivision of expenses is made from the voucher. It would have been interesting had Mr. Patricks fully described this particular feature and given his entire expense classification by numbers.

Taken altogether, the system here described gives the most complete results with a minimum of labor. Dividing the merchandise into classes, it keeps track of it by classes as well as by amounts, thus affording material for very complete periodical statements, showing amount handled, average cost price, average selling price, expenses properly chargeable to each class, etc. It also makes it possible to make a monthly closing of accounts if desired, which would be approximately correct, using for this purpose such quantities as are shown by the stock record and verifying or correcting the stock record annually or semianually by means of an actual inventory.

The best bookkeeping method is that which accomplishes the most complete results in the simplest manner, and the system herein described deserves careful study because of its close approach to the ideal in these respects.

Making Orders Specific

I want to again call attention to the fact that careless methods of giving orders are responsible for most of the troubles arising between buyers and sellers.

The custom of giving an order over the telephone without a written confirmation, or of permitting the salesman to write it and then laying it aside on your desk without being certain that the specifications are fully in accordance with your own understanding, often leads to honest differences, which could be avoided if proper care were used.

Do not depend upon the grading rules to protect you against green and stained lumber in the common grades, but if you want it kiln dried so state in your order and you will then have ground upon which to stand if you get wet stock.

The dealers who use their own order blanks and are careful to make their orders specific as to grade, length, mill work, time of shipment and terms, rarely have a complaint that they are unable to adjust easily and satisfactorily. As has been well said about collections, the first and most important step is to have a perfect understanding at the time the sale is made as to when the account shall be paid and the rest is comparatively easy. The same is true of buying. If there is a perfect understanding between the buyer and seller at the time the order is given the chances for dispute are reduced to a minimum.—President T. G. Pierson, at annual meeting of Indiana Retail Lumbermen.

Eastern Canada Concatenation on April 21

Vicegerent Patterson, of the Concatenated Order of Hoo-Hoo, for Eastern Canada, has decided to hold the next concatenation at Hamilton, Ont., on April 21st. After the success which attended Mr. Patterson's efforts during the past year, it is certain that this concatenation will be interesting and lively. Mr. Patterson is doing all he can to arrange an excellent programme and to induce a large number of members to attend. All who can possibly arrange their plans so as to be present, should not fail to do so. Details of the programme are still under consideration and cannot be announced at prsent. They will, however, be published in the "Canada Lumberman" of April 15th.

The Hindus employed in the mill at Fraser Mills, B.C., are hankering for the sight of a newspaper published in their own language, and several of the more enterprising among their number have decided to establish a weekly sheet. The paper will be published in Hindustani and also partly in English, the idea being to give the Hindus a drilling in the language of their adopted country. Urah Singh is the name of the editor. "The Beacon of Light" is to be the name of the journal.

Readers of the "Canada Lumberman" will join with us in tendering sincerest sympathy to Mr. F. N. Waldie, of the Victoria Harbor Lumber Company, Toronto, on account of the recent sudden death of his wife.

Sir Edward Tennant, who a few days ago was raised to the peerage, when he was made Lord High Commissioner of the Church of Scotland, arrived in New York recently on his way to Vancouver, B.C., to study forestry conditions.

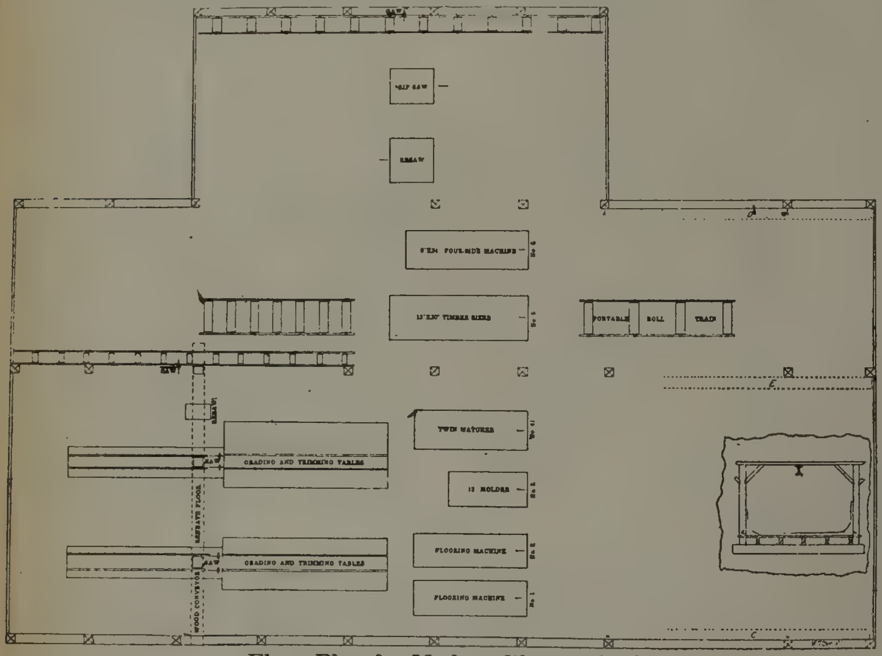
THE WOODWORKER

Specifications for a Modern Planing Mill

By M. C. Cantrell

In presenting plans for a planing mill it is only practical to give general outlines, from which to obtain ideas to apply to a particular plant. The plans herewith are for a medium sized mill, and suited to either shafting and belt or electric transmission, with only slight variations. As conditions in individual cases govern the space allotted to each machine, not attempt is here made to show the proper distance between them. But in any event, they should never be crowded. They may be grouped in twos, and comparatively small space be allowed between each machine of a pair, but ample room should be left between groups for the passing of the largest lumber trucks used about the plant. If electrically driven—which in most instances is preferable—the motors may be arranged several different ways without any material difference in results. The motors should be placed overhead, and directly over the countershaft of each machine, provided individual prives are used. If machines are grouped, not more than two should be hitched to the same motor. Where two or more machines are driven from the same shaft, use loose belts and tighteners instead of loose pulleys and shifters. In this way there is no trouble on the main floor. If it was desirable to have the drive direct connected to any one machine, let it be the timber sizer. The trimming saws behind machines from No. 1 to 5 inclusive may be driven from one motor. The wood conveyor may be driven from the same shafting, or by an individual motor. Drive the trimmer that is opposite the rip saw by an individual motor. If the trimming department for rough stock is to be directly connected with the planing mill, locate the saws at C, D and E, where they may be supplied by the mono-rail car.



Floor Plan for Modern Planing Mill

The indications along the wall and partition lines are for heavy studs or posts carrying the superstructure, and not for the foundation. If the main floor is eight or ten feet above ground or another floor, as is sometimes the case, the motors may be placed beneath. By all means drive the shaving exhaust fans with direct connected motor. It relieves the bearings of the heavy belt strain and saves expense of belting. And while on this point, don't forget that in most instances the shaving exhaust system is overloaded. This condition is the outcome of many causes. One of the chief causes is that the square feet of the openings in all of the collectors or intakes is figured out, and an exhaust purchased that will handle that amount, without making sufficient allowance for friction in the straight runs, and abnormal back pressure caused by the numerous elbows in the system. It is almost invariably the case also that more machines are added from time to time for which no provision was made at the beginning. The usual way for making up the deficiency is by increasing the speed of the face. By doing this, unless you have power to spare, you only multiply your troubles, for the power consumed in proportion to the number of revolutions you increase the speed is about four to one. For example, if the fan is being driven 800 revolutions per minute and consumes 10 h.p., and you increase the speed to 1,600 revolutions per minute, it will require near 40 h.p. to drive it, for the simple reason that the "back pressure" will have increased in about that proportion.

Though the mill may be supplied with lumber in any of the usual ways, the plans contemplate the use of the mono-rail car for this purpose, which is, beyond all doubt, the most economical plan in existence. The car enters the building from either side at a a, or b b, and deposits the load at any machine ready for the feeder without further handling. If trimming saws are located at C, D and E, as shown by dotted lines, they can be supplied by the car dropping the load on a truck to be placed as desired. After the stack is trimmed it may be trucked to any machine, or picked up by the mono-rail car and delivered to machine, stack sheds or yards. The resaw and rip saw are supplied by dropping stack on trucks for them, and as stack often goes to the machines from them, it is readily picked up from trucks and transferred. The mono-rail track should be high enough for loads to pass above the men. If sidings are made, the twin machine, No. 4, is proper machine for the work, putting it through the circular resaw as it comes from the machine. The 6-inch x 24-inch machine is placed next to the resaw for easily transferring stock that is to be resawed after machining—2-inch S2S for resawing into S1S stuff, and double run shiplap, etc. The mono-rail should extend to sorting tables of the sawmill as well as the kilns, as it is often necessary to take stock direct from the saw to the machines. The roll train in front of the sizer should be of sufficient length to easily handle any timbers from the sawmill. It is a good plan to have two shorter tables of rolls for this work, removing one when not running extra long timbers.

If a very heavy timber planer was necessary, it should be either in a separate shed or alongside of the planing room, with enough space to handle timbers without interfering with other work. If a four-side machine is used a long stationary train of rolls should be provided, having a guide rail, and enough live rolls in the train to move the heavy stock. If the sawmill is so arranged that timbers come down the sorting chains, the heavy sizer should be so installed that timbers would be taken off of sorting chains by a transfer and delivered directly to machine.

In case the power must be transmitted from engine to machine through shafting and belting, the main line shaft should run directly over, or directly under, the counter shaft of each machine, using loose belts and tighteners. If there is a full storey beneath the main floor, install the engine there, and belt to the line shaft near the centre. If the main line shaft is below, place the shafting that must be at right angles with it for driving the resaw and trimmers overhead and drive it with a quarter twist belt from the main line. If all the shafting is above, connect the cross lines to the main with mortise bevel gearing. It will be little if any more expensive than putting in mule stands, at the beginning, being cheaper in the long run and far better at all times.

Particular attention should be given to giving each machine proper speed. This is a kind of "brain storm" age; and there is a general tendency to wind things up to the breaking point.

Ayy machines should have a good, live speed, but it is something worth while to know when to stop. And that is just what some otherwise good planing mill men do not know, barring one exception, that being the rip saw. I find them frequently running at 1,500 revolutions per minute, when they should be going 2,500. Planers using the ordinary thick knives should not exceed 4,000 revolutions per minute, and molders the same. In fact, 3,800 is a good speed for smooth work and a minimum amount of trouble and wear and tear. When the hard knife machines came out they were frequently driven at 4,500. We now learn that with the round six-knife head, 3,400 to 3,500 revolutions per minute gives the best results. But with pumping stock through at the rate of 125 to 150 feet per minute on a 3,400 speed of the cutter head, I am not prepared to say what effect it will have on the grades. No bad effect, I hope; for machines running at that speed should go until the "crack-o' doom," without making trouble. And the moral in the fable of the "hare and tortise" race is very applicable in this case. It is the machine with the plodding gait and always at it, that puts figures on the right side of the balance sheet.—The Timberman.

Reducing Staves to Board Measure

There is a pretty strong tendency on the part of stave manufacturers, especially those making tight barrel staves, says a writer in the St. Louis Lumberman, to seek the board measure or 1,000-foot basis in calculating, so as to have handy and convenient all the time a means for comparing the value received for their timber in staves as compared to the current value of oak lumber. Among the recommendations of President Mack Morris (just retired) at the recent meeting of the Tight Barrel Stave Manufacturers' Association at Memphis, was that for future work and development that stave manufacturers compare figures and ascertain how many actual feet of timber it takes to make 1,000 30-inch staves, 1,000 34-inch staves, and 1,000 34 x ⅞, and 1,000 35 x ⅞ staves, and see how from this basis the value received for staves compares with the price paid for logs and the values of oak lumber.

At various times in the past, those with inquiring and comparative dispositions have taken up this subject, and tried by keeping an account of operations as well as by figuring, to arrive at the log measure basis for staves and, of course, different people have obtained varying results. It is comparatively easy to take a stave bolt of given diameter and figure out what it should make board measure, and by diagraming illustrate how many staves it will likely make, but there is always the matter of defects of scrap that must come off of the staves and heart that must come out, and this, together with the fact that different sizes of logs do not work to the same advantage into staves, makes it difficult to arrive at any scientific basis. Some who have given the matter close study, however, believe that it would be possible to establish a fair working basis for reducing stave timber to board measure.

This would probably be a benefit to both stave manufacturers and lumbermen, because it would enable them to more clearly understand their relation to each other, or rather the relation of the products and value, and this, in turn, would be an assistance in guiding one's woods operations toward lumber or staves, whichever offers for the time being the best chances for profit.

There has been established some pretty generally recognized rules along this line, especially in the slack stave business where the run of stock is more uniform. The cord has been reduced to 1,000 feet board measure, and it is pretty generally recognized now that 2½ cords of slack barrel stave bolts are equal to 1,000 feet, and that the average cord will turn out from 1,000 staves to 1,200 staves, consequently, 1,000 feet of timber should be equivalent to 2,500 staves or a little more.

In tight barrel staves there does not seem to have been the same attention given to reducing cords to 1,000 feet, but often it is more readily practical to measure up the logs being worked into staves with some standard scale stick, because they are of saw mill dimensions from 16 inches up generally, and by measuring the logs in the woods when the timber is cut, and keeping a record of them to compare afterward with the output of staves, and also to the quantity in cords, the trade should be able to arrive at a safe working rule for establishing a board measure basis of comparison between staves and lumber for guidance both in timber buying and in stave marketing.

Creating a Flooring Business

It is an open question whether rivalry in the flooring business, and the fact that some people have created their business by specializing in flooring alone, is responsible for the more advanced ideas and exacting requirements in the flooring trade, or whether the most exacting requirements are themselves responsible for the new conditions of specializing in a lot of the flooring product, says C. R. Mason, in "Woodcraft."

No matter which is the right answer to the question, out of all this has developed conditions that give to some jobbing planing-mills an opportunity to create a little special flooring business of their own if they will but pursue the matter in the right way.

The main opportunity for developing trade by the jobbing mill in the consuming territory is in making pine flooring in competition with standard stock from the mill and doing some special order work in hardwood flooring. That it can be done, and is being done to a certain extent, is not a mere theory but a fact or a condition of trade in some localities.

There are some, and particularly those who specialize in hardwood flooring, who will contend that the average jobbing planing-mill in the consuming centre is not qualified to make high grade common flooring in competition with them, and they base their argument on the theory that it requires better dry-kiln facilities than the average planing-mill has, and especialy attention generally to the subject of flooring exclusively.

There is some splendid talking logic in this idea, too, but still the fact remains that an enterprising jobbing planing-mill man in the consuming centres can create quite a flooring business for himself if he is so disposed.

Here is the ground to build it on. Freshness of stock, comparative freedom from kinks and from scars and the battering up incident to shipping and handling, and chance to utilize more or less scrap stock and to refine some low grade lumber into narrow flooring strips of high quality.

Flooring from the average sawmill with a planing-mill attached that is dressed and matched too often has quality sacrificed to quantity of work. Some have the grain torn up, some show bad machining of one kind and some of another, and there are wavy boards and kinked ones due to too rapid drying and to milling too soon after the stock comes from the dry-kiln.

Right here is a point in which the jobbing mill has an advantage over both the regular sawmill equipment and the specialist in flooring. Lumber should not be handled through a flooring machine immediately after it comes from the dry kiln to get the best result. It should be allowed to temper in the open air until the strains set up in drying have been dispersed. Any expert cabinet maker can tell you this, because in cabinet work it is often found imperative to let lumber stand and temper in the air after it has been kiln-dried before joining it up and putting it together for otherwise it is likely to warp, swell, and do many objectionable stunts.

The average man at the producing point and the average specialist in flooring is generally inclined to run his stuff right from the kiln through his machines, whereas the planing mill man, if he has a good dry kiln and does not have to rush his stock through in the regular order, can thoroughly dry his lumber, let it stand and temper in the air for a week, and then work it into flooring just as it is needed. He can also work from stock that has been standing and air-drying for a longer period of time.

The ideal plan should be to take thoroughly dry stock and where practical arrange to keep it piled convenient to the rip-saw and the flooring machine, and not manufacture too much of it in advance. Build your flooring business up on the theory of having freshly milled bright clear stock. You can do this and get enough more for your stock to pay for the work of milling and often it will give you a chance to work up low grade wide stock into high grade flooring and then you can always make a man just exactly any particular width he may want. You can mill some of it ahead and pile it in bins where it will keep presentable, but the better plan is to simply accumulate the raw material ahead. Let it be kiln-dried and then temper in the air and have it ready at hand, so that when a job of millwork comes along you can secure the order for the flooring, too, and let it all be worked out together.

If you are operating a jobbing planing mill in a consuming centre take this idea and study over it and try some experiments with it and the chances are you will find you can create quite a flooring business not only in competition with standard stock in pine and fir, but also in some of the high grade hardwood jobs.

Personal News of Interest to Lumbermen

Mr. Arthur H. Campbell, of the Campbell-MacLaurin Lumber Company, Limited, Montreal, made a business trip of a week's duration to New York recently.

W. H. Magee, of Vernon, a millman of much experience, who has been operating a plant at Lumby, will take over the Ruth & Turner mill at Canoe Creek, Okanagan, B.C., this summer.

Mr. E. J. Maxwell, of E. J. Maxwell & Company, who commenced business in Montreal at the corner of Craig and St. Alexander streets in 1863, has just retired after a long and honorable career. Mr. Maxwell made a specialty of imported hardwoods for veneers, interior house and office furnishings, and all materials for cabinet makers' purposes. Mr. Maxwell's father was a builder and cabinet maker, so that he had the advantage of a thorough knowledge of wood goods of all kinds. In the early days of the lumber business in Montreal, dealers were obliged to get in enough stock during the period of navigation to last the balance of the year. Everything came in by sailing vessels and it sometimes took six months for an order of foreign timber to be delivered.

The business will be continued under the name of E. J. Maxwell, Limited, at 279 St. Antoine street. Mr. W. C. Maxwell, nephew of Mr. E. J. Maxwell, being the secretary-treasurer and manager of the firm.

Mr. Justice Morrison, of Victoria, B.C., has held that where boom sticks are loaned to a company on condition that the company move certain logs by way of consideration for the loan, and the company in moving the logs loses them, that the company is liable for damages to the amount of the loss of logs, boom sticks and chains. The claim was made by the Wattsburg Lumber Company against the W. E. Cooke Lumber Company, both of Proctor, B.C. Defendant asked leave to borrow the plaintiff's boom sticks, and permission was given on condition that the plaintiff moved the logs contained in the boom a distance of 500 feet. In attempting to do so the defendants lost control of the boom and the logs were carried away.

The Diamond Sawmills Company, which includes both Canadian and United States capital, in which F. C. Adams, of Portland, Ore.; C. H. Danaher, of Tacoma, Wash.; Charles Barnum, of Revelstoke, B.C., are interested, proposes to erect a mill with a capacity of 200,000 feet per day capacity at Big Eddy, near Revelstoke. They are negotiating for the purchase of 500 miles of pulpwood and saw timber in the Columbia valley. Work on the sawmill will be started immediately. A 200-ton pulp and paper mill is also to be erected.

Machinery and Equipment

What Manufacturers of Logging, Sawmill and Woodworking Appliances are Doing

The Barnhart Loader—Loading 100,000 feet per day

The Barnhart Loader—can be Operated by two men

The Modern Steam Log Loader

The introduction of machinery in lumbering operations has been one of the most important developments which have taken place in the industry of late years. One of the first improvements in this direction was the use of the steam loader, a splendid example of which is the Barnhart loader, which was developed by one of the largest logging and manufacturing operators in the United States.

The idea was conceived over 25 years ago, and the loader has been on the market many years and is in use in all parts of the country. The developing company for years cut well over 100,000,000 feet a year. Sometimes about 175,000,000 fet. They operated largely in the rough, almost mountainous country of Pennsylvania.

It works on rough, temporary track or on a smooth road bed. Any curve or grade that a train can travel upon serves equally well for the operation of the loader. It completely obviates the building of skids and cleans up a strip over 200 yards wide. To operate the loader requires a crew of three men, one on the loader handling the seven levers and managing devices, one on the ground, and one on the train.

Th managing devices give a very flexible control over all the operations of the loader. One lever swings the crane and power house on its pivotal base. Another takes up and pays out the cable. Another operates the drum that raises the logs. A foot brake holds a log in any position. Another lever unlocks the governors so that the machine may be speeded up when a log is attached. Another lever shifts the loader from one car to anothr, and the last controls the throttle The one operator has all these within reach and can see all around so as to conduct operations advantageously. He does his own firing, the loader consuming about 300 pounds of coal a day.

The man on the ground affixes the tongs to the log, the men on the train steadies the log into position and unfastens the tongs. The operating expenses are three men's wages and the fuel. With this crew the loader will handle 100,000 feet of lumber a day and under favorable circumstances much more.

The total cost of loading logs with the Barnhart loader is about 20 cents a thousand. This covers everything, interest, depreciation and all. By the old method it costs more than that for just building the skids and assembling the logs.

The machine is very strongly built and in sizes suitable for handling different kinds of timber, from the medium sized timber of the south to the giant timbers of the northwest. In cases of a wreck, or a car leaving the track in rough country, the loader can be used as a wrecker, lifting a freight car with ease and depositing it on the track.

The Barnhart steam log loader was first built for and used by F. H. & C. W. Goodyear, the great hemlock manufacturers of Pennsylvania, and for years has been owned and offered for sale by them. The Goodyears own their own timber, operate logging railroads and mills and a main line of railroad which delivers its product together with the traffic of a considerable community to the trunk lines. The logging operations are conducted in a rough country and it was this fact in part which led to the invention and development of the Barnhart steam log loader. It was evident that if these logs could be scattered along the track wherever they would most easily come out of the woods, a great expense would be saved. And then there was the further consideration that a machine which would pick up these logs from anywhere along the track would probably put them on the cars cheaper than they could be loaded from skidways. Such proved to be the case.

The Barnhart Loader—Loading Camp Houses

The Barnhart Loader—Picking Up Sinkers

The introduction of the logging railroad was revolutionary in its effect upon the lumber business. It released the lumber manufacturer from sole dependence on logging streams and therefore made accessible much timber which before was considered entirely out of reach; but the logging railroad itself introduced some other problems, one of the chief of which was how to load the cars. Two methods were adopted. One was to roll the logs up from the ground on to the cars by chain or rope and a team, just as logging sleighs are loaded in the white pine country, and the other was to build elevated skidways along the track from which logs could be rolled by hand on to the cars. The first method was slow and costly from the amount of labor involved, while the second involved the concentrating of the logs at the skids, often so located as to be inconvenient to the swamps.

Taking into consultation the Marion Steam Shovel Company, of Marion, Ohio, the result was the Barnhart, or Goodyear, steam log loader. One of the first problems to solve was how to make this loader portable in respect to the train. Before this machine was invented there had been stationary steam log rollers placed alongside the track and loading on to the cars from big skidways, but this system was not flexible enough to suit the purpose and did not overcome the necessity of concentrating the logs. This was solved by moving the loader proper upon a shallow platform or skids. These skids are supported by sixteen double flanged wheels, each of which sits astride the rail with which the logging car is equipped. There are eight of these wheels on each side. The cars are equipped with rails laid lengthwise across the bunkers or on the platform, if platform cars are used, the rails on two adjoining cars being connected by channel iron made in the form of an inverted "U." Thus the skids with the loader on them can be rolled along the entire length of the train. Starting with the loader on the car next to the end, the empty car is loaded. Then the loader is moved along to the next car and the one it has just left is loaded, and so on until the entire train is filled with logs, leaving the loader on the last car. The loader is changed from one car to another in from one to two minutes.

The loader itself, as will be seen by the illustrations, is mounted on a turntable attached to the movable skids. This turntable allows the cab containing the boiler, engine, drums and the boom to be swung around a complete circle, the weight of the boiler, etc., at one end balancing the weight of the boom and its load at the other, though if there by exceptionally heavy work to be done guy ropes can be thrown out to hold the mechanism firmly in place.

The operation of the Barnhart log loader is simple. Briefly described, it is a power house mounted by a pivotal base on the travelling frame work or skids. From the front of it extends a crane which can be rapidly raised or lowered by power. This power house, which may be entirely closed, contains an upright boiler, two water tanks, coal boxes and a twin hoisting engine with 6½ x 8-inch cylinders, equipped with all the necessary sheaves or drums for winding and unwinding.

It is a matter of experience that by the use of this machine the Goodyear Lumber Company are able to load their logs, transport them to mill and unload them at a cost of not to exceed 20 cents a thousand feet. These figures are from the records of more than ten years during which this machine has been used with unvarying success. In fact, it was in 1884 that the Goodyears began to experiment along this line. They have for the last ten years done all their logging by this method, running four or five loaders, while their use has gradually been extended throughout the country as the advantages to be gained by this system were realized and as loggers became familiar with the advantages of this particular mechanism.

A number have recently been put in in the southern section, while all over the country they can be found operating with entire success. They can be built of weight and strength to suit any class of timber.

The illustrations herewith show the machine in various positions; under varied conditions, indicating that there are absolutely no restrictions upon its use. It works on rough track or smooth, on curves, on grades. As a wrecking appliance it has ample power to pick up an ordinary flat car from the ditch and set it on the track again. This system requires that the cars be fitted with rails. This, of course, is some expense, but to make amends the loader itself is comparatively inexpensive. It is a standard sort of machine whose details were long ago worked out, so that it is not experimental in any sense and can be and is furnished at a price easily within the means of anyone whose operations are of a magnitude to warrant its use.

It is so durably constructed that it outlasts the cars on which it is used. The loader is built utilizing some of the principles of the steam derrick and portable steam shovel, without which most of the great works in civil engineering would be impossible. The manufacturers invite operators to investigate the performances of the loader and to consider the economy which it will effect in their business.

A New Continuous Feed Glue Jointer

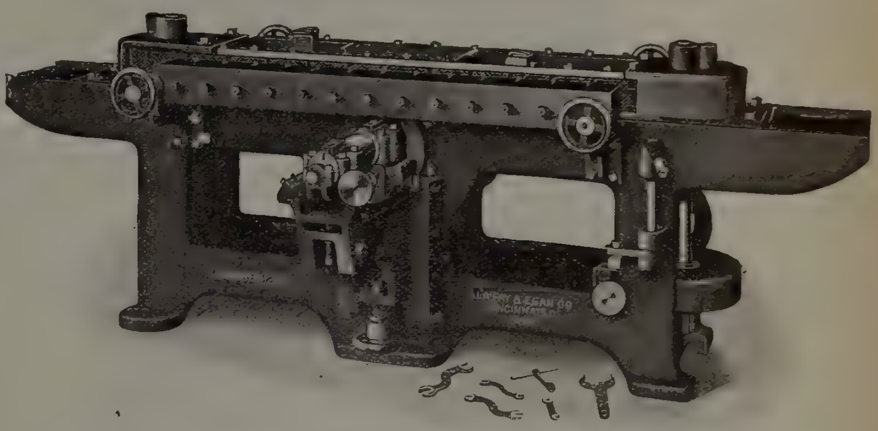
J. A. Fay & Egan Company, at their plant in Cincinnati, Ohio, have recently perfected a Continuous Feed Glue Jointer, the use of which they claim makes it possible to make a glue joint better, faster and more perfectly than has ever been done before on a machine of this style. The machine is especially recommended by the manufacturer for all work where a perfect joint is desired, such as interior building trim, furniture, cabinet, piano and joined woodwork of all kinds. The details of construction of this machine have been so carefully worked out by expert designers that, although the machine turns out the work at the extreme high speeds demanded by manufacturers, it accomplishes the work without the excessive waste of stock characteristic of many high speed machines.

This machine, the company states, has been speedily recognized by manufacturers to be so far in advance of the tool they were using that the J. A. Fay & Egan Company were soon booked with orders for more than they were able to turn out. The demand became so great that arrangements had to be made for building the machine in Canada in order to supply Canadian factories.

First class glue joints are absolutely essential in the manufacture of high grade furniture, panels, cases, etc. Most of this class of work has heretofore been done upon the reciprocating style of machine, because of the heavy cost of installing any of the other systems for doing this work.

The advent of the Continuous Feed Glue Jointer wrought a great change. It is a medium priced machine doing the work quickly and at the same time with extreme accuracy.

A brief description of this machine is presented herewith: It has capacity for material from ¼-inch to 3-inch thick, from 1-inch wide up to any width, and from 6-inch up to any length desired. The frame is absolutely rigid, and is cast open in one piece. All parts are accessible, and all bearings are oiled from the outside.



J. A. Fay & Egan Co's. No. 217 Continuous Feed Glue Jointer

The cutter-heads are located one on either side of the centre of the machinet. They are mounted in heavy housings, having vertical, horizontal and angular adjustments. The housings slide in planed ways with take-up for wear. The angular adjustment to the cutter-head mandrels is a very important feature.

The feed consists of a travelling chain composed of detachable links. The chain runs over two octagon wheels, one at each end of machine, with finished faces and flanged at the lower edge to support the chain. A gib is provided running full length of the chain—not part way only—insuring perfect alignment. The chain ways are adjustable for making spring joints—joints slightly hollowed on long material to insure against opening up at the ends.

The feed is driven by a three-step clutch cone operated by a lever close at hand. The feeding power is transmitted by large bronze worm wheel and steel worm running in oil, absolutely noiseless. Ball bearings are provided for end thrust of worm.

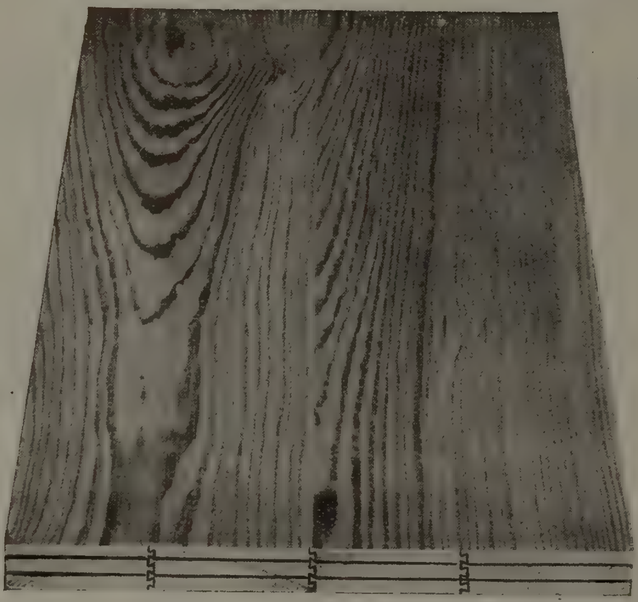
Pressure bars consist of a double series of knurled steel rollers, each mounted in independent housings and backed up by tempered steel springs. Materials varying ½-inch in thickness may be worked without adjustment of the pressure bars.

For further information concerning this machine, readers are invited by the manufacturers to write for their large illustrated circular. The proper address of the manufacturers is 465-485 West Front Street, Cincinnati, Ohio.

A Bay City, Mich., report says considerable pine lumber has been bought in the Georgian Bay and other northern manufacturing districts for shipment to the Saginaw river. Pine will be more firmly held than a year ago. An early opening of lake navigation is expected.

W. I. Margoch, for many years chief forest ranger of the eastern slope of the Rocky Mountains, with jurisdiction over the area south of the Saskatchewan river, and with headquarters in Calgary and Edmonton, has resigned his position with the government. Mr. Margoch will go into the lumber business for himself, and will probably open offices in Edmonton and Calgary. It is understood he has already taken over certain tie contracts on the G.T.P. west of Edmonton. Mr. Margoch's successor has not yet been appointed.

Linderman Auto
Dovetail Glue
Jointer and Mat



Offers the manufacturers of all lumber p
of jointing and uniting their product by o
which means a big saving in labor, lum

**How to make a stronger and t
packing box with less lumber and**

Feed your narrow width low grade lumber into the

Regarding Steel Pulleys

One of the most important developments in the manufacture of transmission equipments was the introduction of the steel pulley. The weight of the cast iron pulley and the great amount of power wasted in using many of the old styles of pulleys led, naturally, to the production of something more economical and effective. The Oneida Steel Pulley Company, of Oneida, N.Y., claim that the pulley question has been solved by the introduction of the steel pulley. The steel pulley, they claim, does not weigh down the shaft with so much superfluous weight and therefore does not require so much extra power, yet has the strength to withstand very heavy duty. Steel pulleys average in weight from about one-quarter to one-third as much as cast iron pulleys. Actual tests, they say, have proven that the steel face has 15 per cent. better belt adhesion than that of the cast iron. Also, the windage of the steel pulley is very slight, since it does not require "broad-side" arms.

Important economies in power transmission are thus secured. This is particularly so in the case of the "Oneida" Steel Pulley, manufactured at Oneida, N.Y., by the Oneida Steel Pulley Company. This pulley has one particular advantage, they claim, over other steel pulleys, since it is made in the greatest range of sizes of any steel pulley in the world, from 6-inch to 126-inch diameter with 2-inch to 40-inch face and 1-inch to 8-inch bore.

Anyone desiring further information concerning these steel pulleys may obtain it by writing to the above-mentioned company.

Dodge Company's Friction Clutch Booklet

We are in receipt of an informative booklet on Friction Clutch Mechanism, from the Dodge Manufacturing Company, Limited, Toronto. Friction clutches during the last few years have materially reduced the percentage of factory accidents attributable to revolving shafting and its equipment, while the friction clutch has unassailable claims from its economical standpoint. By the use of friction clutch pulleys and cut-off couplings it is possible to divide the shafting equipment in a mill or factory into units and to run only that machinery which is actually required. The Dodge Manufacturing Company have had an excellent line of clutches on the market for over 18 years. They have patterns for a complete range in all sizes from the smallest to the largest, and in capacities as small as 1 horse power and as large as 1,000 horse power.

Wickes Brothers' monthly stock lists of machinery bargains are always welcome to the trade. This enterprising firm of machinery manufacturers and dealers, who are located at Saginaw, Mich., carry in stock a most complete and excellent assortment of machinery of all kinds. They also build special machinery of every description and have a fully equipped shop capable of turning out the highest grade of equipment promptly.

The Carlyle Johnson Friction Clutch

Catalogue E of the Carlyle Johnson Machine Company, of Manchester, Conn., U.S.A., which has just been issued, deals interestingly with their well-known line of friction clutches. The serviceability of these clutches is well illustrated by the fact that some of the leading manufacturers have adopted them as parts of their machines, and speak of them in the highest possible terms. On account of their small size they are especially adaptable for use as a part of any machine. Among the advantages claimed by the company for this clutch are the following: It is small, powerful, simple, neat and easily and quietly operated; it has few parts, each being absolutely interchangeable; it runs at high speed without vibration; it can be instantly adjusted to any tension with one screw. The catalogue referred to above is handsomely prepared and contains a large number of splendid illustrations.

Swage in Band Resaw and Log Saw Teeth

Several years ago the State of Georgia sent out a doctor to study the mosquito in the malarial districts, and I happened to be located in a sawmill camp that he chose for his place to make investigations. It was quite a source of interest and amusement to us all to watch the doctor's movements. He was very nice in explaining things to us and letting us look through his magnifying glasses, watch his incubators hatch, and various other contraptions that constituted his mosquito paraphernalia. But the one thing that impressed me greatly and the point that I wish to make is, how he could put such an amount of study on such a small and simple thing as a mosquito.

So is the swage of a saw a small and simple thing; nevertheless, when you give it proper study you find there is quite a lot to learn about it. The principal object of swage is to make a clear path for the blade of the saw to pass through in the cut, so that the blade will not bind and heat. If this were not necessary, the points of teeth could be left in their natural state, and so long as the corners were square the saw would cut with a good deal greater ease, as it would have a much narrower kerf to take out.

It seems to be the general impression that about five gauges heavier swage than the gauge of saw is what should be run. This might do for rough figuring, but, like multiplying the diameter of a circle by 3 to get the cirsumference, it is not an accurate rule. A good many mills have a 14-gauge band log saw and 16-gauge resaw doing exactly the same kind of work. Now, if you put 9-gauge swage on the band and 11-gauge on the resaw, the 14-gauge saw has the most clearance, and I don't know of any reason why it should have. Any one can find proof of this by a little figuring with the measurements of the English standard gauge.

The cutting edge of the swage should be at right angles with the blade of the saw, both lengthwise and widthwise, and balanced on the end of tooth; or, in other words, have as much on one side of tooth as on the other. This, of course, has to do with band saws, as I am aware that some circular saws give good results with what is known as "half swage." There are also conditions that have to be met and overcome, very often by varying from the best rules that can be laid won.

As just stated, the cutting edge should be square with the blades, but it is well to note exceptions. A saw fitted exactly the same from both sides, and lined straight with the carriage track, would be inclined to run out of most woods, and, to overcome this, the cutting edge can be beveled slightly into the log by means of the grinder.

A word of caution here: See that the emery wheel end of the mandrel is straight over your saw, and do your beveling with the other end of mandrel, for if it is done either wholly or partly with the emery wheel end, the tooth will be beveled on top and will vary to a greater extent as tthe emery wheel wears down.

Sharp corners have been preached so much that it is hardly worth while dwelling on that point, though it is an important one, and it may be well to call attention to a special feature of it. A saw may be swaged, and when shaped the shaper doesn't quite bind the metal clear to the points, and after being ground it would be hardly possible to detect it, especially on a small saw; but it will not be near as hard to detect it snaking a little later. The remedy for this is to fit your swage so that it will spread the metal wide enough at the point for the shaper to "feel" it.

As to how many runs a saw should have between swagings, I would say, under ordinary conditions, two or three. Some saws are inclined to crumble, and if they are enough "inclined," about the best thing to do is to incline them out the window, but bad treatment will make some crumble, and good treatment will hold that tendency in check on some really obstreperous ones at times.

It is best to run as small swage as practical, anyway, and if the saw shows signs of crumbling, you had better see if it cannot be still further reduced. Adjust your swage so that it will spread the metal as nearly the right shape as possible, before the shaper goes over it, so that the metal will not have to be crushed to the proper gauge with the shaper. Usually about 1/16-inch is enough face on teeth for first run after swaging, but to check a crumbling saw it will likely help to try a little more than this. If there are any corners crumbled off when the saw is changed after the swaging, if these are not too many in one place, so that it makes an objectionable mark, it is best to cut the opposite corner off with a file and let the tooth await its time to be swaged with the balance of saw, for to pull it out with the swage would be to overwork the metal and only aggravate the trouble.

As to how much bevel or slope the swage should have backward and downward, is a question, but I would not consider it a very important one, for the bevel of any of the shaper does on the market will suffice. It is more important that your bevel is long enough, or, in other words, that there is enough metal behind and below the corners to "back them up" in doing the work they are required to do.

To cut softwoods requires a wider swage, but it need not have so much metal back of it; and to cut hardwoods takes a narrow swage, but stout "rearwards." In regard to hand swages little need be said, as they are generally supplied with instructions for adjusting and operating. Some manufacturers, who are over-anxious to make a sale at times, claim their swage and shaper will straighten the teeth and keep them in shape. That is a very foolish claim, and any one depending on the swage or shaper to straighten bent teeth will be disappointed; at least I have never gotten hold of one that would, and don't expect to.

When the teeth are bent near the ends, the anvil is apt to be causing it, and anvil should be taken out of swage and ground square. But whatever the reason, you will need to straighten them with a hand-set. The set should have narrow jaws, so that it will spring the teeth right at root of swage; one with wide jaws will spring tooth farther down and make something of an "S"-shaped tooth, which condition does not stand for dollars, either, unless it is to lose them. Of course, a tooth sprung at the roots may be straightened with a hammer on the bench, to advantage.

Like a nail, when it is once bent, is very easy to bend again, so is the saw tooth, and to prevent trouble it is best to keep a close watch over the hand swage and remove any cause of sprung teeth as soon as possible, before they get bad.—A. D. P., in the Woodworker.

CAMP DEPARTMENT

Helping the Lumberjack to Fight Booze

By William Henderson, Burks Falls, Ont.

"It is only waste of time and money trying to do any good to the lumberjacks," is what we have been told over and over again by owners, managers and foremen of lumber camps. We have, however, had opinions of our own sufficiently strong to make us persevere and spend both time and money in this so-called useless work for the past five winters. That some good was being done, of course, we have been satisfied, but have never been able to gather up the results in such tangible form that we could demonstrate them to others.

After journeying this winter in our Gospel sleight nearly 800 miles, and visiting 42 camps, we found ourselves suddenly "hung up" with a lame horse in one of the most inaccessible camps north of Webbwood.

While every foreman welcomes an occasional visit from a preacher, there are few, if any, who want to be bothered with one living in camp for two or three weeks at any season of the year, and most assuredly not just in the middle of the sleigh haul. With a lame horse getting steadily worse every day, and needing special attention, of course, the foreman had to put up with this nuisance. This foreman was of an exceptionally good natured disposition, and treated us with the utmost kindness from first to last. Yet, strange to say, of all the camps we had visited this special one showed less disposition to listen to a Gospel service than any other. At Christmas, a number of the boys had gone into Webbwood and blown their stake, and most of them were looking forward to repeating the performance at the break-up of the camp. We were told by one of them that they were reckoned to be the wildest bunch in the Webbwood district, and another told us that no matter what we might say there would only be four or five who would not go on the spree when the camp broke up.

As soon as we realized that our enforced stay might be over two weeks, we decided not to try the patience of the boys by any services except on Sundays, and during the first two weeks just utilized the time in cultivating a friendly acquaintance with the men by a few minutes chat with each as we passed where they were working. At the beginning of the last week of camp, we overheard the foreman complaining that he was very much bothered for want of some extra men, so seeing an opportunity, the writer and his travelling companion, an experienced lumberman, offered their services. While the writer took a paint brush and painted the logs with the trade mark, his companion started in with a sant-hook to "tail down" for the loaders. Until the camp broke up we thus took our regular share in the work, going out with the boys and returning with them again at night. Sitting round the fire, "dinnering out," one had a good chance to get acquainted with the lads, and we were careful not to frighten away their confidences by preaching at them.

One had hoped that the foregoing experiences would have made them more ready to welcome our last Sunday night service, but so strong was the hold of the wilder spirits of the camp, that a dance was started just at the time we went into the sleep camp to hold service. Although there were cries from one man to "keep it going, don't stop," etc., the better feeling of the boys prevailed, and in less than a minute the music stopped and every one was quietly seated waiting for service to begin. Led by the foreman, the boys joined in heartily in singing the hymns, asking for their own favorites, and listened with the utmost attention to an old-fashioned Gospel address, and though the "opening exercises" had been a dance, it was one of the best meetings the writer has had.

On Monday the writer heard incidentally that the boys were feeling very sore about the situation the ringleader of the dance had placed them in, and thus his influence over them was broken. The question now simply resolved itself into, who was to lead "the gang" when the camp broke up, so we decided to try an experiment, and on that day and Tuesday (the camp broke up on Wednesday), quietly suggested to the boys we were working with that all who had made up their mind to cut out the booze should form a gang of their own, and have a farewell dinner at the restaurant in Webbwood, with the writer. By Tuesday night we had a list of twenty out of the thirty-three men in the camp, who decided to be "on the water waggon" this time; and having a chance to drive into Webbwood with the walking boss on Wednesday, we ordered dinner for this number at the restaurant.

As the boys, after their long thirty-mile tramp, were likely to be thirsty, and tired, the writer was fortunate enough to secure the co-operation of the Methodist minister, the Rev. Mr. Wallace, and his wife, and when they came into the village had lots of lemonade and oranges waiting for them in the parsonage, and likewise water, soap and towels for them to wash. When they found themselves in such comfortable quarters, the boys showed no hurry to leave, and only allowed themselves time to cash their cheques and then go to the restaurant for dinner.

After dinner we had the satisfaction of seeing the bulk of the men off by the afternoon train without even a drunken man on the platform, and the majority not having touched a drop of liquor. Of course, there were a few out of the camp who went their own way and had a horn or two, but it was a curious thing that these were the men who thanked the writer for his good advice, and insisted on his accepting a quarter or fifty cents towards his expenses.

We had to shoot our horse before we left camp, but the satisfaction of sending so many young fellows home sober more than compensated for the loss, and we feel sure some, at least, who read this will aid us in meeting this loss and assist us to continue the work.

In conclusion, it is a curious fact that independent testimony has reached us that at Whitefish, Nairn and Webbwood, the different points we visited in our missionary journey, there has been a very noticeable difference in the drinking habits of the men. At Webbwood the day we were there one gentleman from Massey remarked that the conditions were most strikingly different in the two places only ten miles apart, there being about thirty drunken men in all stages hanging around the station at Massey, while in Webbwood there was not one. No missionary work had been done by us at Massey.

Surely the above facts should indicate that it is worth while to do missionary work in the camps. Any one desiring further information should write Thos. Yellowlees, secretary of the Shantymen's Christian Association, 23 Division street, Toronto.

A Good Winter's work in Saskatchewan

Lumber operators at Strathcona, Alta., report the winter just closing to have been one of the best in years for logging work up the Saskatchewan river. Several hundred men have been engaged in the numerous camps up stream for the last three months, and under the favorable conditions have probably made a record cut of timber for Twin City millmen. Mr. John Walter's contractors employed over 400 men in the woods this winter. They took out something over twelve million feet of logs. In addition to this cut, Mr. Walter has between five and six million feet of logs left from last season on the banks of Poplar creek, about sixty miles up. If all this timber can be landed safely in the booms at Strathcona, the two mills are assured of one of the heaviest runs in sawing they ever made. Mr. Walter reports that he will probably improve his new mill on the Edmonton side of the river, with a view to increasing its capacity to 100,000 feet of lumber daily, which, with the big mill on the Strathcona side, will make possible a total daily output of nearly 160,000 feet. Even at this rate, the capacity of the mills will be taxed to handle all the logs available this season.

It is reported that all the contractors have cut more logs than their agreement called for, as a result of the favorable conditions during nearly the whole season. The early part of the winter was mild enough to permit very rapid progress being made at the cutting and in the colder weather of January the increased depth of snow gave an excellent opportunity for doing a great deal of hauling. The bulk of the timber is now on rollways along Poplar creek and the river, ready to be sent down when required during the coming summer.

The Hon. Mr. Taschereau recently assured a large delegation from Beauce county, Quebec, that changes in the law would be made whereby proprietors who improve watercourses passing through their territory should be privileged to tax the logs which are floated down the stream. In many instances owners have done much work in blasting, dredging, damming and otherwise improving the channels of the rivers, yet receive nothing for the use of their river by lumber dealers. The chief rivers in question are the tributaries of the Chaudiere.

The camps of the Louise Lumber Company in the township of Louise at the head of Lake Megantic, Que., broke up during the second week in March after an extra good winter's work. The quantity of the lumber got out is between seven and eight million feet, which has been landed on the Upper Spider river, Lake Maccannamac, Rush lake and the Arnold river.

At the recent annual meeting of the St. John's Ambulance Association at Vancouver, B.C., it was decided to extend the work of the association by forming classes in the neighboring mining and logging camps.

WANTED & FOR SALE DEPARTMENT

PUBLISHERS' NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line ($2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same adverticement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Employment Wanted" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies.

Advertisements of "Employees Wanted" will be inserted at the rate of two cents a word net. Cash must accompany the order.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

WANTED—LUMBER, ETC.

Have you any stock which you wish to sell? If so, make the fact known to probable buyers by placing an advertisement in the Wanted and For Sale Department. Address Canada Lumberman, Toronto.

Basswood Lumber Wanted

Wanted about 100,000 feet Dry White, 1-in. and 1¼-in. Quote lowest cash price for log run, 1's, 2's, Common No. 1 and 2. Box 212 Canada Lumberman, Toronto, Ont. tf.

TENDERS FOR PULPWOOD LIMITS.

Tenders will be received by the undersigned up to and including the 10th day of April next, for the right to cut pulpwood on certain areas situate:

(1) On the Abitibi Lakes and River tributary to the Grand Trunk Pacific Railway, and Northern Ontario Railway, in the District of Nipissing.

(2) On Rainy Lake and around the shores of Lower Manitou Lake, tributary to Fort Frances on Rainy River, in the Districts of Rainy River and Kenora.

Tenderers shall state the amount they are prepared to pay as a bonus in addition to dues of 40 cents a cord for spruce, and 20 cents a cord for other pulpwoods, or such other rates as may from time to time be fixed by the Lieutenant-Governor-in-Council, for the right to operate a pulp and paper industry on or near the areas referred to. Such tenderers wil be required to erect mills on or near the territories and to manufacture the wood into pulp and paper in the Province of Ontario.

Parties making tenders will be required to deposit with their tender a marked cheque, payable to the Treasurer of the Province of Ontario, for ten per cent. of the amount of their tender, to be forfeited in the event of their not entering into agreement to carry out conditions, etc.

The highest or any tender not necessarily aucepted.

For particulars as to description of territory, capital to be invested, etc., apply to the undersigned.

F. COCHRANE,
Minister of Lands, Forests and Mines.
Toronto, Ont., Jan. 10, 1911. 3-7

Eastern Manufacturers Buy Timber Limits in B.C.

Why will you pay extravagant prices for timber when choice timber can be bought here from 50 cents to $1.00 per M.? I can supply you from 20 million to one hundred and fifty million. Write quickly to W. Mark De Cew, Paulson, B.C. 7-7

Mill and Timber for Sale

1,100 acres, well timbered with birch, hemlock, pine, basswood, spruce and cedar, together with new lumber and shingle mill, steam feed, large frame boarding house close to mill, situated on railway siding. Must be sold to close a partnership. Excellent opportunity for small mill man whose supply of timber is cut out and is looking for a new location. Stock of certain length now in yard. Get busy, this is a snap for some one. For further information apply to Box 531, Orillia, Ont. 6-9

Right Way to Put on Spliced Leather Belts.

The general opinion has always been that the correct way to put spliced belts on the pulley was to place them so that the splice or joint would run on the pulley side and against the splice on the outside of the belt. The inside can take care of itself, as the joint is kept smooth by the contact and pressure of the pulleys (especially is this the case where any belt dressing is used). It is always the outside of a splice that opens up and causes trouble. In running over he putlleys he tendency is to open the splice on the outside and close it on the inside. After the thin edge once starts to open the air is forced under it (as it runs thin edge first on the outside) and it soon becomes detached. Instead splice belts should be run with the splice on the pulley side so as to offer no resistance to the air on the outside of the belt.

Circular Saw Hints.

A saw just large enough to cut through a board will require less power than a larger saw, the number of teeth, speed and thickness being equal in each. The more teeth the more power, provided the thickness, speed and feed are equal. There is a limit, however, or a point where a few teeth will not answer the place of a larger number. The thinner the saw the more teeth will be required to carry an equal amount of feed to each revolution of the saw, but always at the expense of power. In circular sawing the timber is often inclined to rise up at the back of the saw when pushed hard. The reason is that the back half of the saw, having an upward motion, has a tendency to lift and raise the piece being sawn, especially when it crowds between the saw and the fence, whilst the cut at the front of the saw has the opposite tendency of holding that part of the piece down. The hook or pitch of the saw teeth should be on a line from one-quarter to one-fifth for soft wood.

Good Leather Belt Dressing.

A good dressing for a deather belt is made as follows: Prpare tallow by boiling in water, so that the latter may take up the salt and dirt, which may be poured away when cold. Remelt the clean tallow, and when it is warm pour in cod oil in the proportion of 1 gallon to each 2 pounds of tallow, stirring until the mixture is cold. The oil must not be boiled, as that destroys its valuable qualities. Apply this dressing with a flat brush to both sides of the belt. A belt treated with this dressing will run slacker and "suck" the pulley better and transmit more power than a dry belt. A hard and dry belt may be restored to proper condition by a few applications of neatsfoot oil. Sometimes rosin is added, but its use is not recommended, as it gums the belt, causes it to crack, and prevents slipping for only a short time. If a belt which is properly cared for persists in slipping, a wider belt or larger pulleys should be used. Leather belting should be moistened occasionally with enough castor oil to keep it pliable and in condition.

The Forests of Labrador

Dr. Wilfred T. Grenfel read a paper on "Labrador" before the Royal Geographical Society recently. Referring to the timber prospects, he said that the immediate future of Labrador would depend largely on the possibilities of its timber for pulpwood. It was safe to say that, while there were areas in Labrador which under present circumstances could not be successfully worked for pulp, there were others that most certainly could. The policy of the Newfoundland Government in refusing to export the raw material appealed to him as a very wise one, for with pulpwood standing at $12 a cord, and almost unattainable even then in Wisconsin, he had every confidence that there were areas in Labrador that carried enough available timber to be worked successfully. The expense of milling was beyond his province, but Labrador possessed an almost inexhaustible water power, which in the future would undoubtedly be one of her chief economic assets. He sounded a warning to those thinking of investing in pulp speculations in Labrador. According to Mr. A. P. Low, while as far north as lat. 54 deg. the forests might be said to be practically continuous except on the highest hilltops, by lat. 55 deg. half the country was treeless, while those that did exist had greatly decreased in size.

Review of Current Trade Conditions

Ontario.

The cold weather of late has had the effect of delaying the opening up of the spring demand for lumber. Travellers report that retailers as a rule have fairly plentiful stocks, and are not showing much inclination to buy for future needs. The demand from Tonawanda and other points on the United States border has not yet wakened up. Generally, by this time of year, there is a fair trade in progress with northern United States points. It is supposed that the political uncertainty is inducing purchasers across the line to hold back in the expectation that the introduction of reciprocity will enable them to share in the reduction of duty. This is rather a vain hope to bank upon at this stage of the proceedings. It will be a matter of some months yet, in all probability, before the reciprocity measure can possibly become law, and there is so much to be accomplished before that time at Washington and Ottawa that the summer will be well advanced before there can be any question of a removal of duties. Stocks of lumber, for the spring and early summer demand at least, will have to be purchased before any change in the duty can occur.

Stocks of dry lumber at mill points are gradually becoming smaller and the mills will find themselves with plenty of piling space for the new stocks when the sawing season opens. Wholesalers report that there is a fair amount of business in progress in Ontario, but that there is a disposition on the part of the mills to hold back their stocks in the hope of obtaining better prices a little later on. In view of the fact, however, that business on the other side of the line is duller than in Ontario, it does not seem probable that an advance in prices is likely to occur. Some of the larger wholesalers, in fact, report that there is a slightly easier tendency at present in all grades of white pine. The volume of trade, however, is equal to that of a year ago, if not a little greater. A few contracts are reported for white pine and hemlock at about the same prices as a year ago. The same applies also to pine and hemlock lath.

Shingle prices are fairly well maintained. The manufacturers of the west coast have apparently got into a much stronger position than they were in some months ago, and there is practically no price cutting in progress. This is a matter of considerable satisfaction to the wholesalers in Ontario, as it enables them to conduct their business on a much more certain footing. They are all in hope that the prices of shingles will continue stable.

Speaking of hemlock, a Toronto wholesaler who conducts a fairly extensive business in this wood, states that he recently visited the northern section of Ontario to buy a small stock. He found it practically impossible to pick up anything at all. The small mills, he states, seem to be practically cleaned up of all kinds of softwoods. Only a few of the large mills, which can afford to hold their stocks for higher prices, have any dry stocks on hand.

Hardwood stocks are almost entirely cleaned up. Dry stock is reported to be right off the market. Soft maple, birch, basswood, elm and ash can only be picked up by chance in odd places. Any one who has stocks of these woods can get his own prices for immediate shipment. This situation should have a tendency to make the future of hardwods firm. Of course, as soon as the new stock comes on the market, the high prices which are now asked will have to be reduced. Under present conditions, consumers are obliged to look to new stock for all their requirements.

Eastern Canada.

The lumber trade at Montreal shows good indications of activity. Although the disagreeable weather during March held the trade back to some extent, the outlook is for an excellent summer trade. The opening of trade will be greatly stimulated by the summer freight rates between Ottawa and Montreal, which went into effect on April 1st, and by the summer rates from Albany to New York, which went into effect on March 20th. There is a strong feeling in the market for lath. The business in ground wood pulp continues very active at good prices. There is a strong demand also for chemical wood pulp.

The lumber trade at Boston is not very brisk, although there is a notably stronger tendency to good pine and a little more inquiry for cheap box board qualities. White pine uppers, 1 to 2-inch, are quoted at $98 to $100, and selects at $86 to 88. Spruce lath show a tendency to stiffen and white cedar shingles are scarce and somewhat stronger. A slight improvement is apparent in the Boston market for spruce. Dealers are evidently expecting an increased demand in the near future. Frames are rather quiet. Manufacturers are holding stocks rather firmly, and asking as high as $23. Random is a little firmer, though in moderate demand. A small amount of new business only is reported in hemlock at Boston. Manufacturers, however, show no tendency to part with stocks. Business in general is at about $19 for eastern clipped boards. Some dealers, however, expect shortly to secure $19.50. Shingles are firmer at Boston, and some dealers are looking for an advance of at least 25 cents. The best cedar extras are offered at $3.25 to $3.40. Lath are rather uncertain, ranging at $3.65 to $3.75 asked for 1⅝-inch, and $3.35 to $3.40 for 1½-inch. At New York the demand for eastern spruce is moderate. Hemlock buyers are coming into the market slowly.

Great Britain.

There is a decidedly buoyant feeling about the timber trade throughout Great Britain and the demand for Canadian wood goods is improving steadily. This is not, perhaps, so marked at London as at other points, but even there, the stocks put up at recent auction sales have been easily disposed of. Arrivals of spruce deals are keenly anticipated and the stocks are invariably disposed of before arrival, at firm prices which show a tendency to advance. The building trade in Lancashire is quite active and a good demand is also in evidence on the part of the railways, which are consuming large quantities of oak. The most important feature of the lumber trade to-day is the demand for lumber for Coronation purposes.

Quebec spruce is quite firm, having sold recently at £9.15s. and £10 for 3 x 11. Quebec pine, 3 x 11, 3rd quality, has sold at £15.5s., and 3 x 9 at £12.10s. London holders of birch are showing no disposition to part with their stocks unless they can secure tempting prices. There is a good demand and stocks are scarce.

Spruce deals at Liverpool are selling at £8.5s. There is a good demand and business is improving steadily. The same may be said of Canadian pine, although it is reported that business is somewhat hampered by the high prices required. First quality Quebec pine is quoted at £25.10s. to £40 per ton. There is a better demand for spruce boards at Liverpool and quotations are from £7.5s. to £7.10s. per standard. The demand for birch logs is strong at Liverpool, and stocks arriving are quickly taken ex quay. The same is true also of planks, which are quoted at 9d. to 11d. per cubic foot. Quebec birch is bringing 1s.6d. to 2s. 4d. per cubic foot, and St. John birch brings from 1s.6d. to 2s.

An improvement in trade is also noted at Manchester, where spruce stocks are now scarce. Sales of floorings have been numerous, at prices ranging from £10 to £10.5s. per standard. Birch logs and planks are practically exhausted at Manchester. Disagreeable weather has interfered with trade to some extent at Bristol and Cardiff, but a healthy demand is now reported from both places. Glasgow also has felt the general improvement in trade, and stocks are considerably reduced. There have been good sales of pine deals and general pine lumber. Quartered oak has been selling at good prices and birch is in good demand. The shipbuilding trade is quite active and causes an extensive consumption of lumber.

United States.

A general condition of uncertainty prevails at most of the large lumber markets of the United States. Reports received from different points are very contradictory. There is in the aggregate, however, a fair quantity of business in progress, though the volume for March is not up to the average. There is no apparent rush of orders from interior retail yards, buyers being, as a rule, very caution about the placing of their trade. The nature of trade sems to be more of a sorting up character than stocking up. Spring trade in the Eastern States has scarcely even opened up. The building demand is still rather quiet, and manufacturers are very cautious about their purchases. The only active part of the trade in general seems to be that of exporting. The railroads apparently have not yet come into the market.

In spite of all these features, however, there is a steady increase of the volume of trade at most retail yards, the indication being that trade is only a little bit slow in opening up. Reports from Chicago are to the effect that northern pine is steadier and stocks are bare. This applies to low grade lumber, as well as the better qualities. During the past month the demand for hardwood has improved at Chicago. Birch and maple are the leaders among the northern hardwoods. Quartered white oak is rather quiet, and supplies at Chicago are plentiful. Other hardwoods are about steady. The trade in hemlock is improving gradually at Chicago and prices also are advancing slowly. The demand now is as heavy as it was before the recent advance in price.

A fair inquiry is reported for southern pine at Chicago, but there is no improvement in demand to note. The market for red cedar shingles is rather dull. Clears are at about $3.17 and stars at $2.69. Some sales, however, are reported at $3.12 and $2.64 respectively. Improvement is noted in the market for white cedar shingles. Extras are scarce. Prices are ranging from $2.95 to $3.05. Standards and No. 1 are plentiful, selling at $2.15 and $1.15 respectively.

At Buffalo, a slight increase is noted in the white pine trade, on

E. C. BARRE, Assistant Manager

account of a gradual improvement in the building line. Good grades are rather scarce and strong, while other grades are firm. A slight improvement is also noted in box lumber, though no great increase in price is expected. Hardwoods at Buffalo are a little stronger. Maple is selling readily. Beech is strong and sells almost as readily as birch. There is a good market for plain and quartered oak, and prices are firm. The demand for hemlock at Buffalo is improving with the opening up of the building trade and prices show a stronger tendency. Better orders are also reported for North Carolina pine at Buffalo as a result of plentiful enquiries and orders. The demand for shingles is stronger, and jobbers are now quoting lake-an-rail rates. Prices this summer are expected to be about the same as last, on a basis of about $2.10 for red cedar clears.

Market Correspondence

A Late Driving Season on The Ottawa

Ottawa, March 25.—The driving season on the Ottawa river and its tributaries will be much later than usual this year. The lumbermen usually calculate on a general break up about March 15, in the upper waters. However, this date this year found everything frozen up solid, and the roads still in good shape. The lumbermen look upon conditions as good, nevertheless. When the break-up comes too early there is always a cold spell afterwards, and a lot of water is lost, making it difficult to float out all the logs. Generally speaking, operations in the woods closed as usual on March 15, and the time since then was occupied by the comparatively few men who are employed all year, cutting trees near the shores of the river. The majority of the shantymen have reached the city, homeward bound. They all seemed to be pretty well satisfied with conditions in the camps during the winter.

Each spring, when the men return from the camps with their pockets full of money, there is a tendency to "cut loose" on reaching the city, and too often the men fall a prey to pickpockets and the like. There were one or two instances again this year, but on the whole the men are becoming more careful and have more of a tendency to save.

The rates of pay for the driving season have not been fixed yet. However, a considerable number of men have gone to the woods again to work until the drive begins, at from $26 to $30 a month.

The small mill owners scattered over the Quebec side have cut more extensively this year than usual. This is to a great extent due to the willingness on the part of the dealers to contract ahead for their output, which is, for the most part, birch. These contracts were signed around $17 at the mill (mill culls out).

Dealers find the prices stiffer throughout. A number of contracts in hemlock and spruce were signed up during the past two weeks. These were for the log run (mill culls out), and the prices ranged from 50 cents to $1 per thousand more than last year at this time.

A fire at the lumber mills of Shearer, Brown & Wills at Buckingham, Que., took place on March 17th, and destroyed about 200,000 feet of lumber, valued at $15 per thousand feet. The origin of the fire is unknown.

Twenty-seven heavy draught horses were sold by auction here the other day. They belonged to the estate of the late Joseph Groulx, who formerly had a contract for removing wood from W. C. Edwards Company's mills. The average price paid was from $400 to $425 a team.

Work was begun this week on the planing mill which is to be erected at Westboro by Cummings Brothers, of River Desert. This will be a branch mill to the one at River Desert, to supply that rapidly growing section of the city.

The planing mill of James E. Wilson, in Ottawa South, is completed with the exception of installing one more machine. It is operated by electricity and has a 35 h.p. boiler for drying purposes. Mr. Wilson has 37 machines installed. The kilns are of concrete, and the mill of concrete and iron clad.

There is very little, if any, change in dressed lumber prices. The mill men all anticipate heavy building operations and the orders so far are above the average.

The money invested in the lumber business in the city alone, not including operations in the woods, is illustrated by an estimate of a prominent insurance man the other day. After careful calculation he fixed the amount of insurance carried on lumber mills and lumber in the city and suburbs at $6,200,000. The rates paid range from $1.75 to $2.50 for one year.

There is a steady increase in the number of industries locating in Ottawa, using by-products of the saw mills. The vast amount of these materials available, resulted in a number of firms opening up business here last year, and the indications are that there will be an even greater number this year.

The mill owners are still having difficulty over the low water in the Ottawa river, but it has begun to rise a little now. The officials of the Upper Ottawa Conservation Commission state that conditions would have been much more serious but for the control of the supply, which the work of this body had made possible. Next year there will be much more control and very soon it is claimed the scarcity of water power at the lowest seasons will be a thing of the past.

Montreal Trade Outlook Promising

Montreal, March 22.—Lumbermen report that the severe weather during the month of March has kept things in a backward state, but on the whole the outlook for the summer trade appears to be as good as they ever knew. No accurate forecast can yet be given as to when the rivers will break up and rafting begin, but there is fair prospect that this will occur about Easter. Efforts are being made, weather permitting, to have the canals opened up by April 20th, but this is only speculative.

Summer freight rates go into effect on April 1, which means a difference of 5 cents per hundred pounds from Ottawa to Montreal. Summer rates on the Williams Line from New York to Albany went into effect on March 20th. The all-rail tariff from Ottawa to New York is 16c. per hundredweight, whereas lumber shipped from Ottawa to Albany by rail, and from Albany to New York by water, will be only 13c.

The ground wood pulp business has been particularly busy during the past winter and high prices have prevailed. Low water in the eastern and western States caused low production there, and Canadian mills have shipped every pound manufactured. The same conditions prevailed in the Quebec region during the past two months so that the full product was not turned out. In newspaper, Canadian mills have had a good season, though United States prices have been cut materially on account of the threatened removal of duty.

Chemical wood pulp is in good demand in Canada and prices are very much firmer than they were last fall. The position of chemical pulp in the United States is improved as the European importers are looking for higher prices for their product.

Official Measurer Needed.

At a recent meeting of the lumber merchants of this city complaint was made that dishonest measurements had been given in connection with certain transactions between dealers and contractors. A specific charge was made in a certain case in which a contractor was building two blocks of houses, exactly alike in plans and specifications. Quotations were asked of two dealers in the first instance, and the lowest offer was accepted. When the time came to build the second block both dealers were again approached, but, as the highest priced lumber was the better seasoned, it was taken. When the block was completed the contractor found that although every detail in the second contract was a duplicate of the first, he had considerable material over. The only logical conclusion he could come to was that the first dealer had cheated him by giving short measure.

Then the question arose as to official measurement, and the discovery was made that there is no official measurer for lumber, or anything of the kind in this city. The official weigher is called in when there is doubt as to the weight of a load of coal or a dozen bags of potatoes, but there is no one to appeal to if there is a discrepancy between the measurement charged up by the wholesaler against the retailer, or the retailer against the contractor, and the qualities found by the purchaser after delivery. Several such instances were vouched for and the statement of the facts not only created a painful impression but aroused a serious purpose in the minds of the members to take the necessary steps to have official measurers appointed at an early date.

Improving Trade Ethics.

Following up the organization recently of the Retail Lumber Association in Montreal, a movement is on foot to define more clearly the limits of the operations of the four departments of the lumber business. This matter was earnestly discussed at the last meeting of the Montreal Lumber Association, and the expectation is that all the matters involved will shortly be satisfactorily arranged. The complaint is made that some manufacturers pass by the wholesaler and even the retailer, and dispose of quite small orders to the consumer. An educational campaign has been inaugurated for the purpose of putting short-sighted dealers on the right track. Already, it is said, several manufacturers have been convinced of the error of their ways and agreed to do business only in their proper sphere, while the wholesalers have been brought to see that if they get protection from the inroads of the manufacturers they must guarantee the same fair play to the retailers. The contractors will be quite as well off under the new conditions. A strong argument that has been put forth is the fact that the manufacturer, by combining wholesale and retail business with his legitimate trade, does not really increase his business, but he merely cuts out the middlemen with no actual advantage to the contractor or consumer. That this will be all made right during the present season is the confident opinion of those who may be regarded as well informed on the situation.

Consumption of Flooring and Doors in England

Liverpool, March 18.—Of the manufactured wood goods which reach the United Kingdom, prepared flooring boards hold the first place and. as regards acceptance in the British market, hold a favored position in comparison with all other kinds of manufactured wood goods. One hears complaints of the importation of such goods as framed doors, roll top desks, and cabinets of the newer commercial labor-saving class, but one hears no complaints of the importation of planed and tongued and grooved flooring boards. Let the building trade be as quiet as it may, a large consumption of prepared flooring boards will be in progress, taking the country as a whole. A very fair demand for these boards exists at the present time, and they are selling at £10 to £10.10s. per standard, for 1st and 2nd quality, and £9.10s. to £9.15s. for 3rd quality. The boards form a valuable and acceptable class of goods and a large consumption of them seems assured.

Framed doors of Canadian make have bulked more largely in the public eye, within the last few years, than the receipts and use of these goods have warranted, owing to the outcry which has been raised about the importation of such doors. The complaint has been that every door imported and sold, has deprived some joiner in the United Kingdom of work and wages which ought to have been his. Imported doors have not, consequently, found the open market in the United Kingdom which might have been expected, in spite of the fact that they have been offered at prices which have seemed ruinously low. At th present time four-panel doors, 6 feet 4 inches x 3 feet 4 inches, and framed of 1¼-inch stuff, can be bought freely at 3s and 3s. 6d. each, and will be sent by rail, carriage paid, over a great part of the United Kingdom, for 3d. extra each. The doors are well made and moulded, and appear to be as good as could be desired, as inside doors for houses of the smaller cottage class; that is, the class tenanted by weekly-wage earners. The use of imported doors of the kind may be said to be confined to cottage houses, and only to inner doorways of such houses. Outer doors for back and front are of a different kind. Front doors are usually designed for each lot of new houses, and are much stronger than the doors for use between inner rooms. The stiles and rails of front doors are usually of 2-inch wood, and the panels are frequently ⅞-inch thick, as finished, and are moulded to show as "solid" panels. If the panels are sunk, a deep and fairly massive moulding, 2½inches, 3 inches or more, in width, is used, to give an aspect of strength and massiveness. Front doors of houses of the better class are usually "double," that, is made in two parts or "leaves," one part, or leaf, being hinged to each side of the doorway and the two parts closing to meet in the centre of the door space. Yellow pine of good quality is used for front doors of small to medium size, and yellow, red or pitch pine for the heavier doors of houses of the larger class. Some importance is attached to the design of doors for houses of this class, so that it is desirable that they should be made by a builder's own staff or by the contractor for the joinery. Doors of a much plainer class, some framed and having four panels, others made of tongued and grooved spruce, are used as "back doors." These last are simply "nailed" doors, and are made by nailing the lengths of board to three strong cross-bands, of 1-inch or 1⅛-inch spruce or yellow pine, 9 inches or 11 inches wide. The visible edges and ends of the cross-bands are bevelled with the plane, to give an air of finish. These doors are inexpensive, and as "back doors" are largely used, being used almost invariably for cottage houses and for many houses of a larger size.

While the wood for all of these doors must be imported, it would not be profitable to attempt to supply doors ready made for houses of the better class owing to the differences in size, strength and design. As inner doors for cottage houses, a moderate demand exists for the cheap framed doors which are imported. Of late, competition has arisen in this branch of the trade. Canada used to be looked to as the maker and provider of goods of the kind, but Norway has stepped in and is now competing with Canada for the business. She, too, is sending ready made doors to the English market. The demand for the goods can not, however, be spoken of as being large or active. It is a quietly steady demand, and such it promises to continue.

Revised Wood Goods Schedule at Manchester

Manchester, Eng., March 18.—On March 1 a revised "Wood Goods Schedule" was issued by the Manchester Ship Canal Company, which is of importance to shippers of timber to Manchester, and to merchants who reside there. The schedule is a formidable compilation of 22 folio pages, and gives the canal tolls, quay and storage charges, charges for lighterage to wharves and waterside premises in the Manchester district; the scale of computation of weights of pit props and mining timber, and a vast mass of information bearing on the receipt, storage, classification, methods of measuring, and the loading and conveyance of timber of practically all kinds, which come within the jurisdiction of the Manchester Ship Canal Company. Several alterations in the schedule lately in use have been made, some relating to the method of charging and others to procedure when lodging orders for storage. Other alterations are in the through railway rates. Reductions have been made in several of the through rates which appeared in the old schedule, through rates to 87 additional places have been added to the list. The bases of the charges per ton, as canal tolls, for the uses of the ship canal between Eastham (the sea entrance to the canal) and Runcom, and Latchford (ports on the canal) and Manchester; are as follows: Timber in the log or in planks in an unmanufactured or roughly hewn or sawn state is charged at 40 to 50 cubic feet to the ton, as defined in the general railway classification. Deals, battens, and boards unprepared, not exceeding 4 inches in thickness, of fir, American whitewood, yellow poplar and and boards, are charged at 66 cubic feet to the ton. Carolina, Pensacola or other pitch pine deals and boards, unprepared, not exceeding 4 inches in thickness, are charged at 55 cubic feet to the ton. Hemlock and larch deals are charged at 50 cubic feet to the ton. All boards prepared or unprepared other than those specified, are charged at 40 or 50 feet to the ton according to their description in the general railway classification. Laths (plaster) in bundles, are charged at machine weight per ton. Lathwood(not laths) and pulpwood are charged at 2 tons 4 cwt. to the fathom of 21* cubic feet per ton. The tonnage and fathom basis in this case is one of the additions which appear in the new schedule. Riga blocks, 9 feet long by 9 inches or 10 inches square, or 10 inches by 5 inches, not creosoted, are charged at per standard of 2 tons 10 cwts. The schedule of quay and storage charges on timber imported to the Manchester docks, is very fully detailed, practically every kind of hard and soft wood in use in the United Kingdom being specified, or covered by a general term. The new schedule shows how large an importance the timber trade now possesses in the eyes of the managers of the Ship Canal Company, and how confidently they look for an increase in the import timber trade at Manchester.

Improved Trade in Great Britain

Liverpool, Eng., March 18.—Business in Canadian wood continues to improve and a more cheerful tone prevails among importers and merchants at the ports of arrival. London has been slow to move in the softwood branch, but there is no denying that business has improved. At the recent public sales, the stocks offered have sold readily, the better qualities of lumber being well competed for. Consignments of spruce deals to arrive have been watched for with a degree of interest which has augured well for the trade, and have been competed for and taken over before coming to hand. Prices, generally, are firm, and show signs of hardening. The demand from the building trade in the London district keeps quiet, but in other parts ohtre parts of the country, notably inetaoinshrdletaoinshrdlucmfwyp of the country, notably in Lancashire, there has been an improvement. Some of the railway companies have been buying to replenish stocks, and a good deal of timber, chiefly oak, has heen taken by them. This has given an air of new life to the trade. At the moment, interest in London centres on the demand for lumber which the Coronation will make, for stands, barricades and other erections. A very large quantity of planks, blocks, scantling, battens and boards of every quality will be taken for Coronation uses, as every possible vantage point which can be secured for the erection of a stand will be so utilized. In many cases the stands will be extensive, and will have substantial under structures. In framing these structures, planks, scantling and even log-stuff will be used without stint, any wood having a semblance to soundness being taken readily for the work. Special consignments of wood are said to be coming from Aiga, with a view to their being taken for this particular work. The Coronation will accordingly be a good thing for timber merchants. Scantling and planks are now in active demand at full prices.

With respect to prices generally, it may be stated that Quebec spruce, 3 x 11, has lately sold at £9.15s. to £10 per standard; 3 x 9, 3rd quality, at £10.5s., and 4th at £9.5s. Quebec pine, 3 x 11, 3rd quality, has brought £15.5s.; 3 x 9, £12. 10s., and 4th quality £9.5s.

Pitch pine of good quality has been in more demand, and prices are very firm. Inferior wood continues to move slowly, but is fairly firm in price.

It is likely that some of this may be cleared for Coronation structures.

Birch continues in good demand at London, and holders are dealing with their stocks very cautiously. St. John's and Quebec plank wood is scarce, and high prices are being paid for such as is obtainable.

At Liverpool, also, business has improved and a more confident feeling prevails. Spruce deals have been in good demand and have sold at £8 to £8.5s. per standard. Canadian pine has met with a ready sale, but contract business is checked by the prices asked. Quebec pine of first quality is quoted at £25.10s. to £40 per ton; second quality at £16.15s. to £26, and third quality at £13.10s to £17.10s. Spruce boards have been in more demand, and are quoted at £7.5s. to £7.10s. per standard. Birch continues to be well inquired for, and logs coming to hand are readily taken ex quay, at high prices. Planks are also in demand and prices are hardening. From 9d. to 11d. per cubic foot is being asked. Quebec birch sells at 1s.6d. to 2s.4d. per cubic foot, and St. John's, at 1s.6d. to 2s. Pitch pine has had a slightly better sale, but business in this wood continues on a relatively small scale while the stocks of hewn, sawn and planks are still heavy.

At Manchester, more inquiries have come to hand, and sales have been on an improved scale. Spruce has moved freely and stocks have

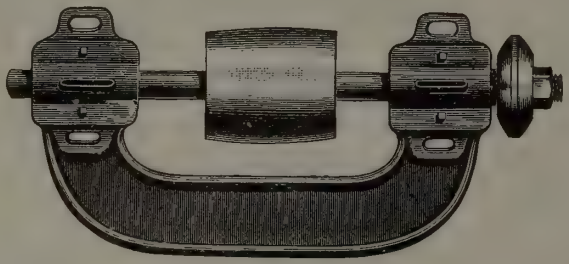
Disston

Mandrels for Circular Saws



In order to obtain the best results and the maximum output from circular saws, a good mandrel is necessary.

You want a mandrel of superior quality and workmanship. You want the best that is made. You want a Disston mandrel. It will give you complete satisfaction.

Disston Mandrels last longer than any other kind on the market. They are the most serviceable. The most reliable. Disston Mandrels are designed to prevent springing or undue vibration. They run true and are the most perfect ever manufactured.

Henry Disston & Sons
Incorporated
Keystone Saw, Tool, Steel and File Works
Philadelphia, Pa.
Canadian Works: Fraser Avenue, Toronto, Can.

been worked down to a small compass. Floorings have sold more readily, and range from £10 to £10.5s. per standard, or £9.15s. unassorted. Deals have also sold well, and 9 x 4 are scarce at the time of writing. Birch has been in good inquiry and stacks of logs and planks are now practically exhausted. Pitch pine has been quiet and holders are making concessions in the hope of effecting sales.

At Bristol business has shown signs of improving, but a run of stormy weather has interfered with sales. At Cardiff business has suffered from the same cause, but the number of inquiries which have been received show that a more healthy demand for timber now exists in the district. The joinery trade is reported to be well employed.

At the Tyne port, heavy gales have affected business, but the shipbuilding industry continues active and a very fair consumption of ship-builders' woods is in progress. At West Hartlepool an improved demand for timber is reported, and consignments to arrive have been eagerly taken in advance. At Hull, the demand for timber has been more active and the outlook for the trade is much brighter. The sawmills have become very busy, and orders for boards and for case-makers' wood have come in freely of late.

At Glasgow an improved business in timber has been done and stocks have been reduced. Whitewood and gum lumber have been in demand and pine deals and general pine lumber have sold more freely. In the hardwood branch, plain and quartered oak have sold readily and a good demand for birch has been maintained, but very few logs have been procurable. Shipbuilding continues active, so that a fair consmption of shipbuilders' timber is insured for a time.

North West Markets Reviving

A Seattle, Wash., despatch says: "After a long period of dulness the northwest lumber market has developed signs of activity. Not only are the stocks on hand at the northwest mills lighter than they have been, owing to the fact that they have filled many orders and that during the past few months many mills have been idle, but the volume of new business is heavier than it has been since last summer.

"Three railroad systems are in the market for lumber. The Grand Trunk is placing orders for approximately 100 carloads. The bulk of this business is expected to go to mills in British Columbia, but manufacturers state that with the northern mills all supplied with orders, mills on the United States side of the boundary will be in a better position to get other business and that prices will be more likely to respond to the increased business on both sides of the boundary.

"The Chicago, Milwaukee & Puget Sound Railroad is buying lumber steadily, having purchased the surplus of many small mills along its lines, in addition to giving the mills sufficient business to keep them working through the month of March.

The Columbia & Willamette river mills have just obtained orders for close to 50,000,000 feet of timber, to be used in double tracking the Harriman lines. The Harriman system will need approximately 340,000,000 feet of ties before the improvement campaign has been completed.

"Lumber manufacturers state that the price of common lumber is stiffening and that there is a tendency toward higher prices even on upper grades."

J. Innes, of the Sutherland, Innes Company, manufacturers of cooperage stock, box shooks and lumber, reports as follows on trade conditions:

"We are very pleased indeed with the conditions of the cooperage business at the present time. Trade is better than usual, for this season of the year, and the prospects for future business are excellent. The only fly in the ointment is that stocks at the mills are very low, on account of the broken winter, more especially where our mills are located in the north, and if the trade is very brisk during the summer and fall it will mean a lot of summer trucking of logs, which is, to say the least, expensive.

"Labor conditions are about the same as a year ago, experienced men are somewhat scarce, but we do not expect any difficulty in being able to man our mills with good men at last season's wages.

"The stocks at the mills have been reduced very low, very few of the mills will carry anything forward into the new year except low grade stock and not any large quantity of that.

"All of the manufacturers report a brisk demand for future delivery, and every indication points to an excellent year for cooperage stock manufacturers."

OWNERSHIP OF LIMITS.—Mr. Justice Murphy, of Nelson, B.C., has given judgment for the defendant in McGardus vs. Hill, a timber limit suit which was partially heard at Nelson on December 20, 1909, and concluded at Vancouver on March 1, 2 and 3 last. The plaintiffs in the action were John McGardus and Walter Steinhoff and the defendant was Leslie Hill. Messrs. McGardus and Steinhoff sued Mr. Hill for $5,000, the balance alleged to be due on 38 timber limits on Bush river, north of Golden. The defence was that 14 of these limits lay within the Dominion belt. This was established, and his lordship gave judgment for the defendants.

The Winged Foot stands for Quality

RUBBER BELTING

Mr. Millowner are you having belt troubles, if so you are not using Goodyear "Quality" Belt, and you are the man we want to get in touch with. Write us fully giving the size and speed of your pulleys and all the conditions under which the belt must work. We will then have our expert go over the information and quote you a price on a belt that we will absolutely guarantee to do the work required.

If you will give us an opportunity we will demonstrate to you that your best insurance against shut downs and long delays is "use Goodyear Quality Belt," every piece of fabric used in its construction is carefully tested and unless it comes up to our specifications it is instantly rejected. Only the highest grades of rubber are used and this makes it impossible for the layers to separate, and also insures a true, straight running belt. Write our nearest branch for further particulars.

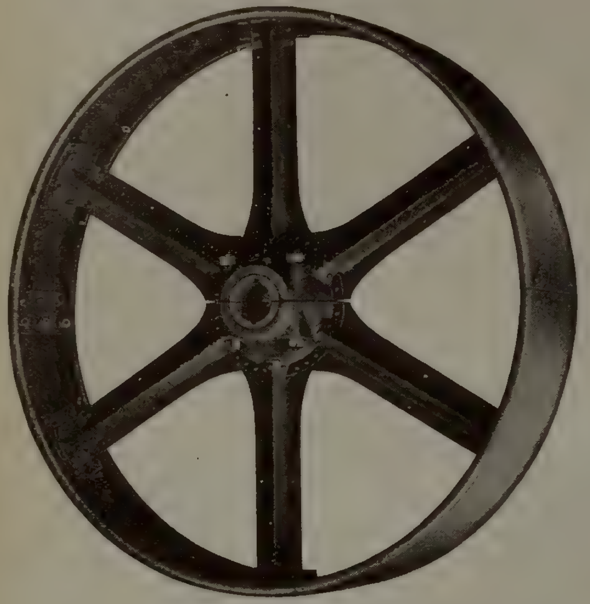
"Just Right"

The Oneida Steel Pulley

is "just right" because it is the only pulley built which fills all the requirements of a good pulley.



It has great strength, best belt adhesion, secure grasp on the shaft, fine balance and it is made in the greatest range of sizes of any steel pulley in the world.

Are not these facts worthy of your consideration when in the market for pulleys?

Try a sample.

A postal will bring our complete catalogue to you.

VANCOUVER, B. C.
Branch at Winnipeg

EDGINGS

Ontario

David Steven, sawmill proprietor, Chesley, Ont., is stated to have assigned to Matthew A. Halliday.

The Kitsmugallum Timber Company, Toronto, has been incorporated, with capital of $1,500,000. Incorporators: W. J. Rooney, G. F. Morrison, R. F. Pack, all of Toronto.

The Skeena-Naas Pulp & Lumber Company, Limited, Toronto, Ont., has been incorporated with capital of $1,500,000. The incorporators are: W. Gamble, barrister, Ottawa, and H. B. Houser, financial agent, Toronto.

Mr. Bluemond, a prominent lumberman of Picton, has been negotiating for a site in Fonthill, Ont., on which to locate a lumber yard. It is not definitely known yet whether a mill will be erected in connection with the yard.

Lynch & Ryan's sawmill, north of Cordova, Ont., was burned to the ground on March 16. There was but $700 insurance on the premises, which will only cover a small portion of the loss. Last year Lynch & Ryan's mill was burned on the 25th of March, and this is the third fire the firm has had in less than four years. They will immediately rebuild.

The machinery for the new planing factory of Messrs. Galbraith, Bumstead & Company at Owen Sound arrived from Chatsworth recently, and is being installed in the new building which is now nearing completion. It is expected that the new factory will be running in a few weeks. The plant will give employment to over 30 hands. Mr. Galbraith, the senior member of the firm, will remove from Chatsworth to Owen Sound.

Hanover, Ont., it is reported, will soon have another new Knechtel industry. It will be a plant to manufacture office desks and sectional book cases. The dimensions of the main building will be 62 x 180, four storeys, the dry kiln 36 x 62. The building is being planned so that the capacity can be increased without disturbing the machinery. It will be a self-contained factory with its own dry kiln, engine and boiler house, and will be conducted independent of the other factories. The firm expect to start with a pay roll of 75 employees, and hope eventually to have 150 men.

Kenora, Ont., is filled with men from the different lumber and tie camps who are coming in after the winter's work before the spring breaks up. Over ten camps, employing altogether three or four hundred men, have broken up recently, and the men come in. The cut this winter is the largest ever taken out, and all the mills will be busy handling the cut this summer, night and day. The Rat Portage Lumber Company will be especially busy, as the company's mill at Rainy River, which was burnt last fall, will not be operating again until well on into the summer. This will mean extra shifts for the Kenora mill, and the summer promises to be a busy one.

The Lake Superior Paper Company, recently incorporated with $8,000,000 capital, has secured the consent of the city council to the release of twenty acres of land purchased from the Lake Superior Corporation, the town holding a mortgage on this property. The trustees of the bondholders receive $150,000 in cash on the execution of the discharge. The $150,000 takes the place of this property. The land includes the buildings on it, which consist of the frame rear extension of the pulp mill, the sulphite mill, and the smelting and reducing works. The buildings are incorporated in the new works. It is stated that the power company is planning the construction of another power canal and a plant capable of developing 40,000 horse power.

Lumber interests along the Ottawa river are much concerned over a bill in the Ontario Legislature which sets aside an old theory that owners of shore lands have riparian rights to the control of streams. The bill affects all navigable streams in Ontario. Persons who have developed water powers under the belief that they have had a legal right to them may continue in possession if they develop them to the limit and sell energy at prices controlled by the provincial government. The measure was attacked by Senator W. C. Edwards, head of the W. C. Edwards Lumber Company. He asserts that there was more power developed than would be used in many years. The obvious object of the bill, he remarked, was to encourage development of the water falls, but what was the use when the demand for the power was lacking.

Statistics of the Dominion Department of Trade and Commerce, just out, show a drop of nearly $1,000,000 in the exports of planks and boards to the United States for the last nine months of 1910, compared with the corresponding months of the previous year. The amount for 1910 is $14,226,000. Lath, palings and pickets fell from $1,750,000 in the last nine months of 1909 to $1,592,000 in the corresponding period of 1910. The most notable decline was in shingle exports to the United States, which fell from $2,000,000 to $1,455,000 in the two periods under review. Deal shipments increased in value from $5,264,000 to $5,937,000. The value of pulpwood exported to the United States increased from $5,036,000 to $5,189,000. The total value of unmanufactured forest product sold by Canada to the United States during the last nine months of 1910 was $25,103,000, a decline of $1,500,000.

Eastern Canada

Mr. Hiram McLean will have a cut of some 4,000,000 feet of lumber this year at his mill at Union, N.S.

The lumber mill of Shearer, Brown & Wills, at Buckingham, Que., took fire on March 17. About 200,000 feet of lumber was destroyed.

The Columbia River Lumber Company, Limited, Toronto, has been incorporated with capital of $5,500,000. The incorporators are: F. H. Phippen, K.C.; G. G. Ruel, G. F. Macdonnell, barristers, all of Toronto.

The Nepisiguit Lumber Company, of Bathurst, N.B., lately in liquidation, have resumed operations at the old Stacy mill, and shipments of lumber have been commenced from the new mill yard near Caraquet Station.

Mr. William Johnson, of Montreal, has been looking over the plant property of the Miramichi Pulp & Paper Company, at Chatham, and expressed a desire to purchase it if terms were satisfactory. The liquidators offer an option at $345,000.

The Laurentide Company, Limited, Montreal, has been incorporated with a capital of $10,000,000, to take over the Laurentide Paper Company, Limited. The incorporators are: R. C. McMichael, W. F. Chipman and O. McMurtry, of Montreal.

The property and plant of the Talbot-Allard Lumber Company, Limited, of Outremont, a suburb of Montreal, was sold by auction on March 22, the purchaser being Mr. Robert Neville, Jr., and the price in the neighborhood of $40,000. The plant consisted of a planing mill and the stock included a considerable quantity of lumber. Mr. Neville being an extensive builder and contractor, will find his new acquisition of considerable value in his business.

Word has been received from England that Mr. Snowball, one of the Miramichi Pulp & Paper Company liquidators, has not succeeded in interesting English capital in that enterprise, and that there is very little probability of his being able to do this on the present trip. It is altogether likely now that the bank, through Mr. Dick, the receiver, will have to see if it can get the mill in operation again. The mill was put up for $345,000, a very reasonable price, and there is no doubt but that it will be running again ultimately.

Western Canada

Henry Finger is building a large sawmill in the Pas district of Saskatchewan. The machinery is on the way and he hopes to have the plant in operation by une.

It is reported that the Red Deer Lumber Company's sawmill at Barrows, Sask., has been destroyed by fire, with a loss of $90,000. The insurance fully covers the loss.

The Yale-Columbia Lumber Company at Nelson, B.C., opened their mill on March 15 after the winter's close-down. The company count upon turning out from 1,000,000 to 1,100,000 feet per month from now until the end of the year.

Waters & Pascoe have commenced manufacturing in their new sash and door factory at Nelson, B.C. It is claimed that the plant is the most modern of its kind between Winnipeg and Vancouver. With an ordinary force its capacity is estimated at 50 doors and 100 window sashes a day.

Three large lumber mills, which will handle lumber from his three timber berths, will be installed, it is understood, this summer by T. A. Burrows, of Edmonton, Alta. It is understood that one plant will be installed in the limit near Jasper Park, and another on the McLeod river.

The Shawinigan Lake Lumber Company, one of the largest corporations of its kind in the west, will open a yard at Merrit, B.C. It is stated also that a lumber mill will be erected in the district during the ensuing year and that the company are now negotiating for the purchase of timber limits.

A proposition is on foot to have 100 French-Canadian families locate on Graham Island, B.C. The construction of pulp mills on Ain river and the possibility of the owners of timber lands opening up sawmills to cut the large quantities of spruce on the island, will bring in a large number of settlers during the coming summer.

A portable sawmill with a capacity of 25,000 feet a day, will be put in on Bridge creek, near Moyie, B.C., as soon as the machinery can be hauled to the mill site, which is about one mile and a half up the creek from Aldridge. At least 50 men will be employed. The head men of the company are J. W. Fitch, of Moyie, and H. R. Hazelwood, of Cranbrook, for some time connected with the tie department of the C. P. R.

The Patrick Lumber Company, Limited, of Nelson, B.C., have sold to the British Lumber Corporation, with headquarters at Montreal, their mill at Crescent Valley and its 9,000-acre tract of white pine, spruce and cedar timber, on the east and west branches of the Little Slocan river. The price was one million dollars. The sawmill's capacity on an ordinary run is 30,000,000 feet per year, and the plant is claimed to have no superior in the interior.

A proposal has been made by the city of Calgary, Alta., to the Eau Claire Lumber Company for the latter's electrical plant, a subsidiary concern operating under the name of the Calgary Water Power Company. It is understood that the lumber company is not willing to sell the plant separately, and will try to dispose of all its holdings for $1,500,000, including a sawmill and about 175,000,000 feet of standing timber in the mountains.

Construction has been commenced by the Penticton Lumber Company on their sawmill at Penticton, B.C. Active sawmill operations are expected to commence within two months. The mill will have a capacity of 35,000 feet of lumber a day and a large drying kiln will be built by the company in the vicinity of the mill. Plans have been prepared for extensive yard accommodation and subsequently a pipe and box factory will be built. It is the intention of the company to make a bid for a very wide market. The concern has secured splendid tamarack berths.

Sawmills owning timber limits south of the Fraser river, B.C., which have not hitherto been cut, on account of the lack of transportation, will be enabled to work many of these limits now on account of the facilities afforded by the Chilliwack tram line. In anticipation of this, the B. C. Electric Railway is building a loop from its Chilliwack line on the south side of the river to the west of the Westminster bridge along the waterfront. This line is for the purpose of dumping logs from the cars into the river where they can be boomed and taken to the mills.

Some time ago difficulties were encountered in connection with the operation of the British Canadian Wood Pulp & Paper Company at Port Mellon, on Howe Sound, not far from Vancouver. The latest proposal is that the property be taken over by a company headed by Lester W. David, a prominent operator on the coast. Mr. David has agreed to organize a company to take over the property of the B. C. Wood Pulp & Paper Company at a capitalization of $2,500,000, in shares of $1. He will assume the indebtedness of the old company, approximating $225,000. In consideration the assets will be transferred to Mr. David for 427,000 preference shares. The old company will have the selection of one-third of the members of the board of the new company.

A large Frost engine is now being installed at the Eburne sawmills, Eburne, B.C., to cope with additional work. The B. C. Electric Railway Company is also putting in a spur from the station to run in logs to the mill from Mount Lehmon, whence it is expected to bring in some 60,000 feet a day. The sawmill company have between eighty and ninety million feet of timber at Mount Lehmon. An important addition to the plant of the mills is the installation of a steam drying kiln, which not only dries the lumber perfectly in twelve hours, but also kills all the pitch in it. Under the old process it took from four to six days to dry the lumber, which now occupies half a day, and that without any fear of "checking" or splitting of the lumber. The capacity of the kiln is 18,000 feet of lumber every twelve hours.

The Barnhart Log Loader

has been in successful operation in all parts of the country for twenty years and never caused a complaint. We are now manufacturing a new Barnhart Loader known as **Model "12,"** which is specially designed for use in very heavy timber. This loader is built on the same lines as the old Barnhart Loader now known as Model "10" and which we still continue to manufacture. We are operating lumbermen, producing 200.000.000 feet of lumber per annum and we use the Barnhart Loader exclusively. Could we afford to do so if it were not the best? Write us for prices.

The Worth of a Cutter Head

Is based upon that which it will do and the length of time it will continue in satisfactory service.

Its best service will always depend upon the material of which it is made as to whether it will be a good and lasting investment. A Cutter Head runs at high speed and is subjected to enormous strains depending on the kind and quality of the lumber that is being worked. Hard and knotty maple tests the material of which the Head is made.

STEEL FORGINGS, with a guaranteed tensile strength, form the basis of material for the SHIMER CUTTER HEADS—that is why they stand the tests which are so remarkable for endurance. That is why you should equip all your machines with the Shimer Cutter Heads and reap the benefit of their best service.

We make a number of Heads for special purposes. Upon any design of material you get out in quantity let us give an estimate on the Head to do the work. Our prices are uniformly low—our goods of best quality.

Samuel J. Shimer & Sons

Illustration shows plant of the Robinson Clay Products Co., Akron, Ohio, which was covered with J-M Asbestos Roofing over twenty years ago. Although this roofing has had to withstand the deadly gases used in manufacturing clay products in addition to the elements to which all roofings are subjected, it is in perfect condition to-day.

J-M Asbestos Roofing is not in the least affected by gases, chemical fumes, fire, salt, air, heat or cold. It is practically indestructible because made of sheets of indestructible asbestos—a rock quarried like slate or granite—firmly cemented together with Trinidad Lake Asphalt, the mineral which has withstood the severe duties of street paving for more than thirty years.

J-M Asbestos Roofing is the cheapest-per-year roofing on the market, because it outwears several ordinary roofings and never has to be painted.

Its High Daily Average, its ability to always keep a surplus of logs skidded ahead for the leading crew is what places the

CLYDE SELF-PROPELLING STEAM SKIDDER

in a class by itself. Its absolute independence of the loader prevents any interference with its fullest skidding capacity at all times and its self propelling feature saves in both moving and skidding besides the expense of switching.

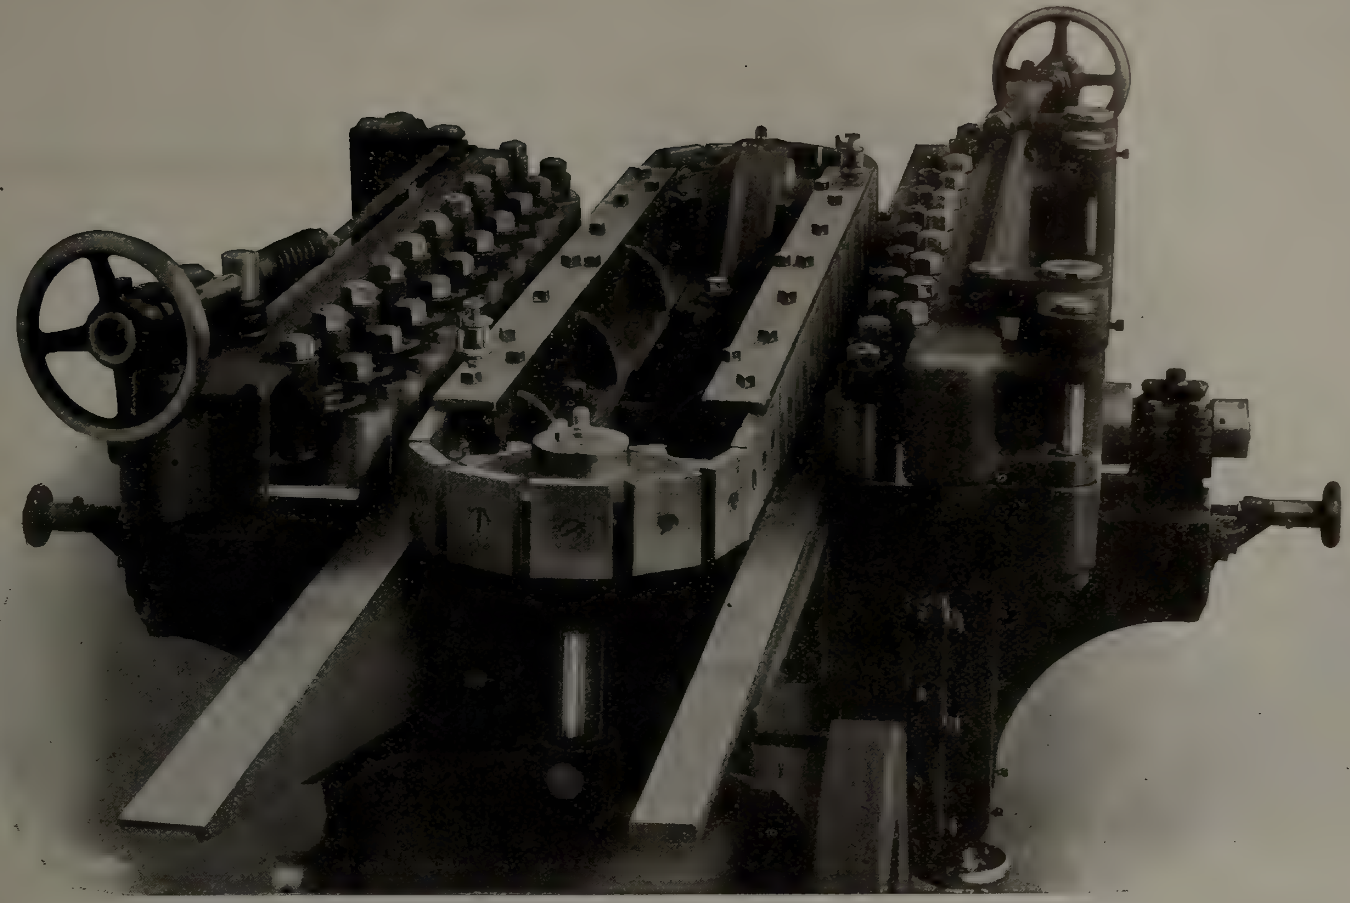
Berlin No. 213 Glue Jointer



Your Conception of a Glue Jointer

There was a time when we didn't make a glue jointing machine.

During a conversation between one of our branch office managers and a furniture man who had bought several of our sanders, the later stated that he had just bought some new machines.

Their conversation follows :

"What did you buy?"

"A couple of glue jointers from So-and-So."

"Do they make a good machine?"

"Oh, as good as any. But, do you know, none of them are what I want. Why don't you people make one."

"Tell me what you expect of it, and perhaps we will."

"Well, I want a machine first, that will handle short stock up to, say, six feet long and handle it four or five times as fast as we can handle it on a hand feed machine. Next, I want a feeding mechanism that will be absolutely positive, that will hold the stock firmly so it cannot slip backwards, jump forward or raise up. Then I want the working parts accessible and some sort of a lever so the machine can be started and stopped instantly from the in-feeding end.

"Now, if you will make such a machine and mount it on a one-piece base to prevent vibration, you can have my order for several."

Isn't that **your** idea of what a glue jointer should be? It describes, with one exception, our No. 213.

The exception is this :

Instead of an output of four or five times as great as a hand-feed machine, our No. 213 has an output **eight times greater.**

The automatic feed makes this possible. It is the one feeding mechanism which provides maximum output yet is absolutely accurate and positive.

Every provision is made for making quick adjustments. A lever at the in-feeding end starts and stops the feed. The cutter-head carriages are adjustable in three directions, providing for perfect alignment with the feeding mechanism.

The four-page folder of the No. 213 goes into detail regarding construction, and contains several pictures. Send for a copy—**to-day**—and learn how to cut your glue-jointing costs.

Isn't it Better to Investigate

"The HOWARD" Vulcanizing Process

than to wish you had

Positively the quickest and most economical system known for drying and Preserving Lumber, Railroad Ties, etc.

POINTS IN ITS FAVOR:

Does away with all kilns
Improves quality of all lumber
Increases the crushing strength
Increases the transverse strength
Reduces the weight 30 per cent to 45 per cent
It materially prolongs the life of wood
Eliminates shrinking, swelling and warping
Emphasizes and beautifies natural grain of the wood
Makes fit for commercial use woods not otherwise merchantable
Does away with necessity of maintaining heavy stock of lumber in yards
By this process green lumber taken from the log can be used for building purposes in 2 or 3 days

---

We invite Lumbermen and Owners of Woodworking establishments to see a practical demonstration of the process at our plant in Toronto

NO. 264 SELF-FEED RIP SAW—For Heavy Ripping of all kinds.

NO KICKING BACK

when short pieces are ripped on a Fay & Egan No. 264, Self-feed Rip Saw. The Spring Hold Down and the additional Spiral Springs prevent accidents of this kind.

This, however, is not the only reason why it is to your advantage to buy a Fay & Egan Self-feed Rip Saw. There are other reasons—read them in the opposite column.

A few words about this self-feed rip saw—built for heavy ripping and will be found a satisfactory tool for both light and heavy work—can be used as a single or gang rip-table raised and lowered on worm segments—long self-oiling bearings—outside bearing to mandrel pulley—fence is instantly moved and clamped at any position—a graduated index is furnished for accurate ripping—feed consists of one infeeding and one outfeeding roll. The driving mechanism is is the strongest possible, consisting of a train of sprocket gears and chains regulated by a Three Step Cone Pulley—capacity for material 4″ thick with a 16″ saw and 8″ with a 24″ blade; takes 19″ between saw and fence. By lowering the table and raising the feed out of the way, a timber as large as 12″ thick can be ripped by reversing timber.

We make the most complete line of Circular Rip—Cut-off and Resaws on the Market.

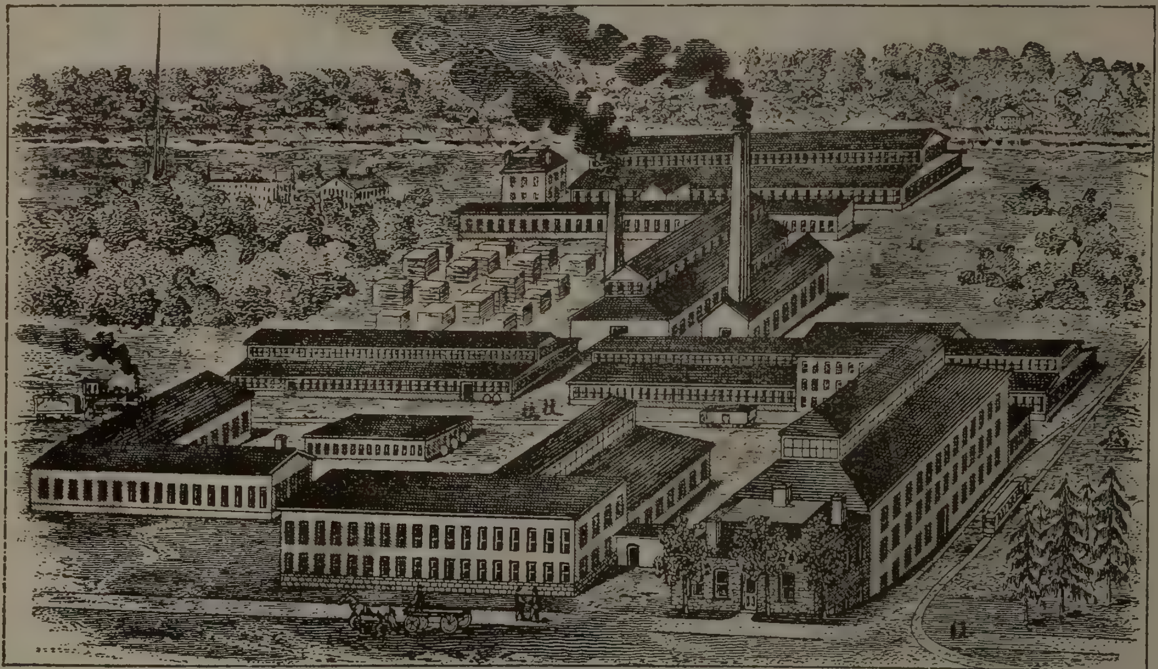
MOWRY & SONS **Gravenhurst Ontario**

MAPLE LEAF SAWS

The Improved Racer Cross Cut Saw, by Actual Test, is the Fastest and Easiest Cutting Saw Made

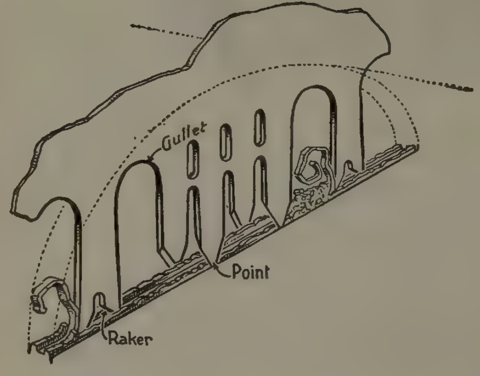


The Maple Leaf saw is higher priced than the ordinary saw because it costs more to make it. It is made of the very highest quality of steel and tempered by a secret process which toughens and refines the steel. The Maple Leaf trade mark on the saw means that it is the equal, if not superior to any saw made. It also means that you are privileged to test it against any other make and if not found equal or superior in quality you can return it and have your money refunded.

The ambition of the manufacturers of the Maple Leaf Saws has always been to produce the best tempered saw in the world and they are constantly investigating and experimenting with this end in view. They have recently made some valuable discoveries in evenness of temper. It has always been difficult to get a perfectly even temper on long and thin sheets of steel, such as saws are made of. Our recent discoveries make this an absolute certainty. Every user of saws should bear in mind that the temper of the saw is its most valuable quality. High finish and attractive appearance amount to nothing if the temper is not right.

All Maple Leaf Saws are Guaranteed to be Perfect in Temper

Shurley-Dietrich Co., Limited **Galt, Ontario**



Why Atkins Sterling Saws Run Free and Easy

Saws that depend on "set" for clearance have to tear their way through the timber, like the picture to the left. The teeth are sprawled out on either side and chatter and stick and bind and tear. That's why wood sawing is sometimes considered such hard work. That's why commonly ground saws can NOT run fast or pull easy.

ATKINS SEGMENT-GROUND CROSS-CUT SAW BLADES are ground thinnest on the center of the back. The teeth are the widest part, and the blade drops easily into the smooth cut which is made by the saw teeth. Very little set makes the teeth cut clean and the rakers clear the center. See the picture to the right. These Saws merely require enough power to pull them back and forth. That's why they run so easily.

ATKINS STERLING CROSS-CUT SAWS are the only Saws that are Segment-Ground, and for this reason are guaranteed to run easier and cut faster than any other Saws. Write us for free information, or order through your jobber or dealer. If they won't supply you, let us know.

"COVEL"
SAW FILING TOOLS

¶We are the only authorized Canadian manufacturers of Covel Saw Filing Equipment. ¶We underline "authorized" because it has an emphatic meaning. There are others selling what they represent to be Covel Filing machinery. So it is. But it is years out of date. ¶It has been superseded by newer designs that have been evolved and placed on the market because they are better than the old. ¶Being the authorized builders of these tools, we are in direct and constant touch with the designers. Every model they turn out and every improvement added is embodied in the machines we sell you—the latest and best in the Filing Tool line. *Send for our Filing Tool booklet.*

AUTOMATIC BANDSAW SHARPENER NO. 150

The No. 150 Automatic Bandsaw Sharpener illustrated herewith will take a saw with a blade up to 20-in. wide, and with slight variation is built as Nos. 140, 130 and 120, to take saws with 16-in., 14-in. and 10-in. blades respectively.

Frame

The machine is entirely self contained. The frame is built most substantially to overcome all vibration, and is open to permit quick adjustment and easy overhauling of every part. Over-all dimensions 50-in. x 55-in., extreme height 65-in.

Sharpening Head

The sharpening head is adjustable to give a concave cut with a straight wheel, and will set through a 45 degree angle to accommodate the hook of saw teeth. A 12-in. emery wheel is used, has three speeds, and is driven direct from the countershaft. This is made possible by the automatic idler attachment—a new wrinkle—that keeps driving belt always in the same tension regardless of the position of the emery wheel, and holds the belt always in the centre of the pulleys no matter at what angle the head is set. The sliding gate is 1¼-in. thick, slides in "V" shaped gibs so that wear can be taken up by adjusting one gib only. The gate rod controlling the position of the gate in the head is operated by a handle at the front of the gate which permits adjustment without hiding the wheel from the operator, and does away with the necessity of lifting the saw over the screw on the head. A ratchet lever is provided which raises gate and stops motion of the same when cams are being changed or when feed is regulated. All sizes and shapes of teeth can be sharpened, from 1-in. to 4-in. space. Each machine has five cam forms, giving as many standard sized teeth. Each cam is adjustable on the holder to give a large assortment of different shaped teeth. The cam shaft has two speeds and is cone pulley driven from the side of the machine where the belt can be easily regulated or shifted.

Front Feed

The feed arm is pivotted in double, babbitted boxes at the extreme bottom of the frame, making the push on the saw almost in a straight line. As it feeds the saw ahead it also holds it down so that it cannot climb. An adjustable guide holds arm in exact line, and a pull spring attached to it ensures a smooth even movement. Our patented adjustable knife shaped feed finger is furnished. This finger is flat, of ⅛-in. x ⅝-in. high speed steel, has lost motion take-up, and when worn can be readily removed. A replaceable hard tempered steel slide is provided, as is also an adjustable feed finger stop by which over-feed is avoided.

Back Feed

The back feed is simple, positive, and strong. The 1¾-in. shaft put through the bottom frame, carries rocker arm which works against back feed cam. This is round and adjustable from the centre to give more or less throw of back feed finger. The latter can be turned up out of the way and will not interfere when saws are being changed.

Saw Rest

The front bar on which saw slides is 5 ft. long, is furnished with square hardened steel saw rest adjustable so that its four faces can be used. The saw is raised and lowered by crank and sprocket chain shown in cut, making it unnecessary to stoop under saw.

General Construction

All connecting rods are forked, have double bearings to give even and uniform wear on all bolts and bearings. All wearing surfaces are planed and scraped; all boxes are large, are babbitted and scraped, and oil reservoirs are furnished at each bearing.

"Weldless Steel Chain"

The Strongest Chain
in the world

WELDLESS—The finished Chain is rolled direct from the bar without a weld.

STEEL has an approximate Breaking stress of 65,000 lbs. per square inch against 52,000 lbs. for the highest grade of iron, and where the Weldless Chain has 100 per cent. efficiency the welded article has only 60 to 70 per cent.

Write for descriptive matter, Breaking Strains, &c. and prices to

B. J. COGHLIN CO., Limited ∴ ∴ **MONTREAL**

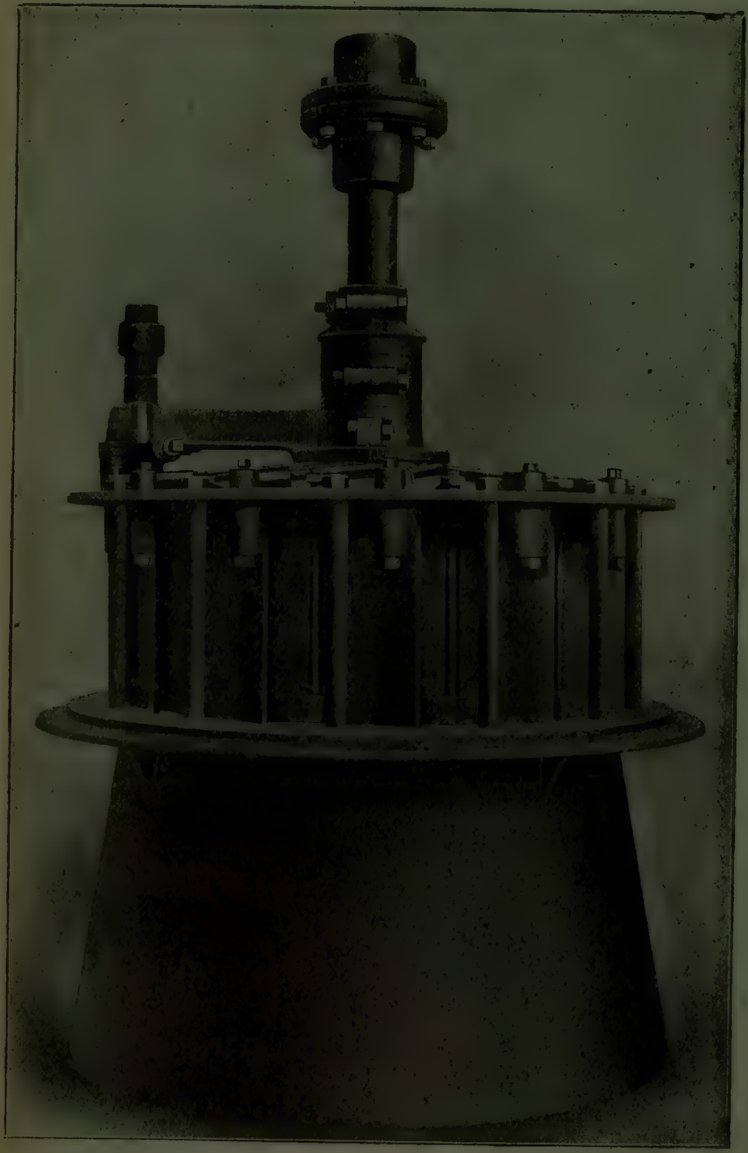
Samson Turbine Water Wheels

Possess many features that ought to interest sawmill men. They are powerful, fast running, steady, durable and are easily operated and controlled.

The power is developed by a wheel or small diameter running at a high speed, which means low installation expense and smaller gears between the wheel shaft and your main shaft.

Then, they run steadily and are easily controlled—both very important points in your work.

A great many sawmill operators are now interested in electrical power for driving their mill. If you have a water power available, why not consider a hydraulic equipment for operating your electrical machines



Our wheels can be set in any position and will meet all requirments, and with our knowledge of sawmill machinery and our experience in building water wheel plants, we can probably be of some assistance to you.

If you are interested in water wheels, write us

ED. T. SAXE, 200 Claremont Ave. MONTCLAIR, N. J. **OTTAWA, ONT.: Citizen Building**

440 Square Miles Timber Limits

on Georgian Bay

to be Sold by Private Sale in Large or Small Blocks.

On account of their President and Principal shareholders being engaged in other large enterprises, and not having the time to give to them all, THE PARRY SOUND LUMBER COMPANY, Limited, offer for Sale all of the timber lands, mills and town property situated in the Town of Parry Sound; also Tug Scow and full Camp Equipment for five camps, including boom chains, snow plows, sleighs, etc.

THE LIMITS TO BE SOLD

comprise some 440 square miles of licensed and deeded Pine, Hemlock, Spruce, Birch and other timber. The licenses from the Ontario Government include all timbers and are not restricted for time. Government dues are as follows: Saw Logs, White Pine, $1.50 per M. ft., B.M. Saw Logs, Hemlock, Tamarac and other woods 75c. per M. ft. The timber is situated in the Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street. The Canadian Pacific, Canadian Northern and Grand Trunk Railways run through the limits, which makes some of the parcels offered for sale particularly desirable for small mill owners.

A circular giving full information, maps, terms and conditions of sale will be furnished upon application to

The Parry Sound Lumber Co., Limited

1315-20 Traders Bank Building, TORONTO, CANADA

Booth & Shannon

Biscotasing, Ont.

Established 1889

We are open to contract for the output of our present season's cut of

Norway and White Pine Logs

Stocks will be sawn at Biscotasing, Ont., C.P.R. main line and at Spanish (Georgian Bay).

SHINGLES SHINGLES

Now is the time to place your order for your spring trade. Stocks are running low at the mills and prices are likely to advance owing to short cut and higher stumpage. We still have a few Cars of 2nd Clears, Specials and Extra No. 1, Summer Cut Metis Brand which lead the procession in quality.

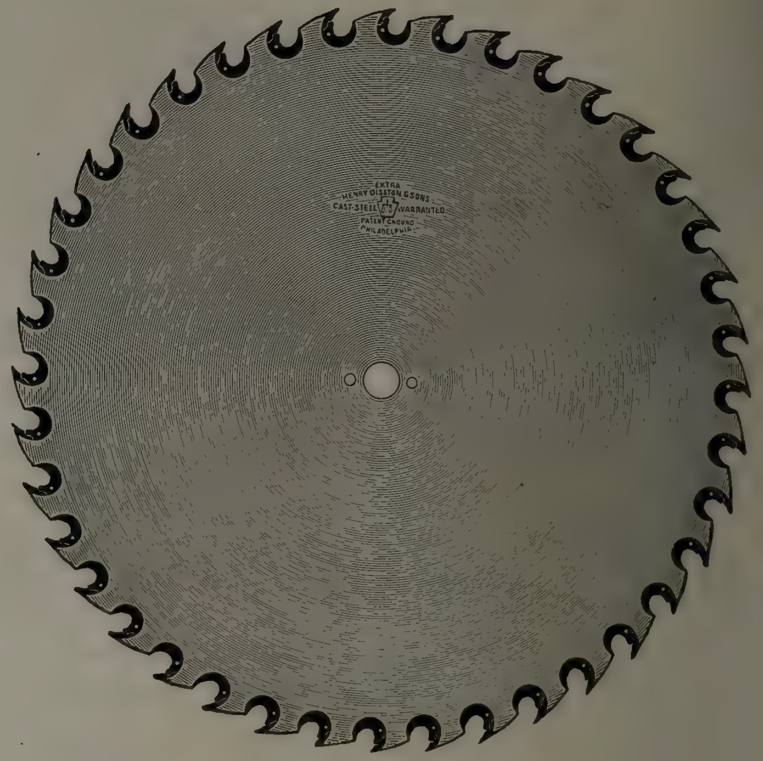
Disston

Saws, Files and Tools



For fifty-six years we have been making Disston crucible steel. It is made under the exclusive Disston process. The long life and cutting properties of Disston Saws are due to Disston Crucible Steel and the treatment it undergoes in our shops.

The Disston establishment is the **only one** making steel for its full line of saws and tools—one reason why Disston Saws are uniformly durable and efficient.

Disston Saws are hardened and tempered by the exclusive Disston process.

It pays to buy Disston Saws and tools. For any and every kind of work Disston Saws, Files and Tools are the most reliable.

We have been making Saws for over 71 years.

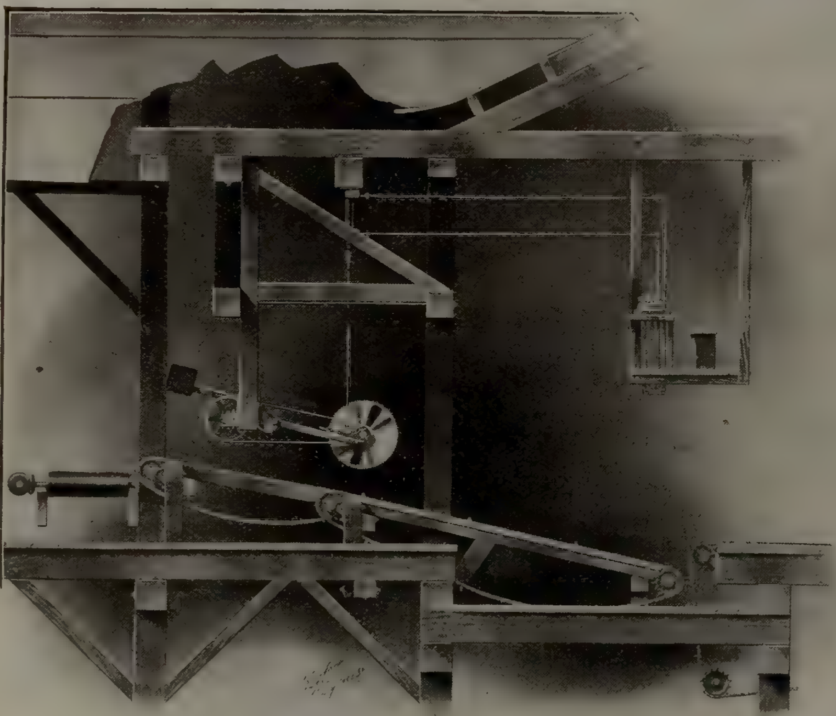
The Clark Heavy Duty Saw Mill Machinery

Includes among its Leaders



The Clark Heavy Duty Pneumatic Trimmer

Saw frames are perfecly balanced. And telescope for tightening belts. Cylinders are double acting. And cushion at both ends. Pistons packed with double snap rings. Saw arbors are extra heavy. And suitable for 30 to 34-inch saws. Arbor pulleys carry 8-inch belts. Machine trims stock 10 inches thick. Built with any desired length of table. And any number or spacing of saws. Variable feed furnished when desired. Countershaft bearings are adjustable in both directions. Keyboard lowers saws independently or in any desired group. A single lever lowers every alternate saw or raises all saws at pleasure. Steam coils or steam connections are provided for all styles of keyboard. This prevents ice formation at exhaust, an invaluable feature. The above type of machine is also equipped with single acting cylinders. We also build under cut trimmers controlled by pneumatic power. For complete details and illustrations of the several types see our trimmer catalogue. We build every machine required in an up-to-date high service Band or Circular Mill. Ask for our catalogues.

Let us ship you this
HOLLOW BLAST GRATE
on APPROVAL.
You need not keep it
if it is unsatisfactory.
WE pay the freight.

On the market twenty years, first in its original and then in its improved forms. Over 6,000 sets in daily use.

The following is a sample of our correspondence :

Before Using
Cleveland, O., Dec. 10th, 1907.

The Gordon Hollow Blast Grate Co.
Greenville, Mich.

Gentlemen:
I have three 300 h.p. Wickes Vertical Boilers with Dutch ovens attached to a 4-ft. chimney in use at my saw mill, burning all wet fuel, but I am not able to raise enough steam. Each grate surface is 7 ft. wide by 6 ft. long.

Will your hollow blast grate improve my condition and raise my steam?

If so, I would kindly ask that you give me your price on same.

Awaiting your reply, I remain
Very truly yours,
THEODORE KUNDTZ.

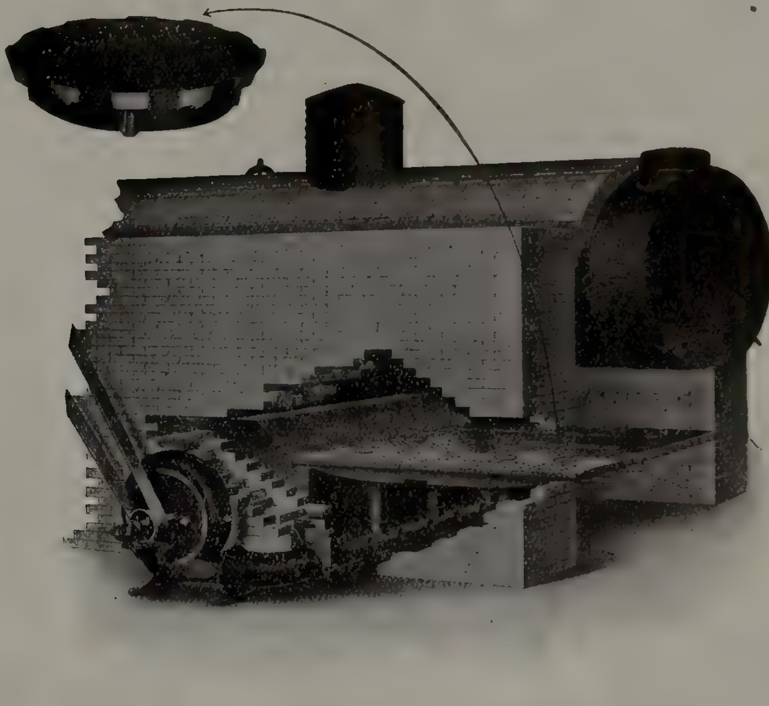
After Using
Cleveland, O., July 24th, 1909.

The Gordon Hollow Blast Grate Co.,
Greenville, Mich.

Gentlemen:
I had three 300 h.p. boilers in use at my saw mill, burning mostly wet fuel, and WAS NOT ABLE TO RAISE STEAM ENOUGH TO KEEP RUNNING.

Since installing your hollow blast grate I have been using only TWO of the boilers and have STEAM TO SPARE and I would recommend your grate to anyone using WET FUEL or NOT HAVING CHIMNEY DRAFT.

Very truly yours,
THEODORE KUNDTZ.



The Gordon Hollow Blast Gate can be used in plain furnaces or Dutch ovens, and with any number of boilers, from one up. Calls for no change in construction. Easy to install and operate. Saves labor in firing. Is kept comparatively cold by the current of air within, which makes it practically indestructible. Does not throw sparks. Can be fired on without running the blower, if desired. This is often necessary at night.

In writing for prices state how many boilers you have and whether you have ordinary furnaces or Dutch ovens, and give width and length of grate surface or surfaces

Gordon Hollow Blast Grate Co., - Greenville, Michigan

Simonds Saws

By the building of our new steel mill in Lockport, N. Y., the expression—

Made of Simonds Steel

will have a wider range of influence. More of our Saws can be made with this increased supply of the fundamental material. Quicker deliveries may also result.

Year after year we have been alert to furnish millmen with Saws above the average in quality. Our policy has been conservative, yet every Saw improvement of real merit has been instantly taken up by us and brought before the trade.

We prove first to our own satisfaction that a Saw, Knife or File is right. Then—but not until then—we let the mill have it. Our experience and endorsement are accepted by buyers everywhere as a guarantee of quality.

Our pocket size catalog should be in every mill.

Canada, United States and Great Britain, $2.00 per year in advance; other foreign countries embraced in the General Postal Union, $3.00.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Vol. 31 Toronto, April 15, 1911 No. 8

Lumber Exports Show Decrease

Canada's foreign trade for the month of January and for the ten months ending with January, 1911, shows substantial increases in imports and a slight falling off in exports. Imports for the month of January were valued at $36,663,957, against $30,253,852 in January, 1910. Total imports for the ten months ending January, 1911, were $376,481,520. For the ten months ending January, 1910, the total $302,050,207. Exports for January, 1911, were valued at $19,767,490, whereas in January, 1910, the total was $21,546,250. Exports for the ten months ending with January were valued at $257,949,555 in 1911, and $262,236,573 in 1910. Among the exports there was a decrease in forest products to the value of nearly $1,500,000 during the ten months. Exports of animals and their produce decreased by about $1,700,000. The most noticeable decrease was in the agriculture class, amounting to about $11,000,000. Slight increases occurred in exports of the mine, and of manufactures.

Exports of forest products during January, 1911, amounted in value to $1,408,439. In January, 1910, they amounted to $2,233,316. For the ten months the total exports were as follows: 1911, $41,606,601; 1910, $42,981,454. Imports of forest products for January, 1911, were valued at $843,361, and for the ten months ending January the total was $10,425,893.

Among the exports of forest products those of planks and boards amounted in value during the ten months ending January, 1911, to $19,655,466. Of this amount the exports to the United States amounted to $14,712,884; those to the Argentine to $2,051,582, and those to Great Britain to $1,502,928.

Exports of spruce deals were valued at $6,436,563 for the ten months. Of this amount, the exports to Great Britain alone amounted $6,024,573. Exports of pine deals amounted in value to $1,463,722, of which the exports to Great Britain amounted to $1,375,752.

Exports of shingles during the ten months were valued at $1,534,669. Of this amount $1,502,379 was to Great Britain and only $27,907 to the United States. The exports of laths for the ten months were valued at $1,580,935, of which $1,509,076 went to the United States. Scantlings were exported during the ten months to the value of $1,136,177. Exports of pulp wood amounted in value to $5,542,699, all of which was sent to the United States.

The imports of planks, boards, etc., free of duty, amounted in value to $2,888,900 during the ten months, practically all of which was from the United States. Imports of dutiable sawed boards, planks, deals, etc., amounted in value to $221,000. Other free imports were as follows: Lumber and timber planks and boards of cherry, chestnut, gumwood, hickory and whitewood, $554,284; mahogany, $286,846; oak, $1,894,684; pitch pine, $1,838,800; Spanish cedar, $46,158; walnut, $23,805; white ash, $91,328.

Pacific Coast Lumber Markets

That the lumber markets of California are worth while going after is something that the manufacturers of British Columbia have known for a long time, and they are looking forward to going after the business with all their might if the proposed reciprocity agreement is ever passed, giving them free entry with their rough lumber into the United States. British Columbia manufacturers have long felt that they had a grievance that ought to be remedied, on account of the free entry of rough lumber into Canada and the duty on rough lumber entering the United States, which kept them from retaliating against the producers of that country when the latter gobbled up so many good contracts in the Canadian prairies. The natural remedy which they proposed was a duty on lumber entering Canada, equal to that on lumber entering the United States. No Canadian government, however, has ever been able to see it in this light and the result has been that British Columbia manufacturers have had to get along as best they might and swallow their grievances.

The reciprocity situation, however, places the whole matter in another light, and British Columbia manufacturers are already counting upon the advantage they will have in the United States coast markets on account of their ability to ship lumber in foreign bottoms, a privilege which United States manufacturers cannot avail themselves of, in making shipments to United States ports.

An illustration of the value of the markets of the United States Pacific coast is afforded by figures which have recently been published in regard to the consumption of lumber at Los Angeles. This city is fast taking its place as one of the greatest lumber ports of entry in the United States, a fact which is demonstrated by the last report of the customs house. During the month of February, 51,733,000 feet of lumber were received at the port, which it is claimed was the largest amount of lumber received at any port in the country. It is believed, moreover, that this increase will continue, especially when docks and wharfs are provided. Tide lands are to be regained and shipping facilities provided which are now lacking, and a much larger tonnage will be unloaded. The people of Los Angeles are doing all they can to improve their shipping facilities, and it will pay British Columbia manufacturers to give this market a careful study. When Canadian lumber enters the United States free of duty it is certain that this market and others in the same State will consume large quantities of it. The report of imports in detail at Los Angeles for the month of February is as follows: Domestic imports—Lumber, 43,855,000 feet; shingles, 15,439,000; shakes, 340,000; laths, 6,544,000; ties, 14,091; piles, 934; poles, 2,899; posts, 550; spars, 2; doors, 24,114; windows, 500; staves, 27 tons.

U. S. Reasons for Free Lumber

An interesting review of the considerations which led to the adoption of the changes in the lumber duties which are included in the reciprocity agreement between Canada and the United States is given in some papers which were recently presented to the United States Senate. After reciting the bill, the papers review a number of the important provisions which it includes and upon the matter of lumber they have to say:

"The chief purpose in making rough lumber, laths, palings, etc., free, and in reducing the duties on planed lumber and shingles, are to help home-builders, particularly of the Prairie States. This proposition is, therefore, very largely in the interest of the farmers.

"Mr. Hines, in his testimony before the Finance Committee, makes the point that Canada remits only $14,707 on lumber products as against $1,616,000 remitted by the United States. In his testimony Mr. Hines suppresses the fact that Canada does not make larger remissions of duties because rough lumber, lumber planed on one side, laths, and shingles are all free. She could not, therefore, add to the total of remitted duties.

"The duties on dressed lumber imported into Canada from the United States, as they appear in Schedule C, are simply a recital of what the duties are under the Payne-Aldrich law, with the duty on rough lumber subtracted. They contain no new provisions. The United States was not able to concede Canada's request that lumber planed on one side should be made free. In consequence, it was not able to press for Canada to lower the duties on tongued and grooved lumber or that planed on four sides. Nor was it able to grant Canada's request that many miscellaneous articles of which lumber is the chief material, which are comprised under the Canada tariff No. 502, and which are free when imported into the United States from Canada, be admitted into the United States free.

"If, on lumber planed on four sides, the Canadian duty is higher than that of the United States, it must also be considered that lumber planed on one side is free into Canada and not into the United States. The average of duties on lumber of this class would probably be about the same. The total remissions of duty made by the United States on dressed lumber are not large, because the purchases of all classes are only $1,100,000, and the duties remitted are only $68,000, out of a total of $106,000.

The following topical synopsis is based upon statistics for latest available year:

Imports—

Rough Lumber:

Purchases from Canada by United States	$17,942,121
Duties levied by United States	1,223,624
Duties to be abandoned by United States	1,223,624

Entire United States duty, $1.25 M. feet, is removed from lumber not further manufactured than sawed.

Planed or finished lumber:

Purchased from Canada by United States	$1,104,716
Duties levied by United States	105,947
Duties to be abandoned by United States	68,108

United States reductions are as follows:

Planed on one side, now $1.75 M. feet, to be 50 cents M. feet.
Planed on two sides, now $2 M. feet, to be 75 cents M. feet.
Planed on three sides, now $2.37½ M. feet, to be $1.12½ M. feet.
Planed on four sides, now $2.75 M. feet, to be $1.50 M. feet.

Shingles:

Purchased from Canada by United States	$1,759,397
Duties levied by United States	381,398
Duties to be abandoned by United States	152,559

United States returns to Dingley rate, 30 cents per 1,000, abandoning Payne rate, 50 cents per 1,000.

Laths:

Purchased from Canada by United States	$1,802,144
Duties levied by United States	144,364
Duties to be abandoned by United States	72,182

United States reduces from 20 to 10 cents per 1,000 pieces.

Staves, palings, telegraph poles, etc.:

Purchased from Canada by United States	$994,201
Duties levied by United States	99,420
Duties to be abandoned by United States	99,420

The following United States duties abolished:

Telegraph poles and railroad ties, 10 per cent.; staves, 10 per cent.; stave bolts, 20 per cent.; pickets and palings, 10 per cent.

From the above figures it will be seen that on a total import valued at $23,602,579, the duties under the Payne-Aldrich tariff are $1,954,753. Under the reciprocity agreement the duties to be levied on the same articles would be $338,860. The duties which it is proposed to abandon would amount, on the same articles, to $1,615,893.

Periodical Reports on Manufacturing Costs

The word "system" has been overworked so much of late years that one hesitates every time one has to make use of it. Yet there is no other word which so definitely expresses the importance of paying minute attention to the essential details of business, and seeing that they are all placed upon an orderly and profitable basis. In the lumber industry as much as in any other, the necessity of systematic attention to detail is all important. At the very outset, for instance, of the manufacturing end, one must take into consideration the size of the plant required, and its production. To reach successful conclusions upon matters of this sort it is necessary to provide oneself with a great deal of information which can only be secured by systematic study of the results of experience.

It becomes clear to every one who is engaged in the lumber business long enough to discover its innumerable possibilities of loss, that the most effective method of preventing financial embarrassment is to have prepared regularly, a series of reports upon all essential conditions connected with the business.

System producing as a profession has probably been greatly overdone and has led to confusion in many cases instead of improvement. For this reason any system of daily, monthly, or yearly reports must be carefully planned, and the reports must contain only those facts which are essential to the thorough understanding of the financial and economic standing of the business. If they are overburdened with details which can be dispensed with, they become a source of irritation instead of benefit.

To strike the happy medium between excessive detail and necessary information is not a very difficult matter, yet it is often the stumbling block in the introduction of a system of peridoical reports.

The average mill manufacturing company will not find it necessary to prepare a daily cost statement in detail, yet there is no gainsaying the fact that reports from day to day, showing the number of men employed, the working hours of the mill, the number of logs received and quantity of lumber produced and disposed of, and a cash summary together with general remarks on the day's work, are of great value. The preparation of reports containing information of this nature might seem rather a stupendous matter to anyone not familiar with it. It looks at first as though it would involve the employment of quite a number of extra men and the expenditure of a considerable amount of additional money. As a matter of fact, however, this is not the case. A little readjusting of existing methods of accounting and a proper style of bookkeeping are the most important factors. Some extra work, of course, will be involved, but when it is balanced against the monetary value of the influence obtained in handling the working staff, and the experience secured in directing the use of capital, the advantage is greatly in favor of the extra expenditure.

Between the daily report and the yearly statement, a monthly review of conditions is extremely useful. Such a report should contain statistics for the month and totals covering the period since the last inventory was taken. In compiling an average cost sheet the principal object should be to secure compactness. A monthly statement necessarily covers a larger scope than a daily statement, and from it one can obtain a fairly definite idea of the state of business. Monthly totals may be dealt with in various ways. It is of much value, for instance, to show in table form the sales and expenses, condensing size as much as possible, while retaining all important information. The approximate profit to date should also be shown, and in this, more than any other feature of the reports, it is of the greatest importance to err on the side of conservatism.

Such departments as boarding and cook house, store, hotel, barn, etc., form a branch in themselves. Profit and loss statements in connection therewith must be regulated largely by the individual discretion of the accountant. The simplest and probably most effective way of dealing with these, is to prepare every month an inventory of supplies on hand. In the preparation of asset or liability accounts, tax payments, insurance premiums, and all other similar payments can not be placed on the expense sheet of the month in which they are made, but must be charged and transferred to their respective accounts in monthly instalments. The kernel of the whole report system is the monthly summary of per thousand feet cost, together with a condensed statement of liabilities and resources.

These are simply outlines of the generally accepted methods of systematizing business in lumber manufacturing concerns. The points to be pressed home are that such reports are absolutely necessary to successful business, that they are not to be overburdened with detail, and that they should include, on the other hand, all that will assist to give those who are responsible, a reliable may from which to plan systematically for future development.

A Good Time to Reform Trade Methods

The improvement in the lumber markets in all parts of Canada which has taken place during the last year has placed the industry in an excellent position for entering upon the season of 1911 with reasonable hope for a prosperous year's trade. With stocks of dry lumber smaller than they have been at this time of year, for many years past, and with the prospect of a very active year in the building trade, it looks as though there will be plenty of orders for everyone, and as if prices are likely to be satisfactory. Under such conditions and at this time of year when the old stock is disappearing and new stock is still in the woods in the form of logs, there is a matter which all manufacturers and dealers in lumber should give more attention than they have been accustomed to of late. This is the matter of selling tactics.

The opportunity for reforming selling methods was never better than it is to-day. Nothing is more characteristic of the lumber trade in Canada and in most other countries, too, than the fact that when trade shows the least indication of sluggishness there are many who quickly get cold feet and commence to make things worse by cutting prices. There is no more unreasonable idea than that trade can be stimulated during times of depression by cutting prices. The result more often than otherwise is to reduce trade, by persuading the buyers that further reductions are probable. Every lumber dealer knows this as well as he knows his name, yet when the test comes he is often found wanting. There is just so much demand for lumber during times of dull trade, and all the price cutting in the world will not improve matters. It may result in the securing of a particular order, but it also adds one more buyer to the list of those who have successfully beared the market and makes it that much more difficult to restore the market to its normal level.

Price cutting has many forms and perhaps the most insidious is that of sending out quotations which it is not the intention of the seller to accept. When faced with the accusation, there are very few who will admit having indulged in this practice and perhaps it is not often done with definite intent to deceive, yet there is little question that it is often practiced. A series of quotations are sometimes sent out, and when an order comes in for one of the special bargains on the list, it is refused and the would-be customer is informed that the stock has all been sold and told that the firm trusts they "may have further orders, etc." If the influence of such a course stopped right there, there would be no reason to object, but the evil is in the fact that this proceeding places an unfair price on the property of other dealers. A firm, moreover, should place some value on its ability to give prompt service. In fact, every time that a customer secures a cut rate or is deceived by a false quotation, the whole trade suffers and the firm which makes the cut in the price gets only a reputation with the customer of being a price cutter. What everyone in the trade should aim at is, first of all, a solid reputation for supplying good stock without delay, and, secondly, at doing all in their power to enable other dealers and manufacturers to acquire the same reputation. With a good demand for lumber and no threatened over-production, the time to-day is opportune for putting an end to many of the practices which have prevailed too frequently in the past.

Editorial Short Lengths for Busy Readers

The introduction of a bill by the Surveyor-General in the New Brunswick Legislature, to prevent the export of unmanufactured pulpwood from Crown lands, adds one more to the string of provinces which are determined to encourage the development of the pulp and paper industry in Canada. It is a fortunate thing for the people of Canada that so many of the provincial governments have decided upon this reasonable method of protecting their natural resources, before it is too late to save the forests from destruction in the interests of foreign industries.

Instructions have been issued from the office of the provincial timber inspector at Vancouver to the effect that in future the government timber royalty on railway ties will be 50 cents for 32. The old rate was one cent per tie, which was in force until the change in regulations was made at the recent session of the legislature. The royalty on hewn ties and sawn ties will be paid by the mill companies and the scale will be the board measure of the log. Timber on mineral claims cannot be sold but must be used for the development of the mineral claim on which it grows.

Perhaps there is no class of business men in the universe to whom the menace of fire means more than to the men in the lumber trade and industry; manufacturers and dealers, whether engaged in the trade on a great or a small scale, have always before them the possibility that they may at any hour be visited by the destroying element that has in a financial sense laid low so many firms and individuals who would, but for such circumstances, have achieved success and industrial importance. There is scarcely a yard or mill in the west but has been, at some time or other, in peril of destruction. Many severe lessons have been meted out to lumbermen; the history of the past decade includes stories of a number of great fires in which lumbering interests have figured prominently. The average lumber dealer is probably not given to speculation apart from that found in his own affairs. To remove as far as possible every source of uncertainty or of possibility of loss is the aim of the executive head of every industry. The condition of the lumber market is productive of great uncertainty, the danger of loss is always present to a greater extent perhaps than in many businesses. That is why it is necessary to shut off this avenue of loss by fire. It is rather remarkable that many men who would not think of taking money out of their business to speculate take long chances every day with the risk of fire. If they are in a position to stand a heavy loss then it may be wise to save premiums, but in cases where a loss means financial difficulty the firm or individual that has no insurance or too little is treading on thin ice. His business is not being built upon a sound foundation. A firm that is carrying a stock of lumber or that owns mills which are not insured because they cannot afford to pay the premiums cannot afford to own that stock or those mills.

The Edgewood Lumber Company, at Castlegar, B.C., have recently adopted a policy in connection with the housing of their employees which is meeting with general approval on the part of the men. They have done away with the old fashioned boarding house which has come to be a recognized part of the equipment of most mills, camps and mines, and are erecting in its stead a number of attractive three-room cottages. The rooms in each cottage are a sitting room and two bedrooms. They are comfortably and hygienically furnished. Two men live in each cottage. Twenty-tight of these buildings have already been erected. The men have their meals in a large hall built especially for the purpose.

Canadian Lumber in the West Indies

Increasing Quantities Sent to Barbados, Windward Islands, and Other Southern Ports—Valuable Information Regarding Sizes, Quantities, etc., in Government Report

The latest returns of wood importation into the West Indies show an increase—from £421,922 in 1908, the amount has risen to £460,947. More staves, shooks, puncheons, and shingles were imported, whereas of pitch pine the amount remained about the same. Of items not under any special class, or under the general head of lumber, there was a considerable increase. Part under this head was hemlock and spruce, which would bring up the amount imported in the latter class even with last year, though in the loose methods of preparing the returns a falling off is shown. It is probable the importation of Canadian lumber has remained the same for some years past, though the method of classifying shows occasional fluctuation.

The following statistics give the value of lumber imported into each colony:

Barbados, £97,260; Bermuda, £10,665; British Guiana, £57,207; Jamaica, £168,710; Trinidad, £54,866; Leeward Islands, £40,905; Grenada, £8,067; St. Lucia, £3,366; St. Vincent, £9,714; Bahamas, £10,187; total, £460,947.

The following statement shows the quantity of each variety imported, together with manufactured staves, puncheons and shingles. Under the general head of lumber the statistics from Trinidad include spruce, white and pitch pine:

Staves, shooks and packages	£124,940
Pitch pine	122,818
White pine and spruce	76,886
Shingles	25,784
Hoops	4,907
Lumber, not specified	91,880
Other kinds	13,732
	£460,947

From the foregoing statement it will be seen how important the two items of puncheons and staves are to the West Indies. Nearly all of this trade is obtained by the United States. In the case both of puncheons and staves, this is due to the fact that oak is believed to give the most satisfactory results, and that this wood can be procured in quantity only in the United States. Experiments, however, have demonstrated that birch wood can be successfully used. As the price of the stave made from Canadian birch is lower, it would justify the attempt to perfect such a stave, so that a puncheon equal to an oak one could be placed on the market.

Attention has been drawn to this matter on more than one occasion within the last two years. Some Canadian firms have evidently taken up the suggestion and have been finding a market for birch staves. The returns for 1906, previous to the matter being inquired into, showed the import of staves and shooks from Canada as amounting to £1,513, whereas, as a result of an effort in this direction, the latest returns show that this amount has risen to £5,093. As the volume of the trade is large, it would appear desirable for Canadian firms to make still further efforts in the direction of obtaining some of it with native hardwoods.

Dimensions of Staves.

The dimensions of staves have been given in earlier reports, but as the trade is an increasing one, and the oak stave tending to advance in price, it would seem desirable to repeat the figures so that any Canadian manufacturer interested may have a chance to compete.

Staves come in bundles sufficient in number to make one hogshead, about 30 to each bundle. The length is 44 inches, the width from 2¼ to 4¼ inches. They are cut square at the ends; the stock is one full inch in thickness. Thirty-six superficial feet of lumber are required to make the sides of a hogshead. The puncheon head is 28 inches in diameter, and the hogshead head 36 inches.

The staves do not require to be kiln dried, but should be weather dried for a short time. It is not essential that the staves should be bent, as this can be done here just as well. Any Canadian firm, however, intending to go extensively into the manufacture of staves should attempt to bend the wood, as the expense in so doing would be but small. The staves received from the United States are generally bent and ready for use.

Higher Grade Shingles.

The quantity of shingles imported annually amounts in value to about £20,000. Of this, about £13,000 is for spruce and cedar shingles from Canada, the balance being for cypress shingles from the United States and wallaba shingles from Demerara. The price of cypress and wallaba is much higher than the Canadian shingle, selling here for from $4 to $6 a thousand, or rather more than double the price of the Canadian. The wallaba is a split shingle, thicker and heavier in weight, and partly for these reasons has a certain demand in the market. The fact that more expensive shingles can find sale up to nearly £7,000 a year should be of interest to Canadian manufacturers, as no doubt advantage might be taken of it in using more expensive woods in the manufacture of shingles to compete with those made of cypress and wallaba.

Lumber Market in Barbados.

The requirements of the lumber market in Barbados should be of interest to Canadian lumber firms. The same conditions exist in the northern islands, some of which are now receiving part of their supply from this port. Shipments are received as a rule on consignment. On arrival the trade is notified and tenders invited. If the price offered is below the authorized minimum, the lumber is held and the shippers advised. These cargoes come generally from Nova Scotia and New Brunswick by sailing vessels. Only a small quantity comes by steamer.

To be merchantable, pine boards are required to be one inch in thickness, and of a width of from 6 to 10 inches, with not more than 1 inch of sap on one edge. A lower grade may have sap at both edges, but must not extend across the board, and spots must not go through. The dimensions should be the same as for best quality. Second quality boards may be narrower, down to 5 inches, but must have a clear face. All grades below are regarded as inferior. No planed boards are imported. Lumber should be stencilled as to contents, otherwise a charge for surveying will have to be met, as required by the customs. Cargoes of pine to obtain best returns should be one-third merchantable and two-thirds second quality. The demand for planks is small. The dimensions required are 2 inches by 7 inches. Specifications as to quality are the same as for boards. The sizes of scantlings used are 2 inches by 3 inches, and 2 inches by 6 inches, in 8-foot lengths and upwards.

Spruce is supplied to this market in three qualities—merchantable, second quality, and inferior. The thickness required is 1 inch, the width from 6 to 8 inches. Boards wider than 8 inches are accepted only in small lots. Second quality boards are sold at $4 under merchantable, and inferior $4 under second quality. Hemlock lumber is supplied in boards of the same thickness as spruce, running, however, rather wider. They are only supplied in merchantable grade.

Wharfage and Labor Charges.

The following will give some of the important items in the cost of landing lumber in Barbados. Wharf accommodation is only available for sailing vessels of small draught, and the harbor master's consent to land lumber must be obtained. A charge of 2½ cents per registered ton per day is made as wharfage dues for vessels loading or unloading alongside wharf. The stevedore is allowed for handling cargo the following rates:

White pine, per M., 10 cents; pitch pine, per M., 12½ cents; shingles in bundles, 5 cents; shingles, loose, per M., 5 cents; staves, loose, per M., 12 cents.

Model Cargo for Windward Islands.

Practically all the lumber imported into these islands from Canada is shipped from Nova Scotia ports. That arriving at St. Vincent is generally by Pickford & Black steamers, though occasionally a cargo comes by sailing vessel. A similar means of obtaining supplies is taken in St. Lucia, steamer transport being preferred on account of despatch. In Grenada, however, the cargoes are generally by schooner, and are from 200 M to 350 M superficial feet. The cargo which is preferred consists of 250 M shipping white pine, 50 M second quality, and 100 M cedar shingles, together with a few thousand feet spruce boards for boat building. This is recommended as a model cargo.

Complaints Concerning Canadian Lumber.

Advices from Grenada are that a difficulty is experienced in getting good quality Nova Scotia white pine. A surveyor's certificate is claimed to be no criterion, as cargoes vary. This uncertainty in regard to quality is contrasted with the pitch pine from the gulf ports, which is of standard quality, and never falls below it. Writing from St. Lucia, a merchant importing lumber states that Canadian firms do not buy and ship on commission as is done in the United States, but a profit is charged, which is objectionable. Freight rates rule higher than from New York, and the lumber from the United States is apparently of better quality, being full thickness and better sawn, though it is believed the lumber itself is Canadian. The charge for planing in New York is $1.50 per M. feet, whereas in Canada $3.50 is charged, the difference being a profit in itself. This statement it has not been possible to verify. The transactions in these islands are generally for cash, but as the merchants now engaged in the lumber trade are reported as being of good standing, it is pointed out that reasonable credit offered by Canadian firms would tend to make the trade expand.

Leeward Islands Lumber Trade.

Part of the lumber supply of these islands comes in sailing vessels from Barbados. The general directions as to consignments required in the Windward Islands apply here in the main. No Canadian scantling is imported, only pitch pine from the United States. It is claimed that it is cheaper. The sizes required are 2x2, 2x3, 2x4, 3x3, 3x4, 3x5, 4x4, 4x6. Tongued and grooved flooring of pitch pine is also imported. As the best quality spruce makes a good floor when properly dressed and grooved, a demand for this might be created to replace pitch pine, as it could be sold lower in price. An occasional shipment of lumber is sent from Canada by schooner on consignment, but the rule now obtaining of ordering in small lots by steamer to meet immediate demand is likely to be maintained.

A large quantity of white pine boards and planks is imported regularly from New York by steamer. This lumber is believed by the merchants to be of Canadian growth, but is cleaner, more uniform and cheaper than when imported from the maritime provinces.

Demerara Trade.

The lumber trade of Demerara is largely in local woods. White pine boards and planks of good quality are imported from Ontario and Quebec, through New York or Canadian ports. A lower grade comes from Nova Scotia. Very little spruce is imported. Specifications for boards call for 10 and 12-inch widths and 12 to 16 feet lengths, and for planks the standard width. The lumber is imported in the rough, as an extra duty is imposed when planed. Nova Scotia boards come in smaller sizes, down to 4 inches wide and in short lengths. No Canadian scantling is imported; that in use is of pitch pine. Arrivals are by steamers, but small lots occasionally come as deck loads on sailing vessels. Terms are generally shippers' draft at 10 days' sight.

White Pine and Spruce for Jamaica.

A correspondent writes that Canadian lumber imported consists only of white pine and spruce of ordinary dimensions. That the boards are of varying width and are in the rough. Pitch pine and spruce scantling are not in use. The terms of purchase are on a cash basis, and at present all Canadian lumber arriving is by steamer. He remarks that in previous years there was a considerable trade done in Canadian white pine and spruce, and cargoes were frequently imported by sailing vessels. In addition to these direct importations small lots arrived occasionally by fishing vessels occupying their deck space. Since the abandonment of the importation of fish in this way, most of the consignments arrive by steamer, and the market is usually bare of lumber consignments. There is but small demand for spruce lumber, but a considerable one for white pine, both rough and dressed.

It is believed that the white pine obtained from the United States is of Canadian origin, but the objection to importing direct from Canada is that a considerable quantity of narrow boards, ranging from 4 to 8 inches, are expected to be accepted. These do not suit the local trade, which demands a 12-inch board, and this is more easily obtained from the United States.

There are no special requirements as to quality or dimensions in regard to the lumber required in the Trinidad market. The importation from the United States and Canada is in white and pitch pine, spruce and hemlock. Rough and dressed boards are to be of 1-inch stock, and from 6 to 12 feet in length. No scantling is imported in spruce or white pine. Transport is by steamers and sailing vessels. The usual terms are cash against documents.

Opportunity for Increasing Canadian Lumber Trade.

On inquiry from the merchants in the West Indies as to their method of ordering lumber, it is found that it is generally done through commission men, some of whom are quite unfamiliar with the lumber trade. If experienced lumber dealers would occasionally make the rounds of these islands, or send representatives possessing the necessary knowledge, no doubt a larger amount of Canadian lumber would find a market in these colonies. A list of lumber importers is kept on file in their office at Bridgetown, Barbados, and can be supplied to any Canadian firm wishing to obtain it.

A lot of business was transacted at the annual meeting of the Province of Quebec Limit Holders' Association, which was held at the Chateau Frontenac, Quebec, on March 28th. There was a large attendance of members, and among the matters under consideration were the recommendations which the association will make to the Quebec Government in regard to a number of changes which the lumbermen desire. The election of officers resulted as follows: President, Alex. McLaurin; Vice-presidents, George Cahoon and W. H. Trower; Executive Committee, D. C. T. Atkinson, Donald Fraser, G. M. Stearns, Anderson, William Price, M.P., H. C. Foy, W. G. Powers, Carl Riordon, J. A. Rousseau and B. A. Scott; Secretary-treasurer, Paul G. Owen.

Canadian Timber in Leeds and Hull

Good Opportunities for Enlarging Trade in Birch, Oak, Maple and Other Woods—Demand for Wood Fibre

The lumber trade of Leeds and Hull, England, is dealt with at some length in a recent issue of the Dominion Government Trade and Commerce reports:

"Canadian timber has obtained a well-merited reputation among the merchants, sawmill owners and other users in this part of England," says the report. "The word 'timber' is used here in a two-fold sense; it refers to such trunks of trees as are suitable from their size and quality to be sawn into planks, and the planks so obtained are also called timber.

"Under the excellent system of canals which connect the chief cities and towns in this district with both the west and east seaboards of England and the facilities offered for water transport, Leeds has become an important centre for the consumption of timber amongst its numerous industries. The varieties of Canadian timber which are mostly used are pine, birch, elm, ash, oak, fir, maple and spruce. Owing, however, to the varied character of the industries, an outlet is found for almost all kinds of timber for some commercial use. The existence of several large saw, planing and moulding mills also adds to the general consumption, as do also various firms engaged in the cabinet, shopfitting, building and joinery trade and in the manufacture of packing cases, school furniture, bobbins, picture frames, hardwood blocks and flooring and sundry other wood goods.

Birch for Spool Making.

"In view of the important industry carried on in this part of England in the manufacture of spools and bobbins, there is a constant consumption of wood bars. The trade done in this direction is well worth the careful attention of Canadian exporters. White or yellow birch is regarded as the best wood for this purpose, as it dries quite white, although rock maple is also used to some extent. The bars should be uniformly sawn full up to size from clean sound timber, which should be free from heart, shakes or knots, and for purposes of shipping are made up into bundles of 20 and wrapped round with wire. The more general sizes in use are 24 to 54 inches long in multiples of 6 inches, the squares being as follows: 1-inch, 1¼-inch, 1⅜-inch, 1½-inch, 1¾-inch, 2-inch, rising to 3½ inches.

"In quoting offers for shipment, prices should be based per Petersburg standard of 165 cubic feet, c.i.f. Manchester or Liverpool, and accompanied by particulars as to the quantities in which shippers could guarantee regular delivery. The prices for these bars vary from time to time from 25 to 34 cents per cubic foot delivered.

Pine Freely Used.

"Pine is put to many uses in this district, especially in connection with the interior fittings of houses, such as doors, window frames and other woodwork. Pitch and red pine planks are also freely employed for the making of ships' decks on the northeast coast, the import of timber for this purpose reaching a considerable figure each year. A further use of pine in this district is for the making of broom handles, and for this trade regular purchases are made of pine squares of the following sizes:

48 inches by 1 inch by 1 inch.
50 inches by 1⅛ inch by 1⅛ inch.
50 inches by 1¼ inch by 1¼ inch.

"As the permanent ways of the various railways in this country are constantly being relaid at some point or other, a market is afforded to Canadian firms in a position to export suitable sleepers. Fir is the usual wood for this purpose. The following are some of the more general sizes of sleepers in use:

9 feet x 19 inches x 10 inches.
9 feet x 9 inches x 4½ inches.
8 feet x 8 inches x 4 inches
9 feet x 10 inches x 5 inches.
9 feet x 9 inches x 4½ inches.

Oak Boards for Interior Fittings.

"Oak is used for various purposes, chief among which is that for the making of interior fittings and furniture of public buildings, banks and similar purposes. Formerly it was used by carriage builders, but, with the decline of that industry, due to the increased use of motor power, the consumption in that direction has decreased. On the other hand, there is a fair demand on the part of manufacturers of mouldings for plain white and quartered oak boards 1-inch thick by 2½ to 4½ inches wide and in lengths of 10 and 12 feet. Although it is contended that in strength and durability imported oak does not come up to the standard of that grown in England, the supply of the latter is only small in proportion to the requirements of the market, and merchants therefore depend, to a large extent, upon supplies derived from abroad.

Maple Blocks for Rollers.

"In view of the important industry carried on in the making of clothes wringing machines, a good market is afforded to firms in Canada able to supply the necessary blocks for the rollers. Some of the best known English manufacturers engaged in this trade have their works in this district, and as two rollers are used in the making of each machine, a large amount of maple is consumed each year. The blocks are required either octagonally shaped or rough turned in the round, but in both cases unbored. They must be 'quarter cleft' and free from shakes, black marks or knots. The general sizes in use are:

26 inches long x 6½ inches diameter.
26 inches long x 5¾ inches diameter.
22 inches long x 6½ inches diameter.
22 inches long x 5¾ inches diameter.

"A few blocks are also used in the following sizes, these sizes forming a small portion of each shipment:

26 inches long x 4½ inches diameter.
26 inches long x 4 inches diameter.
22 inches long x 4½ inches diameter.
22 inches long x 4 inches diameter.

"These maple blocks are usually received into this district between the months of October and June, and for this period buyers make arrangements beforehand for purchase

Wood Fibre and Pulp Boards.

"Included among the products of wood for which there is a market locally are wood fibre and wood pulp boards. Wood fibre, which finds an outlet for various commercial purposes, is at present obtained from Sweden and also from certain sources in this country. This fibre is supplied to users packed in bales of 1 cwt. (112 pounds) and quoted in lots of 5 tons. As a variety of grades are used, it is hardly necessary to say that samples of the fibre offered for shipment form an indispensible precedent to securing business. In regard to wood pulp, it may be mentioned that the import of this product is largely in the hands of importers situated at Manchester and London. In this particular district, however, an active trade is done in wood pulp boards of the following sizes, in inches: 22 x 32, 20 x 30, 20 x 25, 24 x 38, 25 x 40, 28 x 40, 30 x 40.

At the present time these boards are obtained from Scandinavia and Finland, but there is no reason why Canadian manufacturers should not be able to bring themselves into evidence in supplying these goods."

Floating Birch Logs on Long Drive

Difficulties Which Render the Operation Risky—Excessive Loss Almost a Certainty—Opinions of Operators

A reader of the CANADA LUMBERMAN who wishes to cut and float a quantity of birch logs writes for information regarding the possibility of getting the logs to the mill by water. In his letter he says: "We have a limit with about a couple of million feet of nice birch logs. It is too far from the railway, but is right on the river. To drive these logs means a drive lasting from May 1st to the latter part of July, and many of these would sink coming down."

With a view to securing the benefit of the experience of those who have attempted to float timber of this nature, the CANADA LUMBERMAN has addressed letters to a number of prominent operators asking for their views on the question. The replies received, so far, are as follows:

Believes it Almost Impractical.

Editor "Canada Lumberman":—In reference to floating hardwood timber, any considerable distance down driving streams, would say that we believe this almost impracticable, more especially if the logs would have to be driven or floated through some slack or dead water, as it is our experience that a great many of the choicest logs would sink, and if in deep water, of course be lost. If the logs could be peeled and left lying on skids where they would dry, the larger percentage of them would float all right, but if this were attempted the value of the timber would very much depreciate on account of the outside of the logs drying and checking and the timber doting and rotting. Hardwood to make the most of it and the best lumber, must be cut from the stump and sawed into lumber within a few weeks or months at most, when cut during the spring or early Summer months. When cut during the winter or fall, it should be sawed up by the middle of the following summer. We find beech, birch and maple to be very much alike in reference to floating. Some of the other varieties of hardwood will float somewhat better. We have had a great deal of practical experience with hardwood, as we handle it all through our ponds here at our Pennsylvania mills, and know that fully 15 to 20 per cent. of it sinks as soon as it is rolled off the skids into the water, and at least 10 or 15 per cent. more of it will sink after it has been in the pond two or three weeks. We have to have our booms so arranged that we can keep these sinkers gathered up and out of the way every few days. If we did not, our ponds would soon be entirely blockaded with sunken timber.

Yours very truly, Emporium Lumber Company, Keating Summit, Pa.

Loss Slight on a Short Drive.

Editor "Canada Lumberman":—Three years ago, in the month of June, we made several hundred birch logs and peeled them. We left these logs on the ground until September and piled them when making and piling spruce logs. The following spring we drove them to our mill, a distance of about eight miles. The loss in driving was 1½ per cent. The lumber sawn from these logs turned out fully as good as that sawn from logs which had been hauled direct to the mill during the winter. Last May and June we made and peeled one and a half million feet of birch. We piled these logs in October and November and during the winter we hauled them to the Boule river and put them in rollways on the bank. This spring we will drive them to the mill, about eight miles, and do not anticipate that we will have any greater loss than we did three years ago. Our basswood we haul direct to our mills and saw them without being watered, but occasionally a few go into the water and are driven down the Rouge River to our mills at Calumet, where they are sawn up before the water gets warm. The lumber from basswood logs left in the water and sawn in the summer is liable to stain. Every year ye drive considerable ash down the Rouge, some of it for a distance of fifty miles, with very little loss from logs sinking, and the lumber sawn from these logs is as good as the lumber from logs hauled direct to the mill. Yours truly, the Riordon Paper Company, Limited, Montreal, Que.

Floating Hardwood One Season.

Editor "Canada Lumberman":—The floating of hardwood timber is a matter about which there is quite a difference of opinion. There have been a great many different ways, and means taken, to float hardwood, but we think the only and successful way to do it, is to have it cut into logs during, say, the months of June and July, peeled and piled on skids say a foot or more from the ground, so as to avoid moisture, left there until the following spring, and then it can be floated for at least one season. If kept in the water any longer time than that, it is liable to sink. Yours truly, The E. B. Eddy Company, Limited, Hull, P.Q.

Thinks it is Not Feasible.

Editor "Canada Lumberman":—The only so-called hardwood we attempt to float is ash, elm, basswood and butternut. We do not consider it feasible to float, by means of attaching pine logs to hardwoods, birch, maple or oak, on streams such as the Ottawa or Gatineau, where falls and rapids are numerous and liable to part the "buoy" from the hardwood stock. The risk is too great, and it could not be a success. In water free of rapids we fancy there need be no difficulty. Yours truly, Gilmour & Hughson, Limited, Hull, P.Q.

Lost Twenty-Seven Per Cent. in One Day.

Editor "Canada Lumberman":—We experimented with the floating of hardwood timber a few years ago. We had about eight thousand feet of nice smooth birch cut in the month of June and peeled, and in the following winter we had the timber cut into saw logs. We hauled them to the lake and piled them on the bank, allowing them to lie there until the following spring. We then rolled them into the lake, and within 24 hours had them cut into lumber. We kept a close tally of the number of logs, and in that short space of time we lost 27 per cent. of the quantity, and had we delayed, say another 48 hours, we believe that 75 per cent. of them would have gone to the bottom. We have never since then attempted to float birch logs.

We met a party a short time ago and he told us that a few years ago he took out six thousand pieces of birch, cutting the trees in June and peeling them and floating them the following spring, and his experience was that he lost 25 per cent. of them. Yours truly, Huntsville Lumber Company, Limited.

Important Development at Revelstoke

A despatch from Revelstoke, B.C., says: Followinga recent heavy investment of British capital approximating two million dollars, in timber and sawmill plants in Revelstoke district, brought about by Messrs. Alex McRae, Thomas Kilpatrick and G. S. McCarter, prominent residents of Revelstoke, plans are formulating through a group of American and Canadian capitalists for the exploitation of the water power, pulp wood and timber resources of the district on a large scale. The initial investment of the syndicate involves the erection of a sawmill at Big Eddy, on the Columbia river, about one mile west of the city. The mill will have a capacity of two hundred thousand feet per day and will be the largest plant of its kind in the interior of British Columbia. Over 500 miles of timber and pulp wood in Columbia valley have been secured for the purposes of the enterprise. Construction work on the new mill will be started as soon as the snow is off the ground.

The manufacture of lumber is only one part of the syndicate's programme. The installation of a pulp and paper mill capable of turning out 200 tons of product per day is held in immediate contemplation and the erection of this plant will be undertaken when the necessary preliminaries are completed. It has been known for some time that there is a practically inexhaustible supply of pulp wood near Revelstoke and the adaptability of the location as a site for a pulp and paper manufactory has ben obvious to men acquainted with the resources of the city and district.

The power for these establishments will be derived from the rapids of the Columbia river, about three miles north of the city, where a power plant will be installed.

The pulp mill will be located close to the power plant and power will be available for the sawmill and other enterprises which the syndicate hold in view.

Mr. Barnum, who is acting as secretary to the company, is secretary also of the Diamond Mill Company, and a well known engineer. The land purchased for development covers something like 500 square miles, on which it is computed there is something like 8,000,000 feet of timber. This will be used to supply the lumber and pulp mills. The making of paper is to be one of the staple industries of the company, and a sash and door factory will be established. Work will be started on construction as soon as the necessary arrangements are made.

Cultivating Logged-Off Lands

The Canyon City Lumber Company have started clearing logged-off land, on their ample limits in the vicinity of Creston, B.C. The limits comprise 400 acres on the Creston side of the creek and 8,700 acres on the opposite side, and it is the intention of Mr. C. O. Rodgers, president of the company, to clear a minimum of 100 acres of logged-off lands this season, and as much more as possible. A $4,000 stumping machine is employed, which requires five men to operate, this doing the stumping and piling, while 15 other men are employed on the other work. As great headway with the work as possible will be made before May 15, when the close season for fires begins. All this cleared land will be plowed this coming fall.

A year ago the company adopted the policy of converting its logged-off land to agricultural uses. They cleared a substantial tract last season. That land will be planted this season to clover, and this crop will be plowed under. The land will be scientifically prepared, and the season following will be set out to fruit. When they subdivide the young orchard into tracts for sale, they expect to make contracts which require them to look after the tracts till the orchards come into bearing. Proceeding on this plan from year to year, they will finally have converted into orchard a large acreage of the finest fruit land in the Kootenay. In all, it is estimated that there are 40,000 acres of arable land in the Creston district, not including either the flooded areas or the mountain slopes.

The sawmill of the Canyon City Lumber Company, at Canyon City, has a capacity of 40,000 feet per day of 10 hours, and operates all the year round. The cut of the present year will probably be between 10,000,000 and 12,000,000 feet. Mr. Rodgers is about to put in improvements that will cost from $6,000 to $7,000.

British Columbia's Foreign Shipments Increase

British Columbia's foreign shipments of lumber during 1910 showed a considerable decrease as compared with 1909. The principal decreases were to China, Europe, South America and California. Substantial increases were made in the exports to South Africa and Australia. Following are the details:

	1910 Lumber ft.	1909 Lumber ft.	Gain orloss Lumber ft.
Australia	34,254,050	27,703,054	+6,550,996
South America	11,274,012	13,538,112	—2,264,100
Europe	3,052,686	8,044,921	—4,992,235
South Africa	12,597,770	4,344,815	+8,252,955
Japan	1,430,665	1,450,174	— 19,509
China	1,518,064	8,433,306	—6,915,242
California	71,870	1,638,855	—1,566,985
Fiji Islands	1,349,485	1,338,711	+ 10,774
New Zealand	608,781	2,622,386	—2,013,605
Mexico	1,379,556	2,628,978	—1,249,422
Alaska	....	811,725	— 811,725
New Caledonia	....	1,337,237	—1,337,237
Samoa	....	184,252	— 184,252
India	....	18,000	— 18,000
Totals	67,536,939	74,094,526	—6,228,662

Trade Revival in British Columbia

A special meeting of the Mountain Lumber Manufacturers' Association was held at Cranbrook, B.C., recently for the purpose of discussing market conditions. The following report was issued at the conclusion of the meeting:

"Owing to the severe winter, business was slow in opening up this year and the heavy snowfall had prevented the movement of lumber. However, in the past ten days there has been a marked revival, substantial orders were pouring in to all the mills and everything points to steady shipments for some time to come. If present indications count for anything the mountain lumbermen feel that they have prospects of the best year in the history of the Association before them. All the large towns throughout the prairie provinces promise to substantially increase their building permits over 1910, and from all information re immigration obtainable there promises to be a vast influx of settlers, particularly from the United States. A large amount of railroad extension is anounced, which will materially increase the market for lumber through the opening up of new territory. Whilst it is too early to forecast crop conditions, still the fact that there was more snow on the prairies than for many years is regarded as a very favorable sign. Another matter discussed was a proposal from the Retailers' Association, advocating a uniform standard of manufactured sizes and patterns of lumber, as well as of sashes and doors and mill work of all kinds, on the part of all the mills of western Canada, from Rainy River to the Pacific coast. The B. C. mills (coast and mountain) have already adopted a uniform scale, and it is proposed to induce the spruce and pine mills of Alberta, Saskatchewan, Manitoba and Ontario to follow suit.

"The constant problem of adequate car supply was also up for discussion. After prolonged consideration a plan was adopted whereby all the mills will report to the secretary, within the next few days, as to their requirements and he will take the matter up directly with the railroads concerned."

John Marshall, a pioneer lumbermen and contractor of Leeds county, Ont., died at Brockville on March 20, in his 93rd year.

Sudden Death of Mr. G. B. Greene Sr.

Manager of Upper Ottawa Improvement Company Succumbs to Heart Failure—Had Gone South for His Health

The late G. B. Greene, Ottawa

A man prominent in the lumber industry of the Ottawa Valley passed away with the death of G. B. Greene, Sr., which occurred in Richmond, Virginia, on March 28. Since about 1875, Mr. Greene had been secretary-treasurer and indeed manager and superintendent as well, of the Upper Ottawa Improvement Company, Limited, and remained in that position until his death. The late Mr. Greene was a life-long resident of Ottawa and gave many years of service to the city, both as an alderman and as a member of the collegiate institute board.

Previous to 1863 each mill owner brought his own logs down the Ottawa river, and the result was that gang followed gang over the same ground within a very few days of each other, the net result of the work being little over what could have been accomplished by one gang, if it had control of all the logs. In 1863 the Upper Ottawa Drive Association was formed to take charge of all the logs coming into the Des Joachims boom to convey them to their respective owners. This was merely a combination of the principal mill owners, who agreed to pay the cost in proportion to the number of logs belonging to each. For the first year the Association was not very successful and the tail of the drive never got in at all. The next year it was more successful and in 1868 a Dominion charter was obtained for the Upper Ottawa Improvement Company, which took over this work and acquired and built improvements for the lumber industry along the river.

Mr. Greene first entered the lumbering business when 17 years of age, measuring lumber for A. H. Baldwin. Soon afterwards he entered the new company and succeeded David Scott as secretary-treasurer. When he came into the company it did the booming and driving from Des Joachims to the Chaudiere, but the towing was sublet. The total number of logs coming down was small as compared with the number now. Various firms took the contracts for towing the logs on the different lakes, including the Union Forwarding Company, Capt. Murphy, Capt. Goulet, and the Upper Ottawa Steamboat Company.

In 1888 the Upper Ottawa Improvement Company decided to take over the towing between Des Joachims and Ottawa. The boats, which, of course, were of no more use to their owners since they could hardly be taken from the lakes in which they were built, were purchased by the company at $160,000. Since then the company has acquired the towing in Lake Temiskaming, which was formerly carried on by the Lumsden Company. It now does the driving, booming and towing from Lake Temiskaming to Ottawa. The company employs over 1,000 men during the summer, and has 20 boats. The great amount of work done is emphasized by the fact that nearly all the logs for the entire lumber industry of the Ottawa valley comes under its control.

During all its years of growth and extension Mr. Greene was the company as far as the management of the business was concerned. The shareholders are for the most part mill owners themselves, and so are the directors. Mr. Greene conducted all the extended operations so smoothly that the lumbermen were well satisfied and paid little attention to the management of the company. In managing this business Mr. Greene was much "up river" and was widely known throughout its entire length. He took a keen interest in the welfare of his employes and was very approachable to any or all of them.

Mr. Geene served under nine directors of the company who have passed away. They were A. H. Baldwin, F. H. Bronson, W. G. Perley, Capt. Levi Young, Hon. John Hamilton, Alexander Fraser, Gordon B. Pattee, E. B. Eddy and James Gordon. J. R. Booth and Hiram Robinson, the present president of the company, are the only survivors.

Mr. Greene was taken ill with typhoid this winter and had recovered from this disease when he left for Virginia for a rest. There his death came suddenly and unexpectedly of heart failure. He was 59 years of age.

Mr. Greene will be succeeded by Mr. P. W. Tomkins as superintendent and Mr. E. C. Woolsey as secretary-treasurer. Both have been in the company for several years.

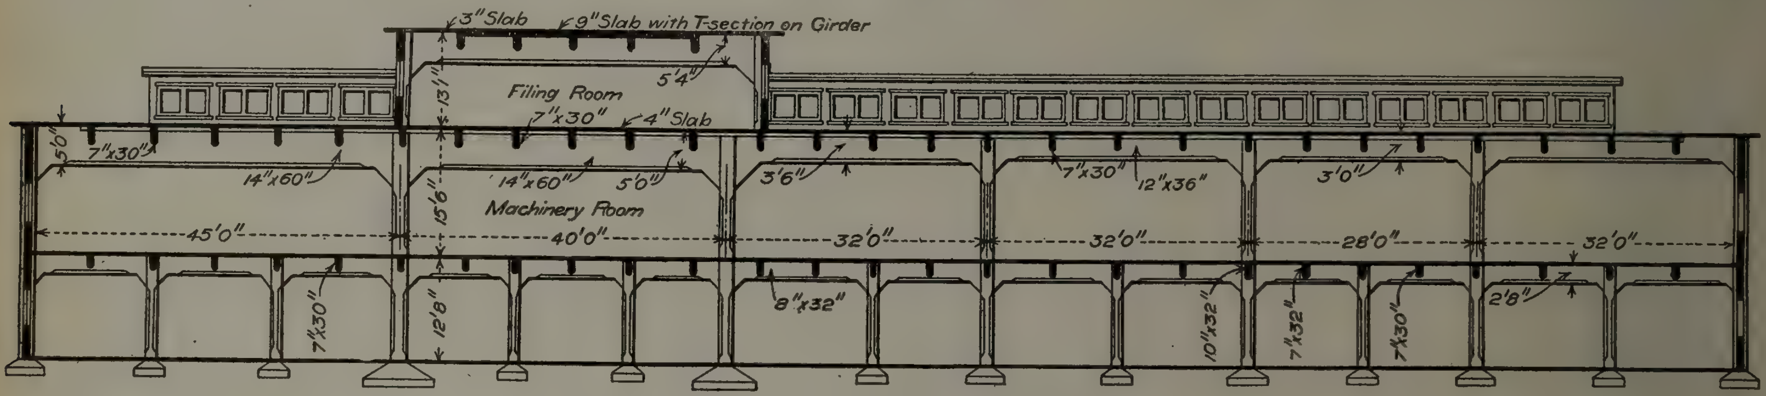
A Sawmill of Reinforced Concrete

Details of Construction of Plant Designed to Resist Fire—Sectional Drawings to Illustrate Lay Out of Departments

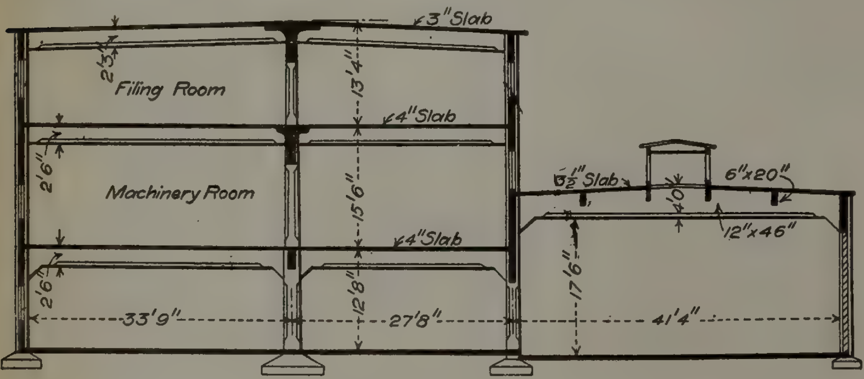
The use of concrete in the construction of retail lumber yard buildings is a fairly common matter nowadays, but there are not many instances in which reinforced concrete has ben used in the erection of a sawmill. At Sheffield, Pa., the Central Pennsylvania Lumber Company recently erected a sawmill of reinforced concrete which is, on this account, of much interest to lumbermen. The primary reason for the use of reinforced concrete was the desire to avoid loss by fire. Statistics gathered by the company indicated that the average life of a sawmill constructed of timber was about seven years before it is destroyed by fire. The supply of timber available in that district would last for fourteen years, and the company were therefore keenly interested in the use of fireproof material.

The plant consists of a main building 211 feet long by 62 feet 9 inches wide; a lath mill, 46 feet long by 28 feet wide, and a power house 72 feet long by 42 feet wide. The main building, as shown in the accompanying sectional drawing, is a three-floor structure, the ground floor being used for storage, with a machinery room on the second floor, where all sawing is done, and a filing room on the third floor. The lath mill is a two-storey building, and the power house is a single-storey structure. The capacity of the mill is 165,000 feet of lumber per day. It was built in about four months.

The features of the building are the exclusive use of reinforced concrete in all parts and the use of long span construction, enabling full-length logs to pass across the mill for distribution to the various saws. The log bench is of reinforced concrete construction and is designed to permit rough handling of the timber as it is delivered to the carriage. The sawing is entirely done on the second floor to give the maximum storage facilities below, the boards being dropped through to the ground level after sawing. The girder depth on interior spans is 5 feet, with bracketing at both ends. The larger spans of beams are 30 inches deep The main girder spans are 32 feet long, but the girder spans on the ends of the building are 40 and 45 feet long. The beam spans on one side are 27 feet 8 inches long and on the other 33 feet 9 inches in length. To obtain light, a monitor skylight was used, cutting the slab of the main beam construction.



Longitudinal Section Through Sawmill.



Transverse Section Through Sawmill.

In order to obtain sufficient compression on girders and beams a T-section was used, enabling a very thin slab to be employed without difficulty. Deformed bars were used in the reinforcement of slabs and columns. The footings were spread and similarly reinforced. The reinforcement of the beams and girders was entirely with the fabricated bar construction. The walls, acting as deep lintel beams, were reinforced with fabricated frames in which the shear members were rigidly attached, forming a wall reinforcement in addition to their resistive functions in the beams. The stresses assumed were 16,000 pounds per square inch in the steel and 500 pounds per square inch in the concrete on cross bending, the relative moduli of elasticity being taken at 15. In the design the general uniform loading required was light, estimated at not over 50 pounds per square foot. The effect of a log falling upon the carriage or from a crane upon the floor was cared for by the use of columns spaced from 14 to 16 feet apart in the lower storey of the main mill in place of the larger spans which were used to carry the floor of the upper storey. The roof of the plant is of tar and gravel, the spans in the power house being 41 feet 4 inches long in the cases of the beams.

Personal and General Lumber News

George D. Mackay, forest ranger, has been appointed chief timber inspector at Vancouver in the stead of Andrew Haslam, who has resigned. Robert Hamilton, Vancouver, succeeds Mr. Haslam as chief log-scaler.

W. W. Fraser, a well known lumberman of Winnipeg, has returned from London, Eng., accompanied by his son, Allan. He reports that the reciprocity discussions have not only advertised Canada in the United States and Great Britain, but over the whole of Europe.

Mr. W. B. Bartram, of Bartram Brothers, Limited, Ottawa, will leave for New York on April 19th, to visit the New York office of the firm. He will also call upon the firm's customers in New York, Pennsylvania, Connecticut and Massachusetts.

The business office of the Mountain Lumbermen's Association of British Columbia is to be moved from Nelson, B.C., to Calgary, Alta. Mr. W. A. Anstie, secretary of the Association, in referring to the change, states that the object is to get into closer touch with the markets to which the members of the Association cater. Although the business office will be at Calgary, the titular head office of the Association will continue at Nelson. Mr. Anstie states that the outlook for business during 1911 is better than it has ever been on the prairies.

Mr. John R. Booth, of Ottawa, the king of the lumber trade of Canada, celebrated his eighty-fifth birthday on Wednesday, April 5th by doing a full day's work as usual, and by arriving at his office bright and early in the morning, at an hour when most of the business men of Ottawa were at their breakfasts.

Mr. John Carew, the well known lumberman of Lindsay, started his sawmill on the 3rd inst. This is the earliest in many years that he has commenced operations, but anticipating a big seasons' cut he decided to start early. His sawmill has been completely overhauled since last year, many additions having been made, including a new carriage of Madison Williams manufacture.

Mr. Norman Playfair, of Midland, met with a serious accident about the end of March which for a time gave his friends a great deal of anxiety about his recovery. He was enjoying a sail on an iceboat and met with an accident which resulted in his being badly cut and bruised about the head. He was unconscious for about nine hours. Latest reports are to the effect that he is recovering satisfactorily.

New subscriptions to the Death Emergency Fund of the Concatenated Order of Hoo-Hoo are now due, the date of the second call, which was announced in the last issue of the "Canada Lumberman," having been fixed at April 6th. A prompt response to the call is hoped for, so that the administration of the fund can go along without interruption.

A new use for hemlock will open up if the claim is substantiated that that wood can withstand the attack of teredo. The United States government engineer at Aberdeen, Wash., states that it has been necessary to replace fir piling which has been in the water but one year, while hemlock put down at the same time is as sound as when first driven.

The lumbering industry of Canada will be made the subject of a special issue of the London Times to be published on Empire Day. Mr. H. Perry Robinson, a well known member of the Times staff, is at present in Canada gathering material for the issue. He will visit all parts of the country and make an exhaustive study of conditions, at mill points, in the woods and in the large consuming and shipping centres.

CAMP DEPARTMENT

Forest Protection

W. C. J. Hall

There are many things to do in order to protect the forests, and I cite in this paper what occurs to me as being practicable in our own country, I hope applicable in a great measure in others, and generally tending to reduce the fire risk.

1. All territory outside of the settlements, which is mountainous, rugged, and unsuited for profitable agriculture, carrying less than 50 per cent. of arable soil, should be erectet into permanent forest reserves and strictly maintained as timber growers

2. All shanty roads existing in timber lands, and small bridges, should be maintained by the fire rangers in such a condition as will permit of them being used by men on horseback. They thus form excellent fire breaks in case of an emergency and permit of rangers moving about freely.

3. Lookout stations should be established on prominent elevations in rear of the settlements, connected by telephone with points from which assistance can be summoned at short notice. The telephone can be used alone to connect distant points on timber lands. We have had proof of the efficiency of both systems.

4. Where roads do not exist, and lookout stations and telephones are not practicable, experienced men, with a knowledge of the district, should be employed to patrol the forests, rivers, and along the lakes. Every portage should be placarded, whether on a river or between lakes, warning the transient sportsmen, prospectors, or others, against leaving their camp fires or smudges unextinguished.

5. Owners or lessees of timber lands should give special attention to camp fires on the drives. The large open fire necessary whilst this work is going on cannot be thoroughly extinguished with half a dozen pailfuls of water, one man in each gang should be deputed to attend to this and made responsible for seeing that these fires are completely and effectually drenched and snuffed out beyond any peradventure. If time permits, the fire should have a trench dug around it to secure its not getting away.

6. On railways running through or near forests, the ditch on each side should be on the extreme outside edge of the right of way. So situated, it constitutes a splendid firebreak. The companies should be obliged to place experienced men on all the steep grades, equipped with speeders, so that by following trains, incipient fires which may develop into conflagrations can be handled, controlled and extinguished, without summoning a force, i.e., nipped in the bud.

The companies should have every engine properly netted, the overflow from the injector conducted into the ash-pit, the windows on all smoking cars wire-screened, every engine inspected on reaching a terminal point, and allow no shaking of grates or emptying of ash-pans between stations.

7. When construction is going on, special supervision is necessary. There should be a ranger on patrol every four or five miles, and even then he will have his hands full. If he can patrol on horeback he can look after ten or twelve miles. The contractors should be made and held responsible for any fire originating on the right of way and which extends into and damages any forest adjoining same. Their men should be at the command of the ranger whenever fire is observed on or off the right of way. The burning of the debris, cut-down timber, branches, etc., on the middle of the right of way, should only be permitted under direct supervision of the ranger, and only at such times as, in his opinion, it is safe to do so. All trees should be felled towards the centre of the right of way, and no debris left on the fringe of the forest.

The railway fire ranger should be doubly alert on Sundays and public holidays, when the men are idle, and perhaps roaming here and there through the forests.

8. The border line between civilization and the forest is where a majority of serious fires originate. The settler should be compelled, under a severe penalty, to pile his slash in heaps and rows and burn only one heap or row at a time, and this to be the one to leeward; he can thus control his fire. This danger zone should be patrolled by the most experienced men obtainable, and an inspector should visit the localities frequently. If weather permits, in prohibited season, a settler might be allowed to burn his slash, under personal supervision of the district ranger; again, in the open season rangers should be empowered to forbid burning when there is a drought.

No mineral prospecting party should be allowed to operate without being specially warned to extinguish their camp fires. and to take every precaution against forest fires.

Small mills, near or in forests, should have their smoke stacks equipped with bonnets, such as will satisfy the demands of the Underwriters' Association.

Colonization or municipal road construction through the forests should be carefully supervised; the debris if thrown on either side creates a splendid fire trap, it should be piled up and burned on the middle of the newly constructed road, under careful supervision.

Municipalities near or adjecent to forests should be compelled to interest themselves in the subject of protection of the forests, as any resident therein, burning a slash and not taking precautions, may be the means of wiping out the whole settlement; instances of this kind can be called to mind. Some competent reliable man should be employed to patrol in spring and fall, and in times of drought visit every clearing, and when it is safe to burn, summon the nearest fire ranger to supervise the burning.

9. Every fire ranger should carry an axe, canvas bucket, and a steel shovel; a man thus equipped can do some fire fighting. He should write up his diary every day carefully, and at beginning of each month send in his report for the previous month's work. Details of every fire, however small, should be given in his report. The ranger should prepare himself for emergencies and arrange in some way to be in a position to summon assistance when he has a fire to contend with which is beyond the power of one man to control. In spare time he should clear the roads of wind falls, and mend the bridges whenever a weak spot declares itself, and post himself thoroughly as to the location of all rivers, lakes, burns, etc., and indicate them on the map supplied him by his employers. As frequently as possible he should ascend the prominent elevations so as to secure an extensive view, he should blaze trails through any unbroken forest on his beat, so that he can quickly reach any desired point if smoke is observed.

In remote sections, rangers should work in couples, an experienced man with a novice. For this work a canoe, tent and small outfit are necessary of course; they must arrange to supply themselves with provisions in greater or lesser quantity, according to the distance their section is from the base of supplies. These are the men likely to meet with the transient and reckless sportsman, the mining prospector and others, who really need to be seriously cautioned, and sometimes followed up. The members of an organized fish and game club will rarely, if ever, be found lacking in taking proper precautions, as if fire devastates their territory it at once becomes valueless to them—this is our experience with these organizations.

Rangers should, where they have to deal with settlers, act with diplomacy, tact, and firmness; the bona fide settler knows his own interests pretty well, and will be found ready to listen to advice, but the man who, under pretence of tilling the soil, is exploiting the timber, needs to be handled without gloves.

All rangers should be on the alert to observe the workings of injurious insects, and when noticed, gather specimens and send them in to headquarters with remarks. They should report any one they find killing insectivorous birds, either in or outside the forests.

Fighting Fire.

A ranger just coming over the crest of a hill notices smoke some distance away, and below him, he hastens with all speed to the spot and arrives there in, say, 15 or 20 minutes. The fire has been set apparently by someone dropping a glowing match, or the ashes of a pipe, has spread and is running; a formidable proposition confronts him; he decides that he can conquer it single-handed and, there being no water close at hand, gets to work with his steel shovel at once. He makes his attach on the leeward side, throwing every shovelful of dirt towards the fire, and as there is a trail near at hand in which the fire is working, he endeavors to edge the fire diagonally towards this trail, knowing that is he can succeed in this he will be in a fair match for his enemy. The ranger succeeds in his effort, and by the time the fire has reached the road it has been considerably narrowed, and finding nothing to consume there, dies down. The ranger then attacks the windward side, and, being unencumbered by smoke, makes short work of that; he then goes into the forest on the other side of the road and looks for live embers, or any other signs of fire, finds some and snuffs them out, and returns to his attack on the main fire. He works all round, to leeward tnd windward, and does not relax his efforts until he is complete master of the situation. But there is still fire in some old stumps, and windfalls. The former he brings down with his axe, and then with his shovel smothers them and the smouldering windfalls out. The ranger stays the night on the spot, goes carefully over the ground in the morning, satisfies himself that no fire exists, and then continues his patrol in other parts.

The above is a brief description of a small fire, which an experienced man can tackle and extinguish alone. There is nothing to equal what can be done with a shovel, it does double work, every shovelful of dirt counts as two, i.e., the hole made by digging, and the surface covered by the soil or sand when thrown towards the fire, with a sweeping motion, just in front of the digging

---

*Extract from an address delivered at the recent Dominion Forestry Convention at Quebec.

THE WOODWORKER

Kinks In Woodwoorking Costs

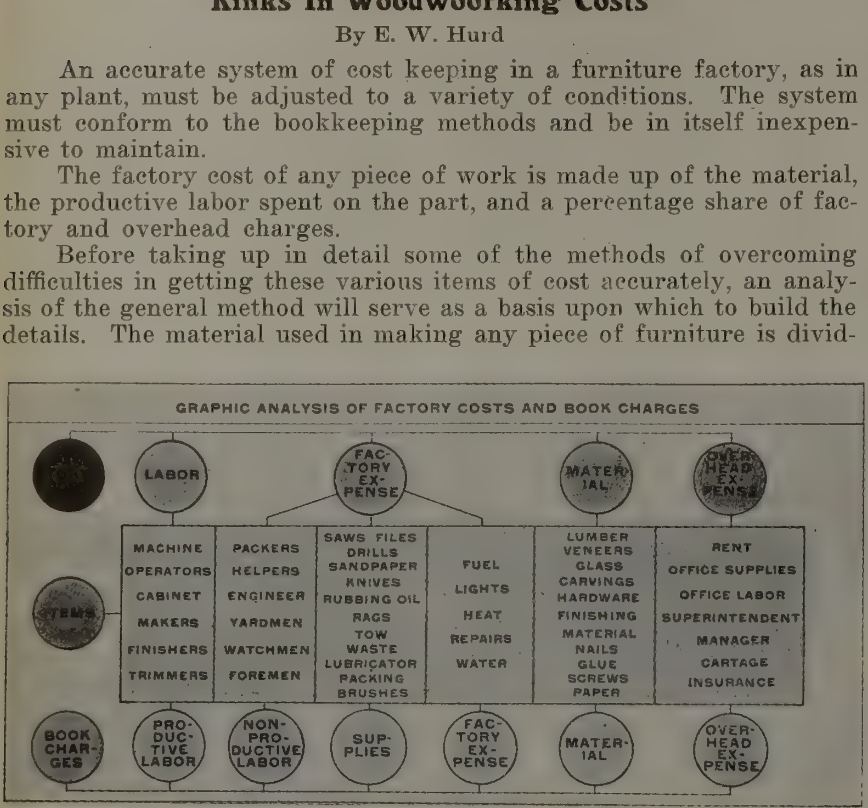
By E. W. Hurd

An accurate system of cost keeping in a furniture factory, as in any plant, must be adjusted to a variety of conditions. The system must conform to the bookkeeping methods and be in itself inexpensive to maintain.

The factory cost of any piece of work is made up of the material, the productive labor spent on the part, and a percentage share of factory and overhead charges.

Before taking up in detail some of the methods of overcoming difficulties in getting these various items of cost accurately, an analysis of the general method will serve as a basis upon which to build the details. The material used in making any piece of furniture is divided under two general heads: lumber, the cost of which is figured from the cutter's bill of material with a percentage added for waste; and all other materials, veneers, hardware, glass mirrors, and so on, which are purchased and the cost of which is taken directly from the invoice.

Labor, the second item of cost, is divided under two heads, as chart I. shows, productive and none-productive. Time cards are used to get the exact time used by each man on every operation; the summary of the time cards gives the productive labor cost. Non-productive labor is taken from the pay roll records and is apportioned as a separate, individual percentage or as a portion of factory expense. The latter treatment is more usual as is shown in the chart; but as our cost summary (form I.) indicate, we have found it advisable to apportion the non-productive labor percentage individually on the cost of each job. This non-producing labor cost is applied as a percentage of the productive labor cost. The ratio is the average of the ratio of non-productive to productive expense for several months. In figuring the cost of new work the non-productive expense is figured as a percentage of the productive expenses.



Graphic Analysis of Factory Costs and Book Charges

The other two items of factory and overhead charges may also be applied as percentages of labor cost. In our plant, supplies, factory expense and overhead, divided as shown in the chart, are applied as individual percentages of productive labor cost plus material costs for a year. As the chart indicates, however, non-productive labor, supplies and the items under factory expense can be applied as one percentage. In many lines of manufacturing this will eliminate considerable detail. It is essential that these percentages be obtained from average bookkeeping charges over considerable periods, preferably a year.

Form II., Showing Cost Summary

In following out these general cost divisions, many points have come up in my work which have required special treatment. The finding of the labor cost in a woodworking plant presents several difficulties.

Labor must be divided on the pay roll into productive and non-productive departments, so that the percentage of one to the other is available at all times. Productive labor, as the chart shows, includes the work of all machine operators, cabinet makers, finishers and trimmers.

The labor of stock cutters and rippers must be classed in the non-productive column because it is impracticable to apportion their time for jobs.

For keeping time of the productive time on jobs, I have found a simple time card (form II.) identified by order number and clock number very satisfactory. A supply of these cards is kept in each department, and every producer fills out one for each operation during the day except the item "rate per hour." which is added in the office. We check the total time one man puts in a day on different jobs against his clock record for that day. The average workman will neglect to include the time spent in setting his machine for an operation and, as a result, the labor cost on the article may run low. The loss of time involved in getting ready for a job is seldom given consideration in a woodworking plant. But by checking the cards as outlined this leak can be stopped.

We found after we had gotten our cost system in running order that some workmen required a great many cards to keep track of their time, a new card for each job. In other words, we had to distribute small portions of a man's time over a great many different jobs. Where this was the case, instead of trying to distribute his time, we threw all his time continuously into the non-productive labor pay roll. labor cost as closely as possible and in removing as many charges as Of course, basicly, the value of a cost system lies in itemizing the possible from non-productive account which, distributed as a percentage, is at best not absolutely accurate. In our shop, however, the conditions are such that the distribution of labor as outlined is accurate enough. I have found the percentage of non-productive labor will vary from 35 to 90 per cent., depending upon conditions in different shops.

Form I., Labor and Material Cost Card.

All these items of labor, material and expense are summarized on a card for each job, similar to that shown in form I. On one side of the card is tabulated the productive labor distributed as shown, and on the other side the material cost, distributed, and the expense and supply percentages. The figures given on the card are exact for a cheap library case.

On the reverse side of the card the middle column shows the value of each piece of lumber entering into the construction. In this case, the lumber is figured at $3 per thousand above the purchase price, for yardage and drying, together with a waste percentage of 50 per cent. for No. 2 common stock, 40 per cent. for No. 1 common, and 20 per cent. for firsts and seconds.

Our superintendent furnishes the cost keeper with a list of operations for each part, so that when the results are tabulated he knows when the part is completed. He adds the cost of each operation to the preceding one on cost card (Form I.) so that the productive labor cost at any stage of completion is indicated at a glance. This information is invaluable for an accurate inventory of stock in process.

Some Special Features that Save Time and Labor.

The right column shows the total material cost in the white and the cost of finishing material for each operation found by weighing and measuring from a large run. The left column is the summary, lumber as figured above, finishing material from records, labor from the cost cards. Glue, nails and screws are estimated. Crating charges, made up of actual cost of lumber, with $1 per thousand for yardage and ten per cent. waste, are added. Factory expense supplies and overhead can be used under a general item of expense or subdivided in many ways, should you care to do so.

Of course, no item of sales expense enters into this factory cost. Each branch of the business must bear its own burden. With these records carefully tabulated and every item accounted for over a reasonably long period of time, the results obtained from our cost cards come pretty close to our ledger balances at the end of a year. If they do not, we find the leak and stop it.

These records are of inestimable value when taking inventory. There is no guessing at values of stock in process. As stock is inventoried, give the last operation performed. Your cost man puts the material and productive labor value on each piece after the extensions are made, adds your percentage of non-productive labor, and your costs will be very accurate.

When first installing a cost system, the tendency is to get the best results on paper and thereby destroy its value at once. You want to know how much and not how little your cost is going to be, and to get the results your factory manager must work in perfect harmony with the cost man, and every item of expense, no matter how small, must be given consideration to obtain valuable results. Records for the first few months will not be of great value, but when the workmen are acclimated and everything is running smoothly, you are in a position to establish a selling price that you know will show a profit.

Besides the general advantages in our plant some of the details have been found important. The value of the cost system accrues not alone from the ability to find the total manufacturing cost, but to check leaks. Consequently I have found it advisable to separate supplies and factory expenses on book charges. Supplies are staple articles bought ordinarily at a market price. But factory expense items can vary tremendously. Repairs form an especially elusive item. By keeping repairs accounts separately, when old equipment, poor piping, wiring and machinery are proving expensive, the account will often show that it is wise to replace the old equipment with new. The proportion of non-productive to produmtive labor is another item which can be watched.

Cooperage Manufacturing Costs

At the recent annual meeting of the National Cooperage Association held at St. Louis, Mo., the following report was presented by the Costs Committee:

Mr. President and Gentlemen: Your committee, after considering the question of how we could benefit the membership of your association by working out a cost system, discussed the various items attendant to receiving, yarding, kiln-drying, unloading and hauling of the day's run of barrels, taking, for instance, oils, tierce and other packages of this kind, a yarding charge should be about 2½ cents.

We suggest that in summing up the various items in the production of barrels where we have a fair average run, that in consideration of the charges which come from following the barrel through the dry-house, the jointer, the raising, slamming, steaming, windlass, firing, trussing, buffaloing, heading up, lathing, hooping off, inspecting, trimming, loading, teaming, office-help, foreman, night watchman, engineer and cleaning up, one should see that we have not overlooked any charge, and in basing our price should add enough for each item to be dead sure we are right. After comparing notes in this operation, we discovered that a minimum of 17 cents would only be a minimum in making 800 oil tierce packages.

Then comes the question that more people go wrong on than any other, and that is the question of overhead charges. There are many concerns where the proprietor creates the business, and is the business, that never charge up a salary or expense of charities, or many other items which he pays out of what he draws out in the year, but is never charged in the making of 1,000 packages. A few of the items necessary to charge for in manufacturing are the employer or manager's salary, insurance, light and water, oil and waste, gas, heating, repairs, taxes, wear and tear on machinery, political fund, charity, subscription to the ball of the hoopers off, the shipping clerk's delight, advertising, and the one hundred and one items; when it is a big operation and a sales manager is employed the selling cost runs into some money and if the business was systematized it would be easy to work out the various items. Then there would no doubt be discovered some leaks that are not covered now in the labor cost, which would include delivery and making, handling and delivering the packages,

Of course, when the boss draws a good salary (that is, about one-third of what he could get if he was working for anybody else) he can afford to pay a couple of thousand dollars a year to maintain an automobile, go to an association and play poker, and many other items which should be included in this overhead charge, which, in most concerns is greater than the labor cost. The comments made give a few items in the cost of the manufacture of the barrel and still omit a great many leaks that are discovered after the horse is stolen, such as waste, particularly at the jointing wheel.

We had some interesting information yesterday in reference to the loss in jointing staves, and it is not necessary to impress on you the need for watchfulness all the time of the men who are jointing your material, but a remedy, as seen by one or two members of the committee, might be helpful. Our president keeps count on his stock that goes into the factory and up to the jointer, and thus learns first, who is wasting timber; the man that is getting quantity and quality in material; and a comparison of the figures on the various men operating jointers keeps them on edge and insures both quality and quantity of effort for the benefit of the institution and the employe benefits because he works on a percentage basis; and all are satisfied because they make more money.

Another leak is broken staves. There might be a minimum of 10 or 12 staves in a thousand ash tierce barrels, or there might be 200 broken staves in a thousand red oak tierces, due to over-drying or something of the kind, and if you are not adding at least one-half a stave to the average number going into barrels you are not covering your waste, nor charging for this item a leakage.

In handling the stock there is also a chance for leakage, not only due to the neighbors needing firewood, but unless stock is tallied, careless or dishonest shipping would mean another loss, therefore, a stock book showing the amount of staves on hand and in the yard all the time is not only desirable to prevent leakage of this kind, but also is as good as an insurance policy, and you can show what stock there was on the 7th day of March if you had a fire that night. It is easy for the insurance man to determine the amount on hand, and while you carry insurance in your overhead charges, if you should have a fire, the loss is easily adjusted. It might amount to $5,000, due to one fire, but the customer of 1911 does not pay any of this contingent insurance—but he ought to, because you never know what a day will bring forth.

Then there is the question of bad accounts, although in the packing house business this is absolutely the only redeeming feature; you can get your money in ten days, and you know you have got part of it back anyhow.

I would suggest that members here, just off-hand name the various items which determine their costs, as perhaps we have overlooked something; it is barely possible you might have overlooked something yourself, for I do not need to tell you that the margin in barrels today needs looking after, unless you want to have a funeral for some good natured cooper who would sooner sell his barrels for nothing and have the good will of the consumer, than make money and stay in the business.

How Many Knives?

Now that we are in the midst of a change in both spirit and practice in regard to planer knives and cutterheads, it won't hurt to inject still another question into the many that the designers and users of machines are concerned with. The new question is, how many knives constitute the ideal cutterhead? Do not confuse this question with one that has been discussed often before—of the relative merits of two and four knives—but consider it entirely apart. Take for a starting point the idea that thick, small saws give excellent results when operating as cutterheads. There was an account, in a recent issue of the Wood-Worker, of a man seeing flooring tongued and grooved with saws for cutters, and he complimented the work done with the saws. He said it seemed to be smoother and in nicer shape than the regular cutterhead work. Now, what would the effect be if there were as many knives in planer cutterheads as there are teeth in the ordinary dado or grooving saw? Would it mean better work or not? Also, would it require more power? The number of knives a cutterhead will carry has been limited, in times past, by the nature of the head and the manner of fastening the knives. In developing the new cylindrical cutterhead it is possible that we may be able to put two or three times as many knives on a head as formerly. Therefore, this question of just what number of knives constitute the ideal is strictly in order and might well have a little special attention.—The Wood-Worker.

The Retail Dealer and His Problems

Some Important Considerations Regarding Trade Ethics

Unethical Shipments*

There are two great divisions in the lumber business: one is known as the buyer and the other as the seller.

The buyers of the lumber, as we see it, are divided into three classes:

First: Strictly retail buyers.

Second: Manufacturing establishments who buy lumber from any market they can.

Third: Contractors, who feel that they are too large to buy from the retailer, and who make it a point to buy in carload lots from the wholesaler.

The sellers of lumber are divided into three classes:

First: Manufacturers.

Second: Wholesalers.

Third: Jobbers.

These are engaged in the manufacture and sale of lumber and its by-products in car lots to the retailer and users of them, and we do not deny any one of these the privilege of conducting his or their business as they may see proper, so long as it is done fairly and honestly.

The Legitimate Buyer.

In thinking this over we have decided that there is only one legitimate buyer of lumber, and that is the retailer. We understand the retailer to be a man or firm who has some capital that he invests in lumber, which he puts in stock and retails it out to the customers in his community. The retailer is supposed to be financially responsible, has a line of credit, and sufficient funds to conduct his business. He should have an office which will be kept open each day, where orders are taken, bills paid, lumber purchased and business in general conducted. This should serve as a definition of a retail lumber dealer, and this is the person whom we claim is the only ethical customer of the wholesaler.

If a retailer locates his business in a community, invests his capital, has proper equipment, employs a force of help, contracts obligations, resides there, and is a factor in the building up of that particular city, town or section, then he has rights that must be recognized, and everything should be done to foster and encourage, giving to him all help possible, especially by those who hope to profit by his success.

Such as we have described are the units that go to make up the business of the carload seller, whoever he be, and all that is done to strengthen the customer and assure success is adding to the trade in general. But if, on the contrary, the carload seller feels that he has no interest in the party of the first part, further than to send his representative and sell him if he can, then, if he fails to sell, which may be for various reasons, the salesman is instructed to go out and see all large contractors, all manufacturing establishments, all coal mines, or anyone who can raise money enough to pay for a car or who has sufficient backing to warrant them to sell a car; just that soon the wholesaler begins to cripple his present or prospective customer and to be unethical.

My claim is that the wholesaler has no right to sell anyone but the retail dealer, so long as the retailer feels that he wants the trade in his own community, and so long as he takes proper care of the customer in a perfectly honorable, fair and upright manner. My reason for this statement should be obvious without further explanation; but, to be more fully understood, I will just say it is a fixed principle, that no business can succeed without successful customers, and their protection is imperative or loss is sustained. And we are fully convinced it is poor business ethics for any car seller who makes his profits by selling on a large scale, or wholesaler (and poses as such), to sell to any other than a retailer. The two should go hand in hand, each helping the other, and giving proper recognition to their respective rights.

Duties of the Retailer.

After a retailer starts in business and has his force and stock all in good shape for trade, he has other duties besides selling and furnishing his customer. No small part of the work of some member of the force, usually the proprietor, is the purchase of stock and entertainment of the gentry known as "travelling men," representatives of wholesale firms; they are necessary, they are needed, usually they are gentlemen and, as a rule, very considerate. But with all that it takes the valuable time of someone, and no small amount of it, all of which is costly. Many are they who journay to your office during the year, often going away without an order and no doubt feeling unfairly dealt with, but allow me to say right here that I think I voice the sentiment of all buyers when I say nothing affords the purchasing man more pleasure than to place an order with each man who calls to sell, particularly if he can get high grades at low prices and trade justifies it.

The following dialogue may be familiar to many of you: In steps a salesman, who has to offer for sale anything you may need. You are not buying, but he is out to sell, and you repeatedly state that you are in need of nothing, then as a last effort this is what we may hear: "Oh, by the way, don't you want a car of No. 1 common yellow pine flooring, old grade, flat back, from ten to twenty feet, bundled, coming from our best mill, running largely 'B'? In fact, you can put it out from 'B.' Of course, we do not expect you to cheat your customer and do that, but it's too good a grade for the money. Why, I just saw them unloading a car at Akron which I sold, and they are hauling it right out of the car on the job and it goes for 'B.' There may be an occasionel board which is not up to 'B' grade by reason of a slight defect in working or a small knot, but it's the best you ever bought for No. 1 common." "Why do you offer such a bargain and how can you do it?" may be asked. The answer comes readily: "Our mill in the south saws nothing but export timber and it works flooring from the outside or sap boards only, hence the high grade." Or he may state that the demand for No. 2 common is so heavy that all the low grade No. 1 common is put into the No. 2 to increase the shipments, and the demand for "B" is so light that the low grade "B" is put into the No. 1 common to get rid of it. Doubtless this all sounds very familiar to you buyers, and isn't it true that we all are attracted by it and often try to believe we are getting a bargain of from $3 to $5 a thousand, when upon second thought and investigation we would find it different?

We are not here to say that the above is given falsely every time, for many are the cars sold too low, taking grades into consideration. Often this line of argument is resorted to in order to sell when the shipper had no intention of sending anything but the cheapest car of No. 1 common. If this is done to defraud it is unethical.

Honorable Dealing.

There is no business which requires more honor on the part of the salesman and more confidence on the part of the buyer than ours. Remember, we have no samples for our first purchase from a new firm or new stock; all must depend upon the knowledge of the business in general and representation. To illustrate: A well dressed, genteel gentleman stepping into your office presents his card; he represents a mill in Arkansas or Missouri; new firm, strange man, all unknown to you. He begins talking his stock, the price on ceiling interests you. In order to get an idea of his stock, you try to figure out from what section he hails, where his mill is located, and if near any other plant from which you have gotten stock. By doing your best, you have nothing tangible to tie to with reference to what you will get. You finally say, "I will not buy, as I don't know your firm or grades." Then he remarks: "Try one car; I need the business," and he insists and almost becomes offended when you positively decline to purchase, apparently not appreciating what he is asking you to do when urging an investment by you of any place from $600 to $800 on faith in a stranger's estimate. This happens somewhere in Ohio many times each day, and we refer to it only to show why good business ethics are absolutely indispensable on the part of the wholesaler or his representative.

In addition to who are the wholesaler's rightful customers, and how he or his salesmen should be governed in statements made while securing trade with reference to quality and shipment, to which I have previously referred, I desire to speak for a short time on the following:

First: What is known as raising or mixing grades.

Second: Increasing quantity or raising invoice, known as short count.

Third: Unfair treatment in the adjusting of honest mistakes.

Fourth: Carelessness in loading cars for shipment.

Fifth: Carelessness in routing shipments.

Doctored Grades.

The raising or mixing of grades is one of the most unethical and unjust transactions that can be perpetrated upon us by the shipper, for, as I have said, we make our purchases on faith and representation, and have no way of knowing what we are to get until a large amount of valuable merchandise is at our station and partly unloaded. This is done at great expense of time and money, and, therefore, it behooves every factor in the deal to act in good faith and to the best purpose. If he be a manufacturer there is no excuse unless by mistake of the loaders; but if he be a wholesaler or jobber, a third and sometimes a fourth party enters into the deal, and he may be the guilty one. Experience has shown that most changes in grades have taken place in transit. Often a car starts No. 2 common and lands in the customer's yard as No. 1 common. No. 2 common poplar is No. 1

---

*Address before Ohio Association of Retail Lumber Dealers.

common or log run when it arrives after being a week in transit. Often a car changes from No. 3 common white pine flooring to a grade better, going from Michigan to Steubenville. Frequently a car of poplar siding changes from No. 1 common to select going from West Virginia, to Columbus, Ohio. Occasionally a car of strictly all white pine No. 2 common flooring is changed to two boards norway, one board No. 3 common and three boards No. 2 common coming from the Northwest to Ohio.

These changes are noted to show what wonderul things can happen in the lumber business, and all unknown to the outside world. This is one way of changing the baser things into gold, and much gain has come to the doers of it. It is a bad practice and should be stopped.

You are all familiar with the attitude of the man or firm who is guilty of this; when you call him he is surprised and astounded; it never happened before; he has shipped millions of feet just like it with no complaint; he can sell more than he can produce, but as he is anxious for trade and this is the first trouble he ever has had he is willing to make it right and inquires what we think is fair in the way of settlement or adjustment. The buyer is modest (now, don't anybody smile) and possibly suggests $2 a thousand feet reduction when it should be $5. The shipper 'phones back that it is too much, can not stand it, but in order to get it closed up will allow $1 a thousand feet; this is accepted and settled for on that basis.

The shipper who raised the grade and had $3 a thousand feet profit on it, and then reduces it $1, makes $2 a thousand or anywhere from $30 to $40 a car. This he calls business. Is it ethical or otherwise?

I hope that ways and means will soon be devised by which all this may be obviated and thus save the loss to the customer and the sin to the shipper. This holds good in all kinds of lumber and its by-products, and may be practiced by any one of the three divisions of shippers, but it is more likely to be done by those who are irresponsible.

With reference to the second item, "Increasing quantity or raising invoice," known as "short count," I have not so much to say about that. While 18,000 feet of flooring may and sometimes does increase from 5 to 10 per cent. while going a hundred or more miles, this so infrequently occurs that it is hardly worth mentioning. This is easily fixed if the man who unloads can count and will take the time and trouble to do so.

"Unethical" Honesty.

With reference to the third item, known as "Unfair treatment in the adjusting of honest mistakes": There are ways that a shipper may be "unethical" and yet honest. For instance, a car is shipped in and an honest mistake in count or grade is made and the retailer reports back promptly; then it is up to the shipper to be fair and civil, and sometimes he is neither; but in the great majority of cases there is no trouble. Occasionally word comes back as though you were a thief or were trying to take undue advantage, and they are sure that nothing can be wrong, their millmen are almost infallible; besides they have the most modern system of tallying; it has been double-checked, and they have had so much more experience that the burden of proof all rests upon you. You get the shipper or his man down or over, after 'phoning and writing several times, and after there is considerable demurrage charged up. Possibly you were needing this stock badly to fill an order, but must wait and leave the car intact (as per instructions from the shipper), regardless of how long it is until he gets around. It is then taken up, generally in a spirit of fairness, but occasionally otherwise; and the hard part with us is to hear the shipper begin to argue that the wane or knots or other defects must be expected and do not hurt, even if it is a little off grade, suggesting that the customer will be none the wiser or worse off if it is sent out by the retailer. And his last plea may be that the car is here and it should be unloaded to save expense and trouble; if you will only help out this time hereafter he always will "be good" and will make it up on the next shipment. No shipper is justified by reason of his superior knowledge of the business, or because the car is in, to expect more than fair treatment.

Careless Loading.

The fourth item is "Carelessness in loading cars for shipment." We find by years of experience that great loss in time and stock has been sustained by the retailer, caused by carelessness in loading of cars at mill and the transfer of stock by the railroad while in transit. Did you ever get a car of yellow pine joist from Virginia? Not recently; say, ten years ago. If you did, you know why I ask, and Virginia was not the only point from whence troublesome cars came; but, I am glad to say, and say knowingly, that all this has changed greatly for the better and our troubles are not so numerous along that line as they once were.

Loading of any kind of lumber is a very important matter, and I think often too little attention is given this branch of the work. You who have had experience will bear me out in the statement that there can easily be a saving of $2 to $5 a car made to the buyer in the way stock is loaded. To fill a car to the roof and drive the last board in with a sledge, then nail all doors with spikes and have the car come in with the wrong side to the waggon or pile causes a loss. To have all sizes and lengths piled together with, say, twenty sizes on a car causes a loss. To have ceiling of two or three grades and as many thicknesses put in a car poorly bundled also causes great loss in time and stock. But necessity and experience have wrought great changes in the last ten years along this line and all for the better. The manufacturer has learned that poor stock well worked and properly loaded out is much better than good stock poorly worked and poorly loaded. Then, since the cars have ben enlarged and minimum weight increased, it is obligatory on the part of the shipper to exercise both care and judgment in this part of the work in order to get weight. We believe it is now the exception when a car of any kind of worked stock is improperly loaded out by the shipper.

The source of greatest trouble and expense comes from the way cars are handled and transferred by the railroads while in transit. And a concerted effort should be put forth by all parties concerned to compel the railroads to exercise more care and intelligence in this very important work.

Lastly, "Carelessness in routing shipments." Our last reference to the unethical on the part of the wholesaler, we shall note, is the routing of cars and the delivery; for instance, if you order a car via B. & O., where you have your yard—where you can unload easily and with small expense, and they send P. R. R. or C. & O. railroad, and you need the car badly and either have to haul or wait until the railroad sees fit to switch, for which they charge. All this causes loss in time and money, and if care is taken it can often be avoided.

Enough as to the unethical; and in closing I am happy to say our good friend the wholesaler has his side of this great question, and I, for one, would be glad to hear him present it, for I am sure it would do us all good.

There are, however, a few things a dealer must do and have to safeguard himself or his firm against the aforesaid irregularities:

First: He must above and over all things know his business.

Second: He must be fair.

Third: He should be a gentleman.

Fourth: He must pay.

Fifth: He must not only know his business, but must do business according to modern and approved methods.

Possessing these five requisite accomplishments, he need have no fear of being imposed upon or unfairly dealt with by his bigger brother, the shipper. I desire to say in closing that I have been in the lumber business since 1885, in the same town. My brother has been there forty-two years. Our business is fairly extensive, but no man comes to our office to sell lumber who does not act the gentleman. We seldom have any trouble, and when we do it is adjusted easily. I flatter myself with having some knowledge of business and men, acquired from my experience of the last twenty-five years, and of all my acquaintances I know of none more honorable, more fair, more genteel, more moral, and more progressive engaged in any business than those whom it has been my good pleasure to meet who are engaged in the manufacture and sale of lumber; and I am proud to say I believe the lumbermen, both wholesalers and retailers, are the "salt of the earth."

Hoo-Hoo Annual Afloat

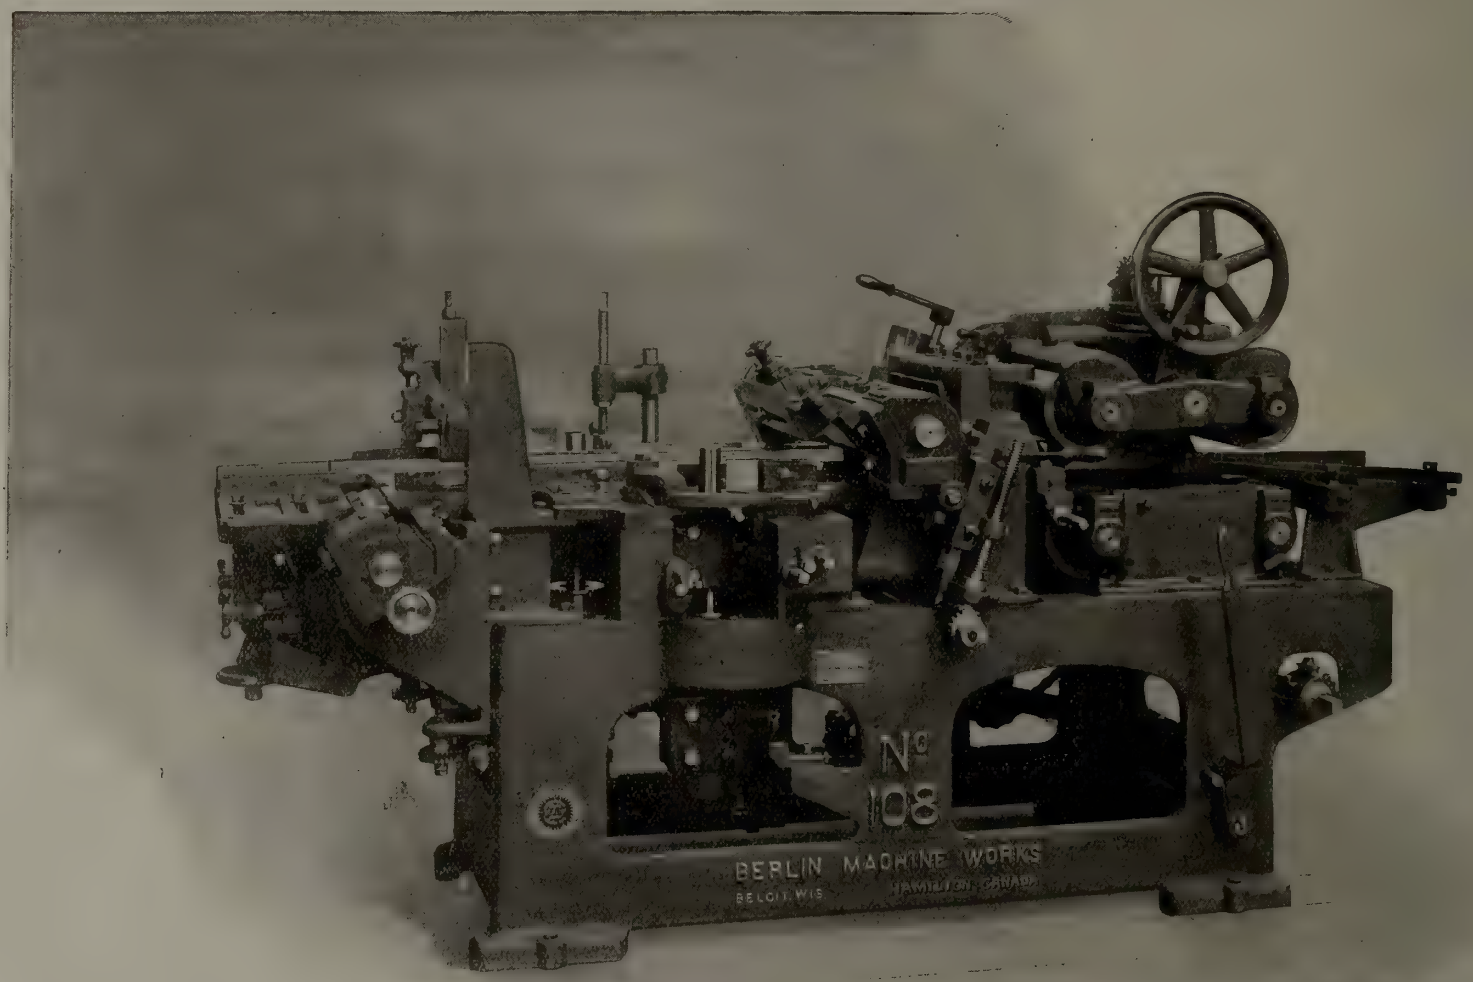
The annual meeting of the Concatenated Order of Hoo-Hoo which is to be held next September, will be one of the most unique events of the kind that have ever been recorded in th annals of the Order, or of any other order for that matter. Instead of having the meeting in some important city and tiring the members out with official welcomes and civic entertainments, the members this year will embark upon a splendid vessel and spend the best part of a week upon the bosom of the waters of the upper lakes. The palatial steamer "City of Cleveland" will leave Detroit on Saturday, September 9th, with 400 merry Hoo-Hoo and their friends, about 500 in all, on board, and will probably return on Thursday, September 14th. During the trip the business meetings and entertainments of the "Annual" will take place in the splendid assembly halls on board the vessel. Already a large number of the luxurious staterooms on the vessel have been reserved and those who desire to have a choice of rooms had better make early application. The cost of the round trip has been fixed at $32.50 for each person, irrespective of the accommodation secured. This includes stateroom, meals and everything.

A Directory of Manufacturers

A work which is calculated to be of much interest to the lumbering and other manufacturing interests of Canada, is now being prepared by Mr. Fred Cook, of the Ottawa Press Gallery, who edited "The Times' Canadian "Who's Who," published last year. The proposed work, a directory of the manufacturing industries of Canada, is strongly endorsed by Mr. W. H. Rowley, president of the Canadian Manufacturers' Association, as calculated to bring the Canadian producer, and his customers, in closer touch with each other. Every firm mentioned in the Trade Index of the Canadian Manufacturers' Association has been invited to supply data for the volume. We feel sure that the lumber manufacturing interest of Canada will respond promptly to Mr. Cook's invitation.

"The

BERLIN 108 OPEN



No
108
BERLIN MACHINE WORKS
BELOIT, WIS.
HAMILTON, CANADA

Berlin Machine

Hamilton -

Original"
SIDE MOULDER

The No. 108 is not an inside moulder nor an outside moulder. It is a combination of the good features of both these types. From the inside moulder we have used the solid bed, the powerful feed works, and the rigid cylinders. From the outside moulder we have used those desirable features of accessibility.

The No. 108 is a heavy substantial machine built on a rigid one-piece frame which forms a very solid foundation for the working parts. There is no overhanging machinery, for the working parts are all built directly over the frame. This one feature goes a long way toward making it the most substantial moulder built.

The No. 108 has other features which you will appreciate. Glance at the picture and note the arge powerful feed works, the rigid mounting of the cylinders and side head spindles, and the long adjustable wooden shoe which bears firmly on the stock all the way through the machine.

Then there are features of accessibility which can not all be seen in the picture but you will appreciate these when we tell you. The knives are easy to get at when you want to alter or sharpen them. All adjustments are made from the front side of the machine.

But, here is the point which is most significant in the value of the No. 108. It is the product obtained by expert designers who have been over the moulder proposition from A to Z and back again a great many times. In this moulder are contained the latest improvements known to modern wood working machinery construction.

To you these fine mechanical points are of little interest, but you who are daily using wood working tools appreciate most keenly how much profit there is to be obtained from a good moulder.

45 No. 108's sold and shipped last year. Why? Because one man bought, others learned what he was doing with it, and bought too.

If Berlin Tools are a "dollars and cents" proposition in his business why not in yours?

Before you decide on a moulder, we would like to explain the No. 108 to you. We are sure you will then appreciate what we mean by the term "Original Open Side Moulder."

What Manufacturers of Logging, Sawmill and Woodworking Appliances are Doing

Double End Tenoning Machine

Tenoning machines for making the tenons on the ends of pieces which are to fit a mortise in a frame, door stile, etc., have been in use for more than sixty years, H. B. Smith's patents on "Iron Frame" tenoners being dated as early as 1852. The first machines were single-end tenoners, that is, they cut the tenon on only one end at a time, and it was not until 1866 that a double-end tenoner was conceived and started. Ten years later a fully perfected machine was exhibited at the Centenial Exposition, at Philadelphia, where it attracted world-wide attention. Since then large numbers of such machines have been built, each year adding improvements and developing more extended use for the machines, until now. no well equipped shop is complete without one or more double-end tenoning machines of more or less special construction to meet the various requirements to which they are applied.

This brings us to the machine illustrated herewith, which is the latest of more than fifty different sizes and styles developed within the last thirty years by the makers. This new machine was built for the Victor Talking Machine Company for working their hardwood cases, which require to be worked rapidly and with great accuracy. The new machine, as shown in the engraving, will work stock as thick as 3 inches, as long as 42 inches, as short as 5 inches, and as wide as 24 inches; but the machine can be made to vary these dimensions according to order.

The frame is of deep section and of such dimensions and design as to support all of the mechanisms substantially. The frame supports the main countershaft which drives the cutter heads, feed and scoring attachment.

The special countershaft which drives the cope heads and double cut-off saws, is located in the rear some five feet, so as to give good lengths of belting. The hangers carrying the shaft are mounted on a heavy sole-plate, and those which correspond with the movable end of the machine are conveniently adjustable so that the pulleys can be adjusted to proper alignment for driving the copes and saws as they are adjusted for various lengths of work. The cope belts are provided with adjustable binder pulleys for improving the drive and keeping the belts taut, and the belts for the cut-off saws have a like adjustment. This special or supplemental countershaft is driven from the main countershaft, hence all speeds of cutter-heads saws, etc., are relative to one another.

The pressure bars which are attached to the uprights are conveniently adjustable for all kinds of word, and are provided with sectional shoes so as to handle narrow materials of slightly different thicknesses.

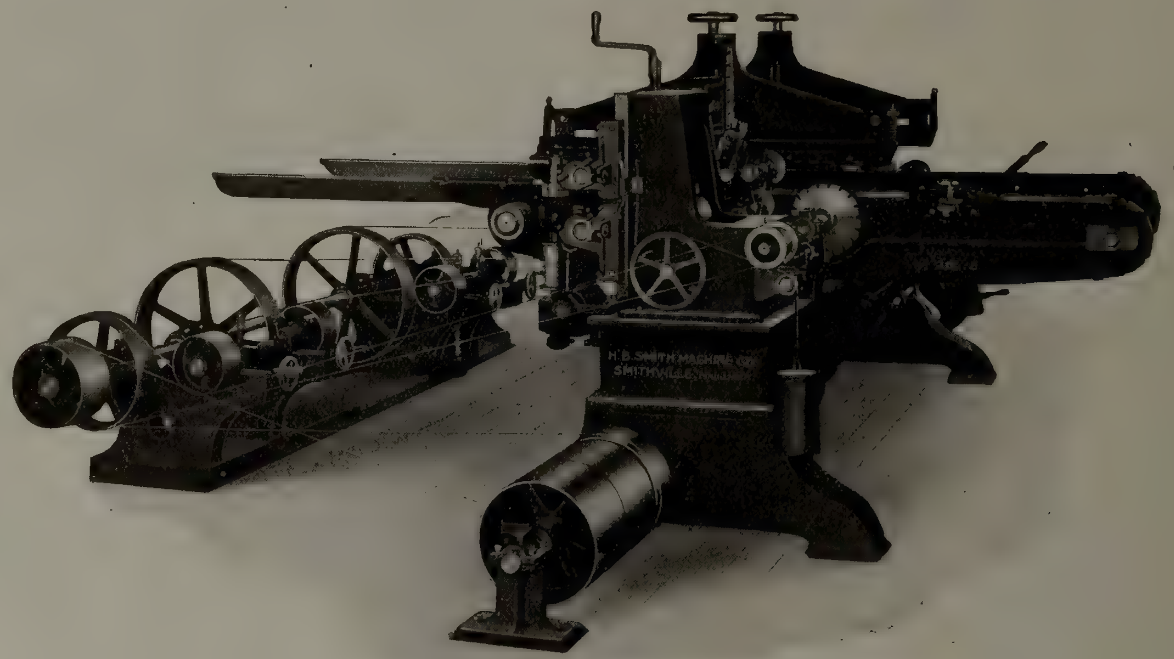
The copes on this style of machine are mounted on the ways and are very strongly driven so as to do heavy moulding work. The cope spindles are made of tool steel and the boxes in which they run are made of hard bronze, and all ground carefully so as to run at a high speed.

The double cut-off saws are in front and preferably below the work, so as to cut against the feed.

The patent scoring attachment consists of four small saws, two above and two below, adjustable so as to score or saw the shoulder entirely through the triple veneered stock, so that when the tenon heads act on the stock, the cutters will not lift the stock or destroy the sharp shoulders of the tenons. This is an absolute necessity and the patent scoring attachment accomplishes the work perfectly.

The moveable end, carrying the ways, pressure-bar, copes and scoring attachment, adjusts by power.

Full particulars will be furnished upon application to the exclusive manufacturers, the H. B. Smith Machine Company, Smithville, N.J.



H. B. Smith Machine Company's New Double End Tenoner

H. Walters & Sons, Limited, of Hull, Quebec, manufacturers of axes, axe handles, lumbering and contractors' tools, have just issued a very attractive illustrated catalogue of 150 pages, which does full credit to the fine products turned out by the firm. A copy should be on every lumberman's desk for reference.

One of the most important pioneers in the work of simplifying the hauling of logs has been the Phoenix Manufacturing Company, and the Eauclaire Mill Supply Company, combined companies of Eauclaire, Wis., U.S.A. Their latest production, "The Steam Log Hauling Locomotive," is interestingly described in an illustrated booklet which the company has recently published. The booklet will be useful to any who have large quantities of logs to transport.

A representative of the "Canada Lumberman" while in Pembroke recently was shown through the large plant of the Thomas Pink Company, Limited, by the proprietor, Mr. Pink. The up-to-date facilities employed by this old established firm in the manufacture of their different lines of lumbering tools, show that they are fully equipped to take care of all orders that come their way. In the woodworking department, peavie handles were being turned out at the rate of two a minute. Ax handlees were split, no sawn, so that there could be no cross-grains found. A peavie complete every minute is the capacity in this one line, and even with that Mr. Pink informs us that they are working night and day to keep up with the season's rush.

WANTED & FOR SALE DEPARTMENT

PUBLISHERS' NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line ($2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same adverticement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Employment Wanted" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies.

Advertisements of "Employees Wanted" will be inserted at the rate of two cents a word net. Cash must accompany the order.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

Mill and Timber for Sale

1,100 acres, well timbered with birch, hemlock, pine, basswood, spruce and cedar, together with new lumber and shingle mill, steam feed, large frame boarding house close to mill, situated on railway siding. Must be sold to close a partnership. Excellent opportunity for small mill man whose supply of timber is cut out and is looking for a new location. Stock of certain length now in yard. Get busy, this is a snap for some one. For further information apply to Box 531, Orillia, Ont. 6-9

The Working Qualities of Mahogany.

There has existed for many years a general impression that mahogany is about the most difficult wood to work there is, since it is so heavy and hard. In connection with the early history of this beautiful wood has always been related the story of how the English doctor wished to use mahogany in decorating his house, but the workmen refused to cut the lumber, saying that it was so hard that it ruined their tools. People have learned since, however, that this was a mistaken idea, and they know now that plain mahogany is about as easy to work as any of the plain hardwoods. When the wood is old and thoroughly dry it gets hard and heavy after being treated with finish. Plain mahogany, however, is fairly easy to work, and it has an advantage which is greatly appreciated by users—it gives little trouble from swelling and shrinking. The wood takes an excellent finish. It is not inclined to split and sliver, and is really easier to work on machines or even with plain tools than hard dry oak.

There are so many different species of mahogany that even an expert finds difficulty in recognizing them, says the "Hardwood Record." Certain varieties blend so closely with Spanish cedar that it is often difficult to tell whether a piece of lumber is the cedar seen in cigar boxes or mahogany. This species is the kind that is easiest to work, as it has a plain straight grain and texture like Spanish cedar. Of course, the wood of the variety which is a deeper red in color is curly, with burls and involved figure and often much cross-grain, and is more difficult to work, but this is no harder than the same kind of figure or grain in oak or maple, and really not so hard, as it is less liable to split. More care is needed and more time must be taken in working a piece of curly or figured mahogany than the plain stock, because of the cross grain, and also for the reason that as a general thing wood of this sort is intended for a higher grade of polish. Crotch mahogany, the figure in which frequently presents practically an end wood for the face, is often a trying proposition to the worker, but it would be just as difficult to handle oak or maple which presented end wood in this way. Since mahogany is such a beautiful wood, and its tones are enhanced with age, the difficulties it presents in working are entirely offset by these advantages.

Virtues of the Red Alder

The American Forest Service has completed a study of the red alder of Oregon and Washington, and the following are its deductions: Red alder (alnus oregona) is the largest of the Pacific coast alders. Its commercial range is limited to the banks of streams and bottom lands west of the Cascades in Oregon and Washington. Red alder trees often grow 60 feet to 75 feet in height, and in diameter range from 18 inches to 30 inches or more. The long, slim, straight trunk yields excellent piling forms, and the resistance of the alder to the attack of marine borers gives it preference for use in the construction of docks and wharves in localities where it is accessible. In the vicinity of Yaquina bay, in Oregon, alder has been in use in salt water for piles and poles for fishermen's nets for 25 years. Numerous instances of continuous use for 15 years in salt water without apparent teredo attack have been noted. Owing to the very limited amount of this timber its use for piling has been restricted. This excellent hardwood tree aids greatly in mitigating the annoyance caused by the deficiency of hardwoods in the Northwest. This wood is reddish brown in color, rather fine, even grained, compact, hard and uniformly colored. It is fairly strong and very durable mechanically. However, when in contact with the soil it is very perishable. In addition, it turns and glues well, takes an excellent polish and shows no appreciable tendency to warp, check, shrink, or swell. The red alder makes an excellent imitation of mahogany, and this, along with its other good qualities, makes it of great value to Northwest furniture manufacturers. Its strength and hardness, and the nicety with which it turns and polishes, make it a highly desirable wood for the manufacture of broom handles. For this purpose it is used to the exclusion of all other species in the Northwest.

Lacing India Rubber Belts.

Cut the belt about ⅛-inch less than the distance round the pulley, and put the seam of the belt on the outside. For narrow belts put the two ends together and make two rows of holes in each end and lace with leather laces. For wide belts put on a backing piece of rubber or leather and rivet or sew it to the belt. If the belt should slip, moisten it with boiled linseed oil. Never use animal oil, as it will damage the belt. For improving and smoothing the surface of the belt, coat its surface with a composition made of equal parts of blacklead and litharge, mixed with boiled linseed oil and japan enough to cause it to dry quickly.

Cattle Food from Wood Waste.

At Port Hadlock, near Seattle, the Claussen Chemical Company is installing a big plant for extracting ethal alcohol and "bristol" from sawmill waste products. The plant is near the sawmill of the Washington Mill Company, and is owned by the same interests. Bristol is a new product, and is used for cattle feed. After the wood is reduced to fibre by chemical process, it is mixed with molasses, making a product that is used, it is affirmed, for stock feed in Europe quite extensively, and which is said to be nutritious. This, probably, is the first instance of the manufacture of "bristol" in the States, at least on the Pacific coast. The plant is being constructed under the supervision of French chemists and engineers, who are familiar with this branch of the industry.

Jointing Circulars.

There are machine men who can't (or at least don't) joint a circular saw properly. Some hold the emery stone on the table and run the saw up to it, while others push a piece of emery up against the saw while it is running above the table. In either case the saw cuts into the stone, making it rounding when it ought to be flat, with good corners on the teeth. A better way is to have a piece of emery stone that is fairly smooth; then, with saw just high enough to touch stone laid flat on the table, move the stone sidewise back and forth across the saw, so as not to allow the saw to cut into the stone. I usually hold the stone with both hands and move it back and forth across the saw, with saw well above the table.

Review of Current Trade Conditions

Ontario.

Trade conditions in Ontario show little if any change during the past fortnight. Most of the large wholesalers report that they are fairly busy, although they could handle a great deal more business without feeling the pressure. The most important factor in holding back trade is the unsettled political situation connected with the reciprocity agreement. The demand for lumber from the United States is not making itself felt to the same extent as is usual at this time of year.

Reports from the Georgian Bay region are to the effect that in a good many lines the dry stocks are well cleaned up. In some localities, where there are still good-sized stocks, they are moving out rapidly. Hemlock stocks are reported to be more thoroughly cleaned up than they have been at this time of year, for many years back. So far as Ottawa is concerned, however, it is reported that there are still fairly large stocks of pine in the hands of manufacturers. The demand for all good grades, however, keeps up, and medium and low grades are moving well, so that by the time new stocks begin to appear it is probable that the markets will be quite ready for them. Although trade seems to have improved considerably as compared with a year ago, contracts in the Georgian Bay district are being made pretty well on the same basis. Some pretty good orders have been coming out recently from the railroads and from the government. The C.P.R. has been ordering lumber for its terminal facilities at Victoria Harbor and elsewhere and the Government has been buying for its improvements to canals and other public works.

The retail trade is fairly brisk and travellers report that retailers are counting on a good year's trade. Lath are scarce and the demand is improving steadily.

A wholesale traveller who has been calling upon the trade pretty thoroughly of late, reports that the cold and wet weather has prevented the extensive movement of stock. Most of the retailers have been buying pretty steadily since the first of the year and stocks now in yards are fairly complete. The traveller referred to, states that retailers are complaining about the large number of travellers who call upon the trade to-day. So many commission men and representatives of small mills are going the rounds that, what with them and the wholesalers, the retailers have a great deal of their time taken up with talking to travellers and trying to dismiss them politely without giving an order or an offence.

The cooperage trade continues to improve and the outlook is more promising than it has been for many months. Stocks of logs and bolts at the mills are smaller than they have been for many years past at the conclusion of the sawing season. Consumers have been placing orders for future delivery more freely than usual. Business effected so far during 1911, is far in excess of that for the corresponding period of 1910. Prices of cooperage stock are improving both in Canada and the United States. It seems reasonably certain that with a good apple crop this year, stocks at the mills will be well cleaned up.

Eastern Canada.

The lumber industry in the Maritime Provinces and Quebec have had one of the best winters for operating on record. Owing also to the gradual improvement in trade during the past year, they now find themselves facing a fair trade prospect, with an ample supply of logs, which have been secured under very favorable cost conditions. Owing to the backwardness of the season very little is being done among the lumbermen at Montreal at the present time. There are signs, however, of the early breaking up of the river and the opening of navigation. Building operations cannot get under way to any satisfactory extent until the weather becomes dry and warm.

The demand for spruce at Boston has improved during the past fortnight. An advance has been effected in manufacturers' prices. Frames 9 inch and under are now sold at $23.50. Buyers are showing a little more interest but a lower level of prices is expected for the summer months. Random has improved and prices are firm. Some manufacturers are asking $21 for 7 inches and under, but sales have been frequent at $20. Dry spruce covering boards are scarce and firm. The demand for hemlock at Boston is rather quiet. Eastern clipped boards are firmly held at $19, though buyers are not paying this price for anything but small lots.

At New York there is no important change in the market for eastern spruce. Prices continue firm. There is an indication of improvement in the cargo business, but most of the business at present is confined to the sorting up car trade. At New York the prices of hemlock are easy and retailers are able to obtain supplies for replenishing stock, without any difficulty. For this reason they refrain from anticipating the spring trade.

Great Britain.

The retail trade in England continues quiet and sales are largely of a spasmodic nature. Buyers, generally speaking, have secured all that they need at present. Importers are keenly looking for attractive prices, but their search is not often rewarded, as shippers are holding firmly. The prospects for trade in general, however, are good. In several districts there are indications of a revival in building. Shipbuilding firms are well employed and new contracts are appearing regularly. At London there is an improvement apparent in the lumber market. The demand is gradually strengthening and spot goods are moving steadily at good prices. The railway companies have placed many of their orders. Reports, however, indicate that their traffic is still increasing and that they will need a good deal more lumber before the year is over. Deliveries at London for the week ending March 25 amounted to 3,470 standards, against 3,307 for the corresponding week of last year. At Foy, Morgan & Company's recent auction sale a parcel of birch from Montreal sold at 1s.1d. per cubic foot for 2 x2/18. Other sales were made at 1s. For 2 x 2/19 and 1 x 3/15, the price was 1s.1d. Dry 3rd yellow pine from Montreal sold at £14.10s. per standard for 3 x 11/9, and £13.10s. for 3 x 11, 6/8. For 1st and 2nd red pine, 5 x 9, 13/19, the price was £14 5s., and for 4 x 11, 12/18, £15 15s. was secured. Thirds brought £12 10s. for 5 x 9 12/19, and £13 5s. for 4 x 11 12/18.

Business at Liverpool continues unchanged. The building trade is not in a satisfactory condition. The spruce market is unchanged. Contracts for future delivery are being made at about £8 5s. to £8 10s. c.i.f., but little trade is reported. Canadian pine deals and boards are moving slowly although there is a fair demand for high grade sidings. Wagon oak plank continues steady. At Manchester a steady volume of trade is in progress. Holders of spruce stocks are firm in their demands and the dock stocks are being steadily reduced, at top prices. There is not much demand for floorings.

United States.

It appears from reports in general throughout the United States, that since the beginning of April, the lumber trade has improved slightly in volume, in spite of the fact that stormy weather prevailed in many parts. This improvement is, of course, seasonable and to be expected. The increased trade, however, is not so great as it should have been for this time of year. Dealers and consumers continue a conservative policy, confining their purchases entirely to current requirements, speculation being entirely absent. Most of the wood consuming industries are going along carefully. There is considerable activity, however, in farm implement manufacturing and in the furniture business, while the vehicle business and the packing box industry are fairly active in some sections. Generally speaking, however, the woodworking industries are not doing any more than taking care of current orders. Railroads are not buying any more ties or lumber than they actually need for repairs. The building trade in many of the cities is very strong.

At Chicago very heavy rains have prevailed during the past fortnight and have caused a considerable decrease in the demand for lumber, for building operations. As soon as the weather improves this is expected to remedy itself. There is a brisk inquiry for northern pine at Chicago and the market is fairly firm, dry stocks being rather broken. There is nothing in the situation to indicate weakness. There is a good demand for hardwood in small lots at Chicago and inquiries for car loads are fairly numerous. Northern hardwoods have been in better demand and prices have improved since the close of the winter. Even basswood shows signs of improvement. Birch and maple are firm. Plain red oak is extremely active and advances are expected.

There is an encouraging demand for hemlock at Chicago. The actual amount of trade is not great, but prices are sufficient to leave a fair margin of profit, which has been unheard of for two or three years. Many of the Chicago yards are short of hemlock and will certainly replenish stocks as soon as navigation opens. Prices of hemlock for water shipment will be higher than they have been for a year or more. Yellow pine at Chicago is stronger than it has been for some months, and manufacturers are determined to get their prices or refuse sales. The expectation is that prices will advance. No improvement is shown in the market for red cedar shingles at Chicago. Prices of extra "star A star" white cedars are high and they are practically out of the market. There is a good demand for lath and prices are firm. The cooperage trade shows a better demand although prices are unchanged.

The better grades of white pine at Buffalo continue scarce with prices strong. Large purchases of number 3 common and better have been made for shipment as soon as navigation permits. The box factories are receiving more orders than formerly. The late spring has held back building operations considerably. There is a demand for Canadian, Adirondack and Virginia spruce, and some dealers report good sales. Prices, however, have to be low to compete with pine. Good grades are selling as inside finish, flooring and novelty siding. The lower grades go for crating. Stocks at Buffalo are light, most of the stock coming in dressed.

There has been an improvement of late in the demand for hard-

wood at Buffalo, and the trade is considered good at most of the yards. Plain and quartered oak, birch, maple and chestnut are all firm in price and stocks in most of these lines are scarce. The price of hemlock at Buffalo is about steady. West Virginia stock is being offered at a pretty low price. Yard stocks are rather broken. Dealers are expecting fair sales with the opening of spring trade. Longleaf pine is taking the lead again at Buffalo and the price has been advancing steadily. Flooring which sold a year ago at $14, and which has seldom reached $17, is now listed at $19. North Carolino pine at Buffalo is unchanged, with a fair demand. The demand for shingles at Buffalo is already very good in spite of the bad weather. Red cedar clears continue to be the favorite, although the price is on a $2 mill basis.

Market Correspondence

Canadian Wood in the United Kingdom

Liverpool, April 3, 1911.—The consumption of Canadian wood in the United Kingdom continues on a very fair scale, up to the time of writing. In some towns, business is spoken of as being quiet, a dull building trade keeping one of the principal sources of demand inoperative for the time being. In other towns, business is more active. The general demand is good and new work has been put in hand in the building trade, so that more orders for timber are coming in from this source. The time of year has arrived at which an outburst of activity is looked for in the building trade, and though the speculative builder is lying low, a considerable amount of good building work of a public kind is being put in hand. It is pretty certain that a fair amount of house property of the smaller class will be built in the course of the next nine months, but there is not likely to be any of the wild speculative biulding which has gone on largely on the outskirts of London, Liverpool, Manchester and other cities, in recent years, and which has made a big demand for cheap joists, floorings and roof wood; doors, stairs, cupboards, shelves and rails. The heavy losses which have been sustained by speculative builders; building societies which have advanced the money for them to build with, and in not a few cases, by those who have bought property when "up," from the builders; have had the effect of establishing something like an equilibrium between the demand for more houses, and the number built to supply the demand. Builders have been less inclined to build, speculatively; and building societies have been less inclined to advance the money for purely speculative building. The house building branch of the industry only has been affected in this way. The building of houses of medium-to-large size; of buildings for public purposes; of mills and of works and warehouses; has gone on steadily, and has made its demand for heavier timber, and timber of higher quality. This demand is still on, and promises to maintain a very fair degree of activity. It requires log stuff in pitch pine and red pine; a proportion of oak suitable for "beams," "pillars," "posts" and other supports, and for dado and lining work; squared timber, joists and battens for roof work; yellow pine of good quality for doors and fittings and spruce of good quality, for floors and other items for which white pine is more suitable than "sweet" and mellow yellow pine.

At London the demand continues moderately good, with much firmness of prices in the spot market. In the late sales, Quebec spruce of 1st quality, 2 x 9/11, has sold at £12.10 per standard; 2 x 7/8 at £11. 15, and £11.10, while 2nd and 3rd quality, 3 x 9, 12/13, have brought £9.15. The quantities of Quebec and of Archangel wood offered have sold readily, the last named bringing £21 for 1st quality, 3x11, and £15.10 to £15.15 for 2nd quality, 3 x 9. Planed wood has been in more demand and has sold at good prices.

At Liverpool, the market for spruce deals continues very firm, and liner parcels have found ready buyers. Recent lots of 3 x 7/8 have been taken up at £8 to £8.5.

Birch is in good demand at this port and quantities coming to hand are at once taken up. St. John's and Halifax wood, lately sold, has brought about £8.5, while 15-inch birch is quoted at 1s.10d. to 1s. 11d. per foot. At Liverpool, pitch pine has been more called for, sawn, especially, being in demand. At Manchester business as between importers and merchants is quiet, but a good business is being done as between merchants and users. Floorings have not been in much demand, and are still inactive. £9.15 per standard may be given as their present value in this market.

Wood Pavements—The use of wood blocks as the material for the pavements of main thoroughfares in large cities, has attained some magnitude in the United Kingdom, though the older forms of pavement have not by any means been superseded yet by the newer one. Most of the larger cities have tried wood blocks in an experimental way, but none of them appear to have adopted such blocks for pavements generally. London has done most towards a general use of wood for thoroughfares on which a heavy traffic by vehicles of the lighter kinds is carried on. Most of the London boroughs have adopted wood to some extent, some of them rather largely. A report has just been issued by the Metropolitan Committee of Materials, on the paving of the streets of London, which contains some valuable information respecting the use of wood as a paving material. The general plan of forming a wood pavement has been, first, to form a foundation of concrete or cement, and to set the blocks on this, then to run a grouting of pitch over the surface and between the blocks, when set; and to finish off with a thin top dressing of fine sharp sand. The making of the foundation is costly work, and the cost of the blocks and of laying grouting and finishing brings the cost of the "wood paving" up to what is looked upon as a high figure.

The report of the Metropolitan Committee affords information as to these items of expenditure which make up the full cost of different wood pavements now in use, or which have been in use, lately in London. In Fulham, for example, larch and deal blocks 8 inches or 9 inches x 5 inches x 3 inches, were used for re-lays or for new paving. The deal blocks were laid on an existing concrete foundation, and were then grouted with pitch and cement. The full cost in this case worked out at 9s. 6¾d. per yard, superficial. Larch blocks were laid on an 8-inch foundation of Portland cement, and cost 9s.6d. with the foundation. The cost of maintaining soft wood pavement was found to be about 1.59d. per yard superficial, on the basis of the cost being spread over the whole wood paved surface of the road repaired. In Hackney, Jarrah blocks, 5 x 5 x 8 or 9 inches were used exclusively. The blocks were dipped at one side and one end in a mixture of boiling tar. In Hammersmith, creosoted deal blocks, some of the 8 x 3 x 4 inches, and some 9 x 3 x 4½ inches, were used. In Kensington a similar paving, with 8 x 3 x 5 or 8 x 3 x 4½ deal blocks, creosoted, was used. The cost in these cases worked out at 6s.9d. to 7s.4d. per square yard without the foundation. Carriage ways in the city of London were paved with deal blocks 3 x 8 x 5 inches, the cost being 10s.3d. per yard with the foundation, and 7s.5d. per yard without the foundation. At Wandsworth, deal blocks 9 x 3 x 5 inches, creosoted and dipped in pitch, were used on a foundation of Portland cement 6 inches thick. The costs in this case were 12s.7d. per square yard in one area and 12s.6d. per yard in another, with foundation; and 8s.6d. per yard without foundation. At Hackney, jarrah blocks, 9 x 3 x 5 inches cost 11s.10½d. per square yard without foundation. In Islington, deal blocks 9 x 3 x 4½ inches, creosoted and with one side and one end dipped in pitch, were used, and worked out at 8s.1d. per square yard without foundation.

In St. Pancras, deal blocks 5 x 3 x 9 inches, creosoted, cost 11s.6d. per square yard with foundation, and about 7s.10d. without. Jarrah blocks of equal size were also used, and were found to cost 11s.6d. with foundation, and 10s.5¾d. without. In Wandsworth, blocks of Achangel softwood 9 x 3 x 5 inches, creosoted and dipped in a mixture of pitch and tar, were used, and cost 12s.7d. with foundation, and 8s.9d. without. In the city of Westminster, creosoted deal blocks, 8 and 9½ inches x 3 x 5 inches, were used, and cost from 7s.1d. to 7s.6d. per square yard, without foundation, and 7s.6d. to 11s.5d. with foundation. With respect to endurance, it was found that in Euston Road, where the traffic was heaviest, the wood pavement lasted 7½years, and that where the traffic was less heavy it lasted 11 years.

With respect to quality, it was found that to attain the best result, the blocks must be thoroughly sound to begin with, and must be even in texture and quality. The general experience in London appears to have been more satisfactory than in some provincial cities, as the wear of wood pavements in London has been more even than in some cities which have tried wood. Thoroughfares in some cities which have been paved with wood and which have been inspected by the writer, have been so uneven on the surface as to be hardly safe for traffic, a general "buckling" of the surface having come about. Taking the United Kingdom as a whole, however, a considerable use is being made of jarrah, deal and larch blocks, for pavements. The use of wood for the purpose is not likely to diminish, as wood pavements when well laid are found to be very smooth and satisfactory for wheeled traffic and to wear well. A steady demand for paving blocks, though on a moderate scale, may accordingly be counted on.

Wheelwrighte' Timber.—The consumption of hardwood for the making of wheels for road vehicles of the heavier kinds, in the United Kingdom, is still moderately large, and active. The number of heavy haulage lorries, waggons and carts now in use is greater than at any previous time, and is steadily increasing. For such vehicles, ash is still used as the principal wheel making material, and the wheels of lorries and of the more strongly built waggons require a great deal of it. Felloes, naves and spokes are massive, and require much wood. The building of the heavier dock-side lorries, of the lighter railway lorries, of mill and railway waggons, of contractors' carts and coal merchants' carts, of brewers' drays and waggons, and of the numerous lighter kinds of waggons, goes on steadily despite the increasing number of motor waggons and vehicles, heavy and light. Ash, oak and elm are accordingly in good demand for wheel building and road-waggon building.

A witness who gave evidence in a case which was heard in the Shoreditch County Court a few days ago, speaking as one engaged in

The Money Maker Adjustable Rod and Dowel Machine

For converting waste edgings and cuttings into high-grade marketable product.

For factory use where accurate fitting dowels and rods of nice, smooth finish are required, this machine has no equal.

One cutter head turns any variation in sizes from ¼ to 2″. Turns hard or soft woods, green or dry equally well. No choking of the head.

Feed rolls center all variations in squares.

Double the product of any solid chuck machine for the same labor cost.

Machines built to turn as large as 6″ diameter.

All machines sold direct to the user under a demonstration plan that insures the satifaction of every purchaser

Send us a list of the sizes you wish to turn and get our guaranteed proposition with full information as to capacity on your requirements.

W. S. Hawker Manufacturing Co.
DAYTON, O. - U. S. A.

the trade; said that 60 per cent. of the spokes of vehicles running in London were made of American wood, as England could not supply the demand for timber for the purpose. Excellent hardwood is grown in the United Kingdom, but the quantity is limited so that other sources of supply have to be drawn upon. It is very unlikely that motor vehicles will displace lorries, waggons and carts to any large extent, as the motors are finding new duties and leaving the old, heavy conveyances to do the old and heavy work. In the light carriage branch, a large displacement of vehicles has occurred, as motor cars and taxicabs have ousted many of the older hackney carriages and "hansom" cabs. These older, light vehicles represented a large and growing demand for ash, oak and elm, for car bodies and wheels. The wheels, though much lighter than those of lorries, were larger, and so made up by length of parts for what they lost by being lighter.

It is not certain yet to what extent loss will have been caused by the practical extinction of the old hackney carriages, as the newer motor carriages are being "coach-built," wood framed that is to say, while the wheels of many of them are also being made with wood spokes. These spokes, though short, are more massive than those of the old carriage wheels, so that, like the spokes of lorries, they "cut into wood." It is extremely probable indeed that when the new motor vehicles, heavy and light, have found their places, the demand which the motor vehicle industry will make for ash, oak and elm, will fully compensate for the present loss by the supercession of hackney carriages and hansom cabs. For the time being, the heavy branch, the building of lorries, waggons, carts and the heavier vans, is using a large amount of hardwood, and the demand from this branch of industry will at least be maintained. And this demand, it must be borne in mind, is quite distinct from that of the railway waggon building industry. This last named industry in the United Kingdom is now actively employed and is making its own large demand for ash and oak and other hardwoods.

Cooperage Trade in Good Condition

The Sutherland, Innes Company, Limited, Chatham, Ont., report as follows upon the cooperage trade situation: The logging season is now over, and stocks of logs and bolts at the cooperage mills are the smallest for years, so that the production this year will fall short of that of 1910 by at least 25 per cent. In some sections of the country some summer logging will be done, if prices warrant the increased cost of production, but even with a favorable summer, this will not increase the aggregate to any large extent.

Contracts for future delivery have been placed freely; in fact, nearly all of the large consumers have their supplies contracted for, and are protected. The volume of business already done exceeds the same period in 1910 by a large amount, and prospects for future business are better than for three years.

Provided the proposed reciprocity agreement with the United States goes through, it will have a great effect in stimulating prices, as the United States want the very goods of which there is a surplus manufactured in Canada, and which have been shipped there even in the face of a 10 per cent. duty. We refer particularly to the high grade No. 2 staves, which are produced in Canada and of which there is usually a surplus over Canadian requirements. These are much preferred to the ordinary No. 2 which are put up in the United States, on account of their exceptionally good quality.

The general trade throughout the country has been improving for some time and consequently the demand for cooperage stock has been increasing and will continue to increase as the population increases. The elm throughout the country, however, is beginning to be scarce and it is only a question of a few years when some other wood will have to be substituted for barrels. There are still a few gum staves coming from the southern States into Canada, but the consumers are beginning to realize that they will not answer the purpose of elm staves. These staves were thoroughly tried out for flour in Minneapolis and sugar in New York, but were not a success and are hardly used for these purposes at all any more, principally on account of so many of the staves being musty and damaging the contents of the barrels.

Prices of cooperage stock all along the line are improving both in Canada and the United States. If there is a good apple crop there should be a general clean out at the mills this year.

Cottages for mill hands

Improved Prices at Montreal

Church & Fee, Limited, wholesalers and manufacturers, of Montreal, whose mills are located at Labelle, P.Q., in a letter to the "Canada Lumberman," under date of April 1, say: "We have had a long hard winter, with lots of snow, although it has been a fairly good winter for work, with very little lost time in the camps. At this date there is no sign of spring and hauling is as good as ever.

"There will be no logs left in the woods this season, and the cut throughout this section is about the same as usual. Market prices for the coming season appear much better than they have been for some time. There seems to be a very striking demand for hardwood, while some grades of spruce have been sold at an advance in price over last year. The general tendency appears to be towards an advance in price in all lines, which is certainly needed by the manufacturer. Wages during the past winter in the camps have been slightly higher than last year. It is rather early yet to say anything about the spring drives, but from present appearances there will not be any scarcity of help."

Pulpwood Conditions in Northern New York

Editor "Canada Lumberman":—The present winter's output of pulpwood in this district (within a radius of 20 miles of St. Regis' Falls) will approximate 45,000 cords. The larger part of this wood was hauled to the St. Regis river, by the St. Regis and Remington-Martin Paper Companies. Standing timber that was burnt-over two years ago, has nearly all been cut. The future policy of these firms will be to curtail the cutting of green timber and buy more in the open market.

The St. Regis Paper Company have standing timber (in this locality) sufficient to last them five years longer. Assuming that they cut 15,000 cords per year,

Wages in the pulpwood camps have ranged from $26 to $35 per month. Men have come here to work from the vicinity of Three Rivers, Que.—190 miles distant—when they could have earned nearly or quite as much nearer home.

The Brooklyn Cooperage Company's output of hardwood logs will approximate 16,000,000 feet. These will be used in the plants at St. Regis Falls and Tupper Lake. This company recently closed a contract for 50,000,000 feet of timber at $11 per thousand feet, delivered to the company's railroad, logs to be scaled by the Scribner rule.

In this vicinity the pulpwood and cooperage industries are germane. First comes the pulpwood maker, who strips the land of every stick of timber down to 4 inches diameter. Next follows the hardwood lumberman, who cuts down to 8 inches diameter.

Sawmill owners here find it more profitable to sell their logs for spot cash, delivered, than to saw them into lumber. One reason in particular is obvious. It has been demonstrated that from 20 to 30 per cent. of hardwood lumber, here in the Adirondacks, will run to shipping, and mill culls. This applies to maple cut from trees 13 inches to 31 inches diameter, breast high.

Geo. B. Oberton, North Bangor, N.Y.

Great Britain Lumber Trade Improving

The Timber Trades Journal, of London, England, in their excellent annual special issue, which appeared on March 25, present an interesting review of the 1910 trade. "In contrast with the rather depressing records of recent years," they say, "it is satisfactory to be able to report a gradual all-round improvement in the timber trade during 1910, notwithstanding that the course of business was interrupted by two general elections and hampered by serious labor disputes in the shipbuilding and coal trades. Financial embarrassments in the timber trade were few, and those of a serious character were attributable to the influence of the unremunerative business in the preceding years, and did not reflect on the sound financial basis on which the trade was conducted.

"The import of hewn and sawn at United Kingdom ports shows an increase of 500,000 loads in quantity over 1909, and in total value an increase of £2,384,224. It is noteworthy that more than half of this increase, both in quantity and value, is placed to the credit of sawn wood. The import of mahogany was about 20,000 tons more, estimated at an increased value of £176,640, on the total import.

"As regards the north of Europe market, the decline in the volume of export from Norway has been more than counterbalanced by the increase from Sweden, and the steady increase of shipments from Russia is again an outstanding feature. Each year larger quantities are received from the White Sea, St. Petersburg, and Riga, and these are all drawn from over a vast area of country, even from as far as the east of the Urals and the Petschora district, and the latest Russian province to seek an outlet in our market is Eastern Siberia, softwoods and hardwoods having been shipped from Vladivostock and other East Asiatic ports. In volume of export the largest wood shipping port in Europe now is Ragi.

"In American business there was only a slight increase in the total imports from Canada, and in hewn timber from the United States, but sawn timber from the latter source of supply wass less in quantity. What effect the proposed Reciprocity Agreement between the States and Canada, which has unexpectedly been put forward this year, may have on the course of the timber trade of this country with trans-Atlantic sources of supply is at present a matter of conjecture only.

"That the approaching opening of the Panama canal will have far-reaching effects on international commerce is universally admitted, and its effect on the expansion of the timber export from the North Pacific is expected to disturb the equilibrium of trade in the United States and this country."

CONGO ROOFING

Guaranteed Until 1921

The Owner of any building covered with Congo Roofing is not only satisfied with his purchase, but has the satisfaction of *knowing* that it is *guaran'eed* for 10 years.

That's real protection.

Every roof of 2 ply and 3 ply Congo is guaranteed in this way,

In every roll of Congo is a *genuine legal y binding Surety Bond* issued by the National Surety Company of New York.

This year we will guarantee thousands of roofs all over the country *to last till* 1921 on this basis.

Of course we are not going to lose — we are offering a sure thing, as Congo will last *more* than 10 years.

National Surety Company
New York
CONGO ROOFING
Guarantee Bond
GUARANTEE

Fac-simile of 10 Year Bond

One thing the guarantee forces upon us; it makes us extremely careful in manufacturing.

We make doubly sure that every roll is perfect. We use the best material that money can buy.

Another detail is the nailing. To avoid any trouble from this source, we provide free of charge, *galvanized* iron caps which are rust proof, and will last as long as the roofing.

In every way we protect ourselves against the possibility of a complaint.

Send for a copy of our Guarantee Bond, and a Sample of Congo Roofing. The guarantee will show you what a real legal roofing looks like.

CONGOLEUM

We should like to send you a sample of Congoleum. It is fitted for floors and wainscoting in homes, stores, offices, etc. It is a perfect imitation of oak. Its surface has a high polish Unusually durable. The price is very low. Write for samples and further information.

The American Lumber & Mfg. Co.
Publication Bldg., Pittsburg, Pa.

New Brunswick to Prohibit Pulpwood Export

Fredericton, N.B., April 5.—In the Legislature to-day, the Hon. Mr. Grimmer, Surveyor-General, introduced a bill to prevent the export of pulpwood from the Crown lands of the province. The Act provides that every timber license or permit conferring authority to cut spruce or soft wood trees or timber, not being pine, suitable for manufacturing pulp or paper, on the ungranted lands of the Crown, shall contain and be subject to the condition that all such timber cut under the authority or permission or such license or permit shall be manufactured in Canada, that is to say, into merchantable pulp or paper or into sawn lumber, woodenware utensils or other articles of commerce or merchandise, as distinguished from the said spruce or other timber in its raw or unmanufactured state.

There are provisions for the enforcement of the regulation and also exempting such logs as may be required for fuel or building purposes. The regulation applies to all licenses or permits hereafter issued, whether for the first time or in the renewal of licenses or permits heretofore issued or granted, and the Act comes in force when proclaimed by the Governor-in-Council.

St. John River Log Driving Contracts

The annual meeting of the St. John River Log Driving Company was held at Fredericton on April 5th, and Messrs. Wm. W. and Geo. Aitken, of Fredericton, were awarded the contract for the corporation drive at the following advertised rates per thousand superficial feet:

1st—From the head of the Grand Falls, 25c.
2nd—From the mouth of Salmon river, 23c.
3rd—From the boundary line on the Aroostook, 25c.
4th—From the mouth of Tobique River, 19¼c.
5th—From mouths of Big Presque Isle and Becaguimic rivers, 15½c.
6th—From mouth of Meduxnikik and below, 13½c.

The old board of directors were re-elected as follows: J. Fraser Gregory, president; F. C. Beatteay, C. P. Baker, J. A. Morrison and G. A. Hilyard. Mr. Louis H. Bliss was re-elected secretary and treasurer.

Protest Against Shipping Act

A large and influential delegation of New Brunswick lumbermen left St. John on April 6th for Ottawa for the purpose of asking a change in the law passed last year making the shipper responsible for the loss of a cargo at sea. This act was passed last year, and the lumbermen contend that its going in force would practically kill the transatlantic trade in lumber as the bills of lading under these conditions would not be accepted in England as negotiable securities. The matter has been discussed at meetings of the provincial lumbermen, and it was decided to send a delegation to ask that the ship be made responsible for all loss or damage to cargo. Those in the delegation were J. Fraser Gregory, George McKean, Hugh MacKay, Jarvis Wilson and Fred R. Taylor, of St. John, and James Robinson, Sheriff O'Brien, F. E. Neale and Edward Sinclair, of Miramichi.

Building Activity Increases

Building activity throughout Canada during January and February was much greater this year than last. The increase during February was more general and greater than during January. Following are the comparative figures:

City	Jan. 1910	Jan. 1911	Feb. 1910	Feb. 1911
Toronto	$682,088	$ 458,580	$860,440	$ 969,590
Montreal	159,510	365,840	274,030	642,428
Winnipeg	188,000	199,700	335,900	432,500
Vancouver	631,311	1,412,442	880,795	1,047,790
Hamilton	19,000	39,250	37,650	75,450
Ottawa	57,650	29,100	97,200	64,500
Victoria	128,985	151,455	151,760	182,940
Calgary	106,500	296,040	169,800	333,660
Regina	24,585	9,225	28,255	67,975
Edmonton	44,090	38,405	29,130	83,825

Yellow Pine Specialists

The Harwood Lumber Company, of Cleveland, Ohio, are making rapid strides in the long and short leaf yellow pine industry. They are ably represented in the local market by W. C. Harwood and are shipping some of the finest of long leaf timbers into Canada. Being practical men they know how the stock should be manufactured and are building up a splendid business on quality.

The general manager, Mr. J. J. Harwood, left Canada fifteen years ago and spent ten years manufacturing in Mississippi. They have a good line of mills, ample timber and every facility for handling large or small orders promptly.

Mr. R. R. Harwood, president of the company, represented them until recently in the West, but is now engaged actively in Cleveland. Mr. W. C. Harwood has long been a resident of Toronto, and is well and favorably known to the trade here.

GOODYEAR

The Winged Foot stands for Quality

RUBBER BELTING

Mr. Millowner are you having belt troubles, if so you are not using Goodyear "Quality" Belt, and you are the man we want to get in touch with. Write us fully giving the size and speed of your pulleys and all the conditions under which the belt must work. We will then have our expert go over the information and quote you a price on a belt that we will absolutely guarantee to do the work required.

If you will give us an opportunity we will demonstrate to you that your best insurance against shut downs and long delays is "use Goodyear Quality Belt," every piece of fabric used in its construction is carefully tested and unless it comes up to our specifications it is instantly rejected. Only the highest grades of rubber are used and this makes it impossible for the layers to separate, and also insures a true, straight running belt. Write our nearest branch for further particulars.

"Just Right"

The Oneida Steel Pulley

is "just right" because it is the only pulley built which fills all the requirements of a good pulley.

It has great strength, best belt adhesion, secure grasp on the shaft, fine balance and it is made in the greatest range of sizes of any steel pulley in the world.

Are not these facts worthy of your consideration when in the market for pulleys?

Try a sample.

A postal will bring our complete catalogue to you.

EDGINGS

Ontario

The Laing-Ritchie Company, of Essex, Limited, Essex, Ont., planing mill and lumber business, has been taken over by the Naylor Lumber Company.

Reports from Oshawa, Ont., state that large quantities of pulpwood are now being shipped to the United States by way of the Cobourg ferry.

Fire in the lumber mill of George McAllister, Guelph, Ont., on April 4th, destroyed the sawmill and some lumber, valued in all at $3,000.

The Hettler Lumber Company, who have been operating on the Dokis Indian Reserve on the French river during the past winter, will take out about ten million feet this spring and will have it cut at Manley Chew's mill at Midland.

The progress in the erection of the Shevlin-Clarke sawmill at Fort Frances, Ont., has been very rapid and the mill proper is nearly completed. About all that remains to be done is the placing of the machinery. The planing mill also is rapidly nearing completion.

On April 7th the large planing mill of the James Smart Co., Brockville, Ont., was cutted by fire, a large portion of the stock and equipment being destroyed. Spontaneous combustion is thought to have been the cause. The loss is between $6,000 and $7,000, covered by insurance.

Lumbermen in the Rainy River district complain that owing to the early disappearance of snow this spring they still have large quantities of timber in the woods to be hauled out to the rivers and lakes. They also say that the sudden melting of the snow will keep the drives back until rainy weather sets in.

The Crown Lumber Company, of Woodstock, Ont., are building a large addition to the factory, and contracts for it have been let. The building is to be of cement blocks, and will be 155 feet by 70 feet, one storey high. Mr. R. E. Butler got the contract for supplying the lumber. The new building will be used as a factory for bent wood working.

The town council of Dryden, Ont., have decided to submit a by-law to the ratepayers for granting tax exemption to the Dryden Timber & Power Company for ten years and for giving to the company the town's interest in the Dryden Park, in consideration of certain buildings and operations to be erected and carried on by the company. The transfer is to be protected by a satisfactory bond for $2,000 to be given by the company to the town guaranteeing fulfilment of all the plans and proposals agreed to.

Fire caused $50,000 loss to the plant of the Kensington Furniture Company at Goderich, Ont., on April 6th. The loss is covered by insurance. The plant consisted of three buildings, two wooden and one brick. The two former were wiped out, and the latter was badly damaged. The fire started in the top floor of one of the wooden buildings, used as a packing room, and spread rapidly to the second wooden building, where varnishes were stored. The firemen had a bad breeze to work against, and were thus handicapped, but succeeded in saving the machine shop. The burned plant was owned by F. G. Rumball, of London; Ont., and his son, John Rumball, was the manager.

Incoming lumberjacks at Ottawa are credited with having been the cause of an outbreak of smallpox in the city. Twenty-eight mild cases were reported recently as existing in the city. Four hospital tents have been erected. Quite a ripple of excitement was caused by the arrival of a lumberjack who consulted an Ottawa doctor. He was plainly marked with the disease and had to be taken to the hospital immediately. At first there was no ambulance available and the trip to the hospital was commenced on foot, in the middle of the road, and under guard. An ambulance arrived in time to assist for the last half of the trip. The medical authorities are not alarmed about the outbreak, as the cases are all mild and no difficulty is expected in handling any new ones which may appear.

The mill of Messrs. Lynch & Ryan, at Deer Lake, Ont., which was destroyed by fire on March 9th, is well on the way toward completion again. Work on rebuilding was commenced at once and new machinery was ordered which is now installed and ready for operation. The mill is of frame construction, 60 x 32 feet, with boiler and engine house 16 x 26 feet. The output is from ten to fifteen thousand feet per day of ten hours. The company took out about 20,000 pieces of timber this year, totalling 1,500,000 feet of lumber. At the time of the fire they had cut only about 300,000 feet of basswood, so that they still had about 1,200,000 feet left to put through the mill. It was necessary, therefore, to rebuild at once. The company also have about 500,000 feet to cut at their other mill, at Cordova Mines, Ont.

A dispatch from Fort Frances says that considerable alarm has been caused among the lumbermen and timber contractors there by the report that the provincial authorities have ordered the dam on Manitou lake above the cascades to be opened so as to raise the water in Rainy lake and Rainy river to give the power company at Fort Frances more water for its wheels. It is stated that the carrying out of this order will mean the stranding of thousands of logs, ties, poles, etc., on the several small lakes and streams above Rainy lake for the balance of the year, unless extremely heavy rains should set in. A strong effort is being made to have the order rescinded. In this connection the council of Fort Frances have passed a resolution calling the attention of the Minister of Lands, Forests and Mines to the fact that the raising of the dams at the Manitou and elsewhere to benefit an American industry will be gravely detrimental to the Canadian lumbering companies operating above these dams, and protesting vehemently against any such action.

Eastern Canada

Olivier Dubois, dealer in carriage makers' supplies and lumber, Montreal, has registered.

The Hull Woodenware Company, Limited, Hull, Que., intend to dispose of their assets by tender.

Bastien & Dagenais, sash and door manufacturers, Montreal, Josephat Bastien and Francois Xavier Dagenais, have registered.

The sash and door factory of Louis Beaudry, at Pointe aux Trembles, P.Q., was completely destroyed by fire on March 28th. The loss amounted to about $50,000, which is mostly covered by insurance.

The B. C. Gazette gives notice of the incorporation of the following companies: Beaver Creek Logging & Lumber Company, Limited, capital $50,000; The Dominion Western Timber Company, Limited, capital $600,000.

The city council of St. John, N.B., have decided to lease the Mispec pulp mill to the Stetson, Cutler Company for a perior of ten years, at $2,000 a year, giving the company the right to purchase the mill for $25,000.

Several new mills have been put up this winter in New Brunswick. A new mill is being put in at Elgin, Albert County, for Thaddeus Graves, and another steam outfit for Albert Wood, at Coverdale, Albert County. R. Laurie, of Polyhurst, has installed a portable mill and Messrs. Price & Armstrong, of French Lake, and A. M. Floyd, of Barnesville, have purchased new engines.

At the New Brunswick Crown Lands Department on April 5th, there was a sale of timber limits, which brought about some lively bidding. Mr. J. J. F. Winslow was the purchaser of a two-mile lot on Fork Brook, Little River, at $47 per mile, and a three-mile limit on Salmon River, Kent County, at $60 per mile, while Mr. H. W. Bailey was the purchaser of a two-mile lot on Maquapit River, paying $83 per mile.

Mr. C. F. Davis, of Newport, Me., and Mr. E. E. Field, of Pittsburg, N.H., representing the Twitchell Lumber Company of New Hampshire, are making a cruise of the Scott Lumber Company's lands which embrace over 56,000 acres in New Brunswick, and they are also cruising the lumber lands owned by Mr. James M. Scott, which include about 6,000 acres. Negotiations are in progress for the purchase of the entire property of the Scott Lumber Company. The amount involved is between $150,000 and $200,000. The company may also operate the Victoria mill below Fredericton.

Gilmour & Hughson's mill at Hull, P.Q., has been reconstructed during the past winter, by Mr. I. N. Kendall, of Ottawa. A twin circular, a 54-inch gang and an ordinary double edger have been taken out and in their place there have been installed an 8-foot Waterous band mill, a Mershon 7-foot upright band resaw, and a large stock edger. The edger is made to cut from 4 inches wide to 10 inches wide. Mr. Kendall in writing about the new installation predicts that this style of edger will, in the near future, take the place of the old shifting saw edger in most modern sawmills, on account of the difficulty of doing exact edging with a movable saw. Speaking of the movable gang, Mr. Kendall believes that the upright gang is also doomed, on account of the class of logs which are being taken out to-day. Leaving out of consideration the thickness of the saws, he states that the band saws are much the best, because with defective logs the good lumber can be much better selected by cutting one board at a time than by cutting the whole log, as is done with a gang.

Western Canada

The Lincoln Saw Mills Company, Limited, sawmill proprietors, Langley Prairie, B.C., are stated to have assigned.

The Similkameen Company, Limited, sawmill proprietors, Princeton, B.C., are stated to have sold out to W. C. McDougall.

P. Abrams, Sr., of Renata, B.C., has purchased a sawmill at Spokane, Wash. The mill will have a capacity of 15,000 feet per day and will be fitted with the most modern machinery. It will be in operation as soon as the transportation company can deliver the machinery at Renata.

Several important improvements are in progress at the plant of the Eburne Sawmills, Eburne, B.C., which will materially increase its output. Among these are the installation of a new band resaw, a new engine to provide more power and new drying kilns which thoroughly dry the lumber within 15 hours without checking, and extract all the pitch from the lumber.

The Hanbury Manufacturing Company, of Brandon, Man., in anticipation of a very busy building season, will bring down the Assiniboine as big a log drive as last year. In past years the logs have not arrived at the Brandon mills till well on in June, but the company has reports from the north that indications for ample water are better than for some years and the drive is likely to arrive earlier than usual.

The mill of the Rat Portage Lumber Company, Limited, at Winnipeg, will be especially busy, as the mill of that company at Rainy River, to replace the one burned last fall, will not be ready for work for some time. D. C. Cameron, president of the Rat Portage company, says that if he gets a reasonable assessment rate from the city of St. Boniface on the other side of the river from Winnipeg, he will spend a quarter of a million dollars in extensive buildings, and along industrial and manufacturing lines there.

Cushing Bros., Company, Limited, have secured 40 lots in the Wilson Park subdivision at Saskatoon, Sask., and will erect a first class planing mill, sash and door an interior fittings. factory. The main building will be 80 x 108, with a wing 40 x 40, and all two storeys. The warehouse and office building will be 64 x 108, and the boiler house, of concrete construction, will be 34 x 40. The company will produce power by steam, and generate electricity so as to put direct motor drive on all machinery. They will employ 50 men, and hope to get going this summer. The company have factories in Regina, Calgary and Edmonton, and regard Saskatoon as a most favorable opening. F. M. Beatty will be manager at Saskatoon.

The consolidation of the Michigan-Pacific Lumber Companies with the Michigan-Puget Sound Lumber Company, was effected at a joint meeting of the shareholders at Grand Rapids, Mich., on March 28. The new corporation, which is capitalized at $2,500,000, will maintain the individuality of the two old companies, although there will be but a single executive head, J. H. Moore, of Victoria, B.C., who becomes vice-president and general manager. The Michigan-Pacific Company holds some 32,000 acres on Vancouver Island, while the Michigan-Puget Sound has 22,000 acres. The following are the officers of the new corporation: President, C. W. Liken, Sebewain, Mich.; Vice-President and General Manager, J. H. Moore, Victoria, B.C.; Secretary, William F. McKnight, Grand Rapids, Mich.; Treasurer, Charles Phelps, Victoria; Superintendent, Delbert Hankin, Victoria.

An important new industry will locate in Winnipeg in the form of a saw mill and four large lumber yards. The new concern is known as the Coast Lumber Yards, Limited, and the men who are most directly interested in it are A. R. Davidson, of Winnipeg; A. D. McRae, A. D. Davidson and Senator Peter Jansen, of Nebraska, and with them there is considerable southern capital. The company have opened two yards in the city. In a timber yard the concern will carry all sizes up to 24x24—60 feet long. The yard on the St. Boniface side of the Red river has a capacity of from 10,000,000 to 12,000,000 feet; the shed, which is just being completed, having a capacity of 2,000,000 feet. A railway track runs through the centre of the shed, so that the lumber can be unloaded directly from the cars in any kind of weather without getting wet. The dimensions of this shed are 80 x 200 feet. In connection with this yard a sawmill will be erected, and the company propose to manufacture on short notice any specially ordered material which the trade may demand. R. F. Bingham, who has had a wide experience in the western lumber trade, will be general manager of the yards.

The Barnhart Log Loader

has been in successful operation in all parts of the country for twenty years and never caused a complaint. We are now manufacturing a new Barnhart Loader known as **Model "12,"** which is specially designed for use in very heavy timber. This loader is built on the same lines as the old Barnhart Loader now known as Model "10" and which we still continue to manufacture. We are operating lumbermen, producing 200.000.000 feet of lumber per annum and we use the Barnhart Loader exclusively. Could we afford to do so if it were not the best? Write us for prices.

THE SHIMER CUTTER HEADS

Service Talks!

170,000 Shimer Cutter Heads in daily use proclaim the merits of these tools.

And they were all sold with the privilege of being returned if not satisfactory.

Thirty days trial of a Shimer Cutter Head has been our best advertisement. The offer still stands.

Let us have measurements to-day for such tools as you need to begin the year's work without being handicapped. Don't wait until you are actually ready to use the tools before giving order.

The Board Matcher Heads

The Shimer Cutter Heads for Box Board Matching will make a uniform cut and a close fit in every instance, as well after years of use as when the Bits are new. There is no friction upon the Bits, therefore no loss of power, no waste of material. The Bits can be expanded for thicker material, with corresponding change in the thickness of the tongue and groove.

Price for two Cutter Heads with 4 Bits each complete to match 3/8 to ½ inch, $29.15.

We also furnish when desired a Yoke Mandrel with self-oiling boxes, boxed f.o.b. Galt, Ont., for $11.05.

Thin Steel Knives

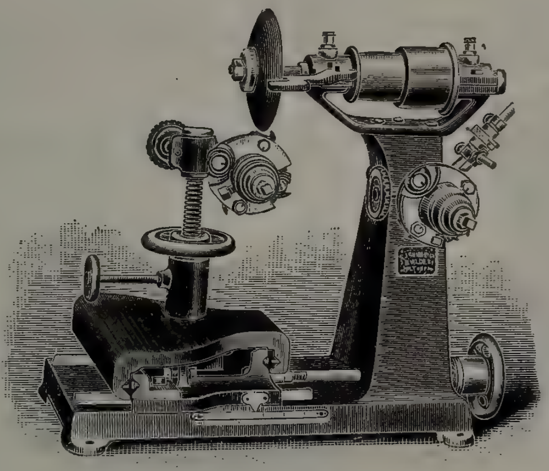
Advanced ideas referring to the planing and surfacing of lumber have developed into the use of the thin blades, made from high speed steel, which when properly tempered and treated, serve for one or two days of work on hard maple, oak or hickory.

These blades are known as our Bedee Knives and are recommended by users as the best that can be procured. For the benefit of those desiring to use this style of a knife we have facilities to furnish them in any length or thickness.

Write us about your requirements.

Wood Forming Cutters

We manufacture Special Cutters of any shape and size desired after the patterns of our Reversible and One-Way Cutters. Let us have your specifications. For odd work not found in our catalogue send a wood sample or drawing.



Save the Cost of Files

Don't spoil good files by trying to sharpen Cutters with a hard temper. It's slow work, and as bad for the disposition of the man as it is hard on the files. Use a Grinding Machine. Steel Cutters of any temper can then be sharpened easily and quickly.

We make two styles of Grinding Machines to lighten and hasten the work of the filing room.

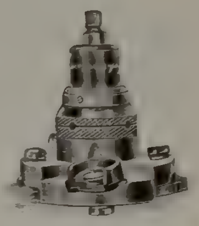
The Shimer Cutter Head Grinder, No. 1. is a simple and effective machine for grinding the Bits of the Shimer Cutter Heads. It is strong and complete with every needed adjustment. Has ball-bearing carriage which is very sensitive in operation allowing the most delicate touch to be made to the Cutter. In addition, it is provided with a tracking attachment for accurately setting the Bits. Price, net, f.o.b. Galt, Ont., $104.

No. 2 machine is lighter, yet sufficiently strong to meet the average need. It has a carriage provided with a regular slide, but it will be found a very practical and useful machine in any mill, Price, net f.o.b. cars Galt, Ont., $45.50.

Our "Best of All,"

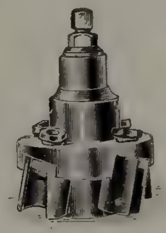
Figs. 202 and 203 are the leading tools, having Conical Duplex Bit Seats and The Shimer Cutter Head Expansion. Flooring Bits will work from 13-16 to 1½-in. thickness with tongue and groove proportions expanded to suit.

Price, net, complete with one set of flooring Bits, the gauges for setting the Bits and wrench **$40.95**
Extra Bits for Flooring **$11.44**
Extra Bits for Ceiling **$10.40**



With 4 Bits to each Head.

Jointer Heads,



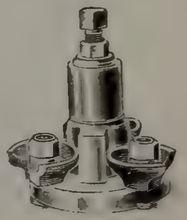
Figs. 54 and 55, with four Bits in line of work, shear the cut downwardly to insure a sharp and clean upper edge. They cut clean and free and are shipped out under our guarantee to give satisfaction.

Price, Heads, complete with Bits for 15-16 to 1¼-in., net only **$31.20**
Extra Bits 1¼ face, the set **$10.40**
Extra Bits, 2-in. face, the set **$12.48**

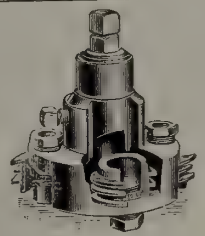
O. J. Batten Heads,

Figs. 48 and 49 represent our best tools for this work, having 3 Bits in line of cut so arranged upon their seat inclines as to protect all but cutting edge against friction and wear.

Price, two Heads complete with Bits, net only **$31.98**
Extra Bits each, net **$2.08**



Double Ceiling Heads,



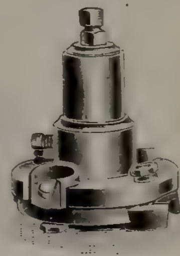
Figs. 45 and 46 are made in solid section, steel forged, with Bits of special design to cut two tongues on one edge of board, and two grooves on opposite edge, to be re-sawed for two thin boards tongued and grooved. Very complete.

Price, with one set of Bits, net **$40.94**
Extra Bits, per set of (8) **$16 64**

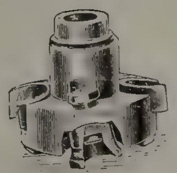
Ship Lap Heads,

Figs. 38 and 39 are made of steel forgings, in solid section, designed especially for heavy duty. The bit seats have the latest improved slants to provide free cutting edges, and we sell them at the following low and net prices.

Heads with one set of Bits to work 15-16 to 1½-in. thick, net **$34.84**
Extra set of Bits **$11.96**



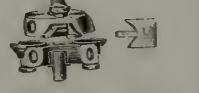
Door, Sash and Coping Tools,



That save all the hand fitting. No changing of patterns, therefore, no trouble in framing door and sash parts when matched with the Shimer Cutter Heads.

DOOR HEADS

Fig. 82, solid flange **$10.75**
Fig. 84, with Expansion **13.35**
Bits to work 1-in. to 1¼ doors, 4 **7.28**



SASH HEADS

Fig. 86, solid flange **$9.75**
Fig. 206, with Expansion **$12.35**
Bits extra to work 1 to 1¼-in. Sash (2 Moulded Bits, $4.30; 2 Rabbeting Bits $2.86) **$7.16**

SEE THAT YOU GET THE GENUINE

Look for the NAME and TRADE MARK. "The Shimer Cutter Head" stamped on every Head we turn out. A dealer who would sell you an imitation means to deceive you—send them back and demand the genuine article with our guarantee for your protection.

NO. 264 SELF-FEED RIP SAW—For Heavy Ripping of all kinds.

NO KICKING BACK

when short pieces are ripped on a Fay & Egan No. 264, Self-feed Rip Saw. The Spring Hold Down and the additional Spiral Springs prevent accidents of this kind.

This, however, is not the only reason why it is to your advantage to buy a Fay & Egan Self-feed Rip Saw. There are other reasons—read them in the opposite column.

A few words about this self-feed rip saw—built for heavy ripping and will be found a satisfactory tool for both light and heavy work—can be used as a single or gang rip-table raised and lowered on worm segments—long self-oiling bearings—outside bearing to mandrel pulley—fence is instantly moved and clamped at any position—a graduated index is furnished for accurate ripping—feed consists of one infeeding and one outfeeding roll. The driving mechanism is is the strongest possible, consisting of a train of sprocket gears and chains regulated by a Three Step Cone Pulley—capacity for material 4″ thick with a 16″ saw and 8″ with a 24″ blade; takes 19″ between saw and fence. By lowering the table and raising the feed out of the way, a timber as large as 12″ thick can be ripped by reversing timber.

We make the most complete line of Circular Rip—Cut-off and Resaws on the Market.

Solid and Inserted Tooth

Circular Saws

We make a specialty of these lines

We remake old Solid Tooth Saws into new Inserted Tooth Saws

Write to us for quotations

Our saws have been before the public of Canada since 1855, and have won a reputation far excelling any other make of saws, combining as they do so many points of marked superiority.

By the old method the tempering of circular saws was to a great extent a matter of chance.

By our Patent Process that uncertainty is entirely avoided.

Being tempered and straightened by heat and pressure in air tight ovens at a uniform heat between heavy revolving plates, we produce a perfectly even temper throughout the plate, and being free from that uneven strain or tension caused by so much unequal hammering they are not so liable to buckle, which was a great source of trouble and expense in the old style of saw.

These saws will stand up to their work better under all circumstances, and being made of a higher quality steel than it is practical to use by the old method, they hold an edge longer and will do more work than any other saw on the market.

We are prepared to make prompt deliveries of all Saw Orders—Rush Orders by mail or wire receive immediate attention.

R. H. Smith Co., Limited

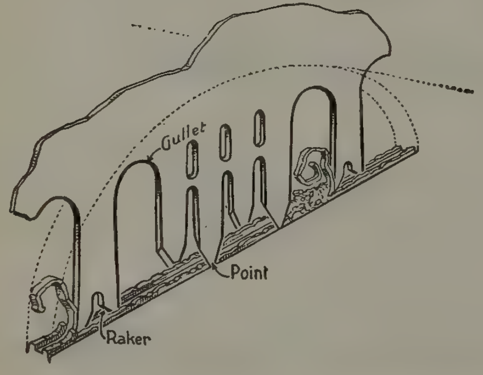
ST. CATHARINES, ONT.



Why Atkins Sterling Saws Run Free and Easy

Saws that depend on "set" for clearance have to tear their way through the timber, like the picture to the left. The teeth are sprawled out on either side and chatter and stick and bind and tear. That's why wood sawing is sometimes considered such hard work. That's why commonly ground saws can NOT run fast or pull easy.

ATKINS SEGMENT-GROUND CROSS-CUT SAW BLADES are ground thinnest on the center of the back. The teeth are the widest part, and the blade drops easily into the smooth cut which is made by the saw teeth. Very little set makes the teeth cut clean and the rakers clear the center. See the picture to the right. These Saws merely require enough power to pull them back and forth. That's why they run so easily.

ATKINS STERLING CROSS-CUT SAWS are the only Saws that are Segment-Ground, and for this reason are guaranteed to run easier and cut faster than any other Saws. Write us for free information, or order through your jobber or dealer. If they won't supply you, let us know.

Isn't it Better to Investigate

"The HOWARD" Vulcanizing Process

than to wish you had

Positively the quickest and most economical system known for drying and Preserving Lumber, Railroad Ties, etc.

POINTS IN ITS FAVOR:

Does away with all kilns
Improves quality of all lumber
Increases the crushing strength
Increases the transverse strength
Reduces the weight 30 per cent to 45 per cent
It materially prolongs the life of wood
Eliminates shrinking, swelling and warping
Emphasizes and beautifies natural grain of the wood
Makes fit for commercial use woods not otherwise merchantable
Does away with necessity of maintaining heavy stock of lumber in yards
By this process green lumber taken from the log can be used for building purposes in 2 or 3 days

---

We invite Lumbermen and Owners of Woodworking establishments to see a practical demonstration of the process at our plant in Toronto

"COVEL"

SAW FILING TOOLS

¶We are the only authorized Canadian manufacturers of Covel Saw Filing Equipment. ¶We underline "authorized" because it has an emphatic meaning. There are others selling what they represent to be Covel Filing machinery. So it is. But it is years out of date. ¶It has been superseded by newer designs that have been evolved and placed on the market because they are better than the old. ¶Being the authorized builders of these tools, we are in direct and constant touch with the designers. Every model they turn out and every improvement added is embodied in the machines we sell you—the latest and best in the Filing Tool line. *Send for our Filing Tool booklet.*

AUTOMATIC BANDSAW SHARPENER NO. 150

The No. 150 Automatic Bandsaw Sharpener illustrated herewith will take a saw with a blade up to 20-in. wide, and with slight variation is built as Nos. 140, 130 and 120, to take saws with 16-in., 14-in. and 10-in. blades respectively.

Frame

The machine is entirely self contained. The frame is built most substantially to overcome all vibration, and is open to permit quick adjustment and easy overhauling of every part. Over-all dimensions 50-in. x 55-in., extreme height 65-in.

Sharpening Head

The sharpening head is adjustable to give a concave cut with a straight wheel, and will set through a 45 degree angle to accommodate the hook of saw teeth. A 12-in. emery wheel is used, has three speeds, and is driven direct from the countershaft. This is made possible by the automatic idler attachment—a new wrinkle—that keeps driving belt always in the same tension regardless of the position of the emery wheel, and holds the belt always in the centre of the pulleys no matter at what angle the head is set. The sliding gate is 1¼-in. thick, slides in "V" shaped gibs so that wear can be taken up by adjusting one gib only. The gate rod controlling the position of the gate in the head is operated by a handle at the front of the gate which permits adjustment without hiding the wheel from the operator, and does away with the necessity of lifting the saw over the screw on the head. A ratchet lever is provided which raises gate and stops motion of the same when cams are being changed or when feed is regulated. All sizes and shapes of teeth can be sharpened, from 1-in. to 4-in. space. Each machine has five cam forms, giving as many standard sized teeth. Each cam is adjustable on the holder to give a large assortment of different shaped teeth. The cam shaft has two speeds and is cone pulley driven from the side of the machine where the belt can be easily regulated or shifted.

Front Feed

The feed arm is pivotted in double, babbitted boxes at the extreme bottom of the frame, making the push on the saw almost in a straight line. As it feeds the saw ahead it also holds it down so that it cannot climb. An adjustable guide holds arm in exact line, and a pull spring attached to it ensures a smooth even movement. Our patented adjustable knife shaped feed finger is furnished. This finger is flat, of ⅛-in. x ⅝-in. high speed steel, has lost motion take-up, and when worn can be readily removed. A replaceable hard tempered steel slide is provided, as is also an adjustable feed finger stop by which over-feed is avoided.

Back Feed

The back feed is simple, positive, and strong. The 1¾-in. shaft put through the bottom frame, carries rocker arm which works against back feed cam. This is round and adjustable from the centre to give more or less throw of back feed finger. The latter can be turned up out of the way and will not interfere when saws are being changed.

Saw Rest

The front bar on which saw slides is 5 ft. long, is furnished with square hardened steel saw rest adjustable so that its four faces can be used. The saw is raised and lowered by crank and sprocket chain shown in cut, making it unnecessary to stoop under saw.

General Construction

All connecting rods are forked, have double bearings to give even and uniform wear on all bolts and bearings. All wearing surfaces are planed and scraped; all boxes are large, are babbitted and scraped, and oil reservoirs are furnished at each bearing.

We Make a Specialty of Prompt Shipments

BARTRAM BROTHERS, Limited

ED. T. SAXE, 200 Claremont Ave. MONTCLAIR, N. J.

OTTAWA, ONT.: Hope Building

440 Square Miles Timber Limits

on Georgian Bay

to be Sold by Private Sale in Large or Small Blocks.

On account of their President and Principal shareholders being engaged in other large enterprises, and not having the time to give to them all, THE PARRY SOUND LUMBER COMPANY, Limited, offer for Sale all of the timber lands, mills and town property situated in the Town of Parry Sound; also Tug Scow and full Camp Equipment for five camps, including boom chains, snow plows, sleighs, etc.

THE LIMITS TO BE SOLD

comprise some 440 square miles of licensed and deeded Pine, Hemlock, Spruce, Birch and other timber. The licenses from the Ontario Government include all timbers and are not restricted for time. Government dues are as follows: Saw Logs, White Pine, $1.50 per M. ft., B.M. Saw Logs, Hemlock, Tamarac and other woods 75c. per M. ft. The timber is situated in the Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street. The Canadian Pacific, Canadian Northern and Grand Trunk Railways run through the limits, which makes some of the parcels offered for sale particularly desirable for small mill owners.

A circular giving full information, maps, terms and conditions of sale will be furnished upon application to

Tie or Log Siding Machine

Will cut over 3,000
Ties in ten hours

This Machine will handle logs anywhere from 4½ to 20 inches in diameter and 30 inches in length up. The mechanism is very heavy and substantially constructed and designed to stand the hard usage to which such a machine is subjected. It will be a welcome addition to the equipment of every tie maker—it will make more money for him.

TRADE MARK
HANCHETT
U.S.REG.59,352. JAN 8,1907

The Filing Room

In the best equipped most efficient mills all over the country, where the value of standard equipment is appreciated—there you will find Hanchett Filing Room Equipment installed. Please note the advantages these mills have secured.

The Hanchett Filing Room Machinery are modern machines, are practical, simple, efficient, easy to adjust, easy to operate, and do first-class work. They are solid, rigid, heavy machines. Made upon honor, and they have genuine merit. The adaption of Hanchett Tools and Machinery for the care of saws and knives means quick installation, low cost of maintenance and renewals, and economy of operation.

THERE WAS A REASON WHY:

Schwager & Nettleton, Seattle, Washington, demanded Hanchett Filing Room Machinery.

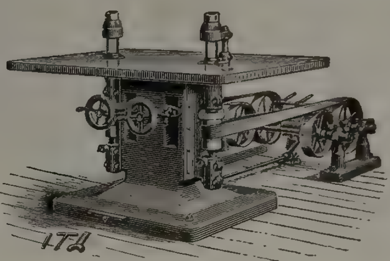
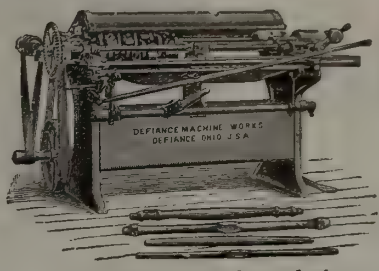
No. 9—36 in. Band Re-Saw

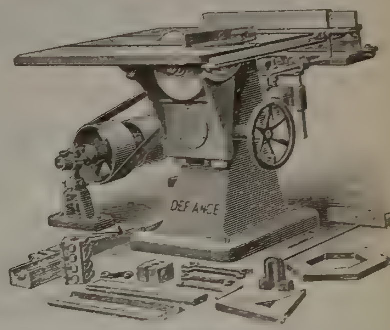


Double Spindle Shaper



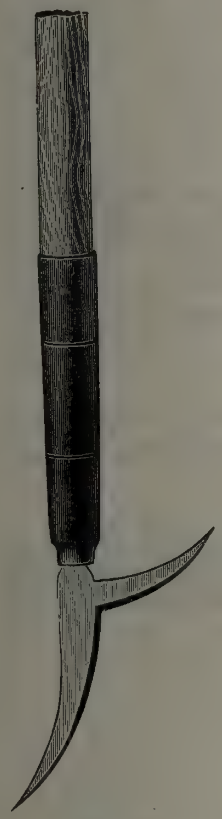
DEFIANCE MACHINE WORKS DEFIANCE OHIO U.S.A.

Neck Yoke and Singletree Lathe

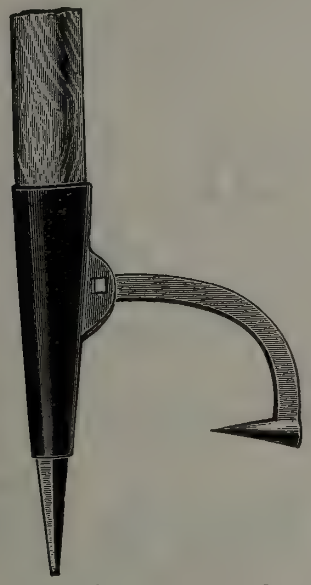


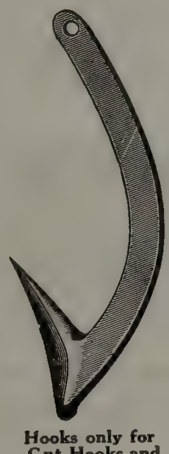
No. 8 Variety Saw

The Soo Line Lumbering Tools are lightest, strongest and best made in Canada

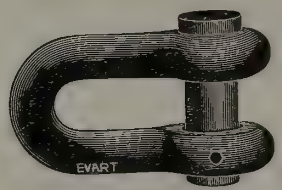


Pike Poles

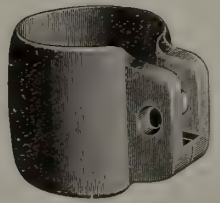




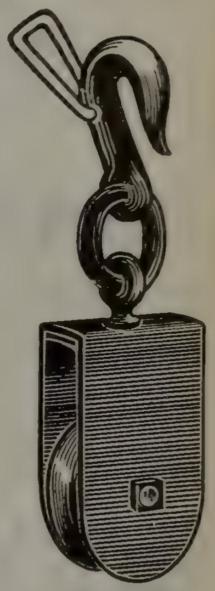
Hooks only for Cnt Hooks and Peavies in ll sizes and styles



Boom Shackles



Cant Hook Clasps



Loading Block

Pike Poles, with select Maple Handles in lengths 10 to 16 feet. With select second growth White Ash handles, lengths 10, 12, 13, 14, 16 and 18 feet. The Gaffs are all hand hammered of Crucible Steel. Threaded and screwed in.

Peavies, with steel or malleable sockets, with round and duckbill hooks. Maple, Elm or Hickory Handles. All sizes and lengths. Everything which is good and practical in the line of Peavies and Cant Dogs you can get from us.

Our Duckbill Michigan Pattern Hook is considered by the leading lumbermen one of the best patterns on the market.

Boom Shackles, made of mild steel with round pin or of Swedes Iron with oval pin, holes drilled through pin and shackles so you can use an ordinary wire nail for key, driving the pin out cuts the nail. All pins are interchangeable. We carry a stock of these in the following sizes, $\frac{3}{4}$ in., $\frac{7}{8}$ in., 1 in., 1$\frac{1}{8}$ in., 1$\frac{1}{4}$ in.

Cant Hook Clasps, made of mild steel or Swedes Iron, forged with heavy jaw. The strongest and lightest band on the market.

Improved "Soo Line" Loading Block, (as per cut above.) This Block has heavy Steel Shell, re-inforced at top with iron billet, through which is riveted swivel, hand forged, of extra heavy swedes iron, also swedes iron link with heavy grab hook, hand ring attached. This hand ring is a practical improvement which every lumberman will appreciate.

Pike Poles **Skidding Tongs** **Saw Wedges** **Hookaroons, etc.** **When ordering from your Jobber, specify "Soo Line" Only**

Made by

Canadian Logging Tool Company Ltd., Sault Ste Marie, Can.

LOGGING LOCOMOTIVES

They have a short rigid wheel base, suitable for sharp curves, and the two wheel trailer truck provides steadiness and smooth riding. A good engine for rough and uneven roadbeds. Has low centre of gravity, hence not "top heavy."

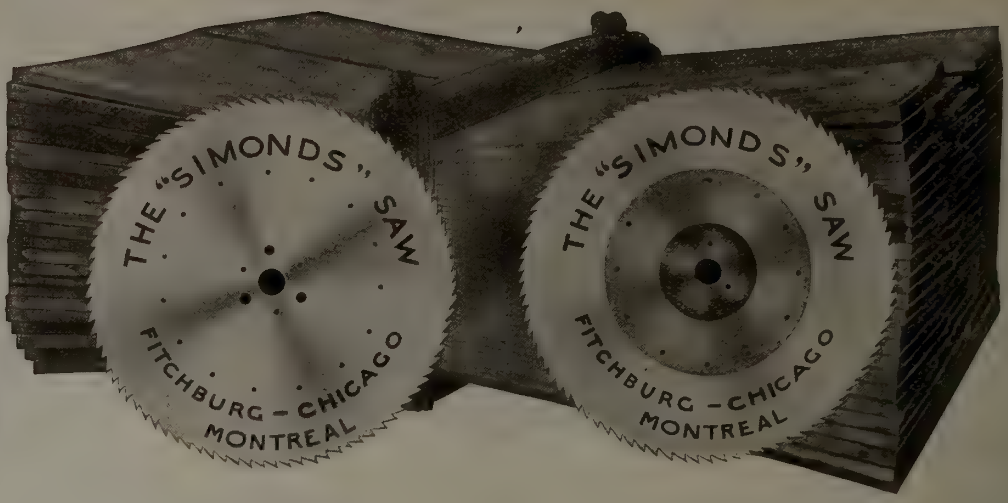
¶ The tank is placed over the boiler, which added weight is available for adhesion. This permits of larger hauling capacity, and gives ample space in rear for carrying fuel.

¶ Adapted to double-ender service. No time lost turning.

MONTREAL LOCOMOTIVE WORKS, LIMITED

BANK OF OTTAWA BUILDING, MONTREAL, CANADA

"I Am Convinced Simonds Shingle Saws Have Saved Me Money"



A man bought nine 40 inch Simonds Shingle Saws. He wanted the best and paid the price. He knows whether he won or lost on the deal.

A careful record of Shingle Saw cost was kept, with the result that after a few months the record showed, in that mill, the saw cost per thousand shingles cut to be slightly less than one-half of one cent. About 9 cent saw cost for twenty thousand shingles.

That is why this Millman said he was convinced Simonds Saws are *money makers* because they are *cost savers.*

This is a statement of fact. We have the proofs and will gladly show them. If you want low cost use the right saws—Saws made of Simonds Steel, made by Simonds Methods. Dollar for dollar value is given. A saw to sell for less money than the Simonds cannot be as good. It cannot run as economically, and it will not make the same profit for you in the long run.

More shingles mean more money from the same block of wood.

For shingle saw prices and particulars, address our nearest office, giving size, number of teeth and guage of saw desired.

SIMONDS CANADA SAW CO., LIMITED

Montreal, Que.

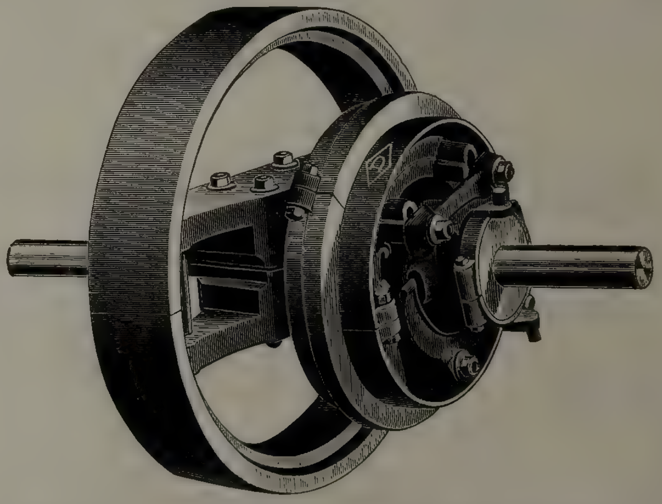
DODGE Split Friction Clutch Pulleys

FOR SAW AND SHINGLE MILLS

POSITIVE - SIMPLE - DURABLE

All parts Interchangeable
Renewable Sleeve
Perfect Balance



Being Split
May be Installed Without
Disturbing Shafting

Made in all Sizes for any Horse Power

Can supply with Wood or Iron Pulleys, and with Babitted or Brass Lined Sleeve. In successful operation all over Canada. Sold under our fullest guarantee.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Vol. 31 **Toronto, May 1, 1911** **No. 9**

The Wholesaler and the Jobber

There is a vexed question which is a bugbear to practically every industry in the land and which in the lumber trade is perhaps as important as in any other. Should a wholesaler receive any better rates from the manufacturer than the commission man or jobber? At first glance one is tempted to say that everyone who will sell a mill's product for it, should be treated in precisely the same manner as the next man who will perform the same service. The question of service, however, is the one which makes all the difference. If the commission man can give the manufacturer the same service as a wholesaler, he is entitled to equally advantageous treatment. It does not often work out, however, that the service supplied by the commission man is nearly so valuable as that supplied by the wholesaler.

In the first place, the wholesaler is interested as much as any one else in maintaining the price of lumber. The better and steadier the demand for lumber continues, the better will be the profits of the wholesaler. His interest in the price is identical with that of the manufacturer. What about the commission man on this ground? He is generally paid so much for a car of lumber sold. If he gets $5 a car in commission he is concerned chiefly in the number of cars he can dispose of. His principle policy is to meet competition at any possible figure, and he becomes a depressing factor so far as prices are concerned, whenever he meets with competition which would under ordinary circumstances prevent him from making a sale. The wholesaler, on the other hand, buys his lumber outright and the manufacturer gets his money without delay. Then the wholesaler has to get a profit on what he has bought, and he helps to keep the price up as long as possible. When the manufacturer again has a large stock to dispose of he finds that in the interval the wholesaler has been acting as banker for the industry and that he has done all in his power to maintain trade at a good level. The commission man, on the other hand, may have been able to keep stocks of lumber moving along into consumption satisfactorily, but at best his influence has been an unsteadying one so far as prices are concerned, while in the matter of payments he makes the manufacturer the banker for the industry.

If the manufacturer furnishes the commission man with lumber at the same price as the wholesaler, he is out the amount of the commission and is supplying the commission man with a means of injuring the market. All commission men are not alike, of course, and there are those who carry on their business with a due regard to the final advantage which they must obtain by a steady demand at good prices. There are others, however, who are not far-seeing enough to consider the final advantage and who think solely of the amount of their commission.

The arguments are strongly in favor of giving the wholesaler the benefit of a better price than the commission man, yet there are instances, none too rare, where this is not done, and everyone in the trade can cite instances in which commission men have been able to sell to wholesalers at a lower figure than the latter have been able to purchase the stock for from the manufacturer.

Dumping Evil Growing Greater

Scarcely a day goes by, in which we do not hear from lumber manufacturers and dealers in different parts of Canada, of the unfair competition which they have to contend with from United States lumber which has been shipped into their markets and offered to consumers at prices which Canadian manufacturers cannot hope to meet. The whole of the evil is comprised in the dumping of foreign lumber on Canadian markets. There is an anti-dumping clause on the statute books of Canada, devised to meet such difficulties, but for some reason or other the Government never ventures to give to the lumber industry the protection against dumping to which it is so clearly entitled on account of the free entry of rough lumber into Canada. So far removed from the protection of Canadian lumber from the dumping of United States lumber, has been the practice of some of the governments of Canada, that from time to time, large orders for lumber for government works or for government aided railroads, are given to United States lumber companies, when equally good lumber could be secured in Canada and when the prices paid for the foreign lumber show clearly that there is no profit being made on the sale. It is a puzzle to lumbermen why they have been so long and so persistently singled out for treatment of this nature and why, in the face of the situation, their demands for a duty on lumber were so systematically neglected. If they secure through the reciprocity arrangements some measure of consideration in this connection it will still be a tardy return for all they have gone through in the past.

The complaint of the lumber manufacturers of Canada against this treatment has been so continuous that those who are not connected with the business have come to look upon it as without foundation. Nothing, however, is further removed from the truth. At this very moment when lumber producers and sellers in all parts of Canada are rightfully hoping to find an active spring demand, the mills and dealers of the United States are flooding Canada with travellers and price lists which demoralize trade on this side of the line. Meeting them on their own grounds, Canadians could handle the competition of United States firms and get away with a large amount of the trade offered, but the price lists, with which the United States travellers in many cases are armed, are calculated to knock the heart out of the trade in Canada.

Take as an example the Manitoba markets. At Winnipeg, lumber from eastern and western Canada comes into competition with that from the western and central States. To-day the manufacturers of eastern and western Canada are quoting prices which would enable them to conduct business at a small profit only. There is great expansion under way in the Prairie Provinces of Canada, and the amount of lumber which will be sold there this year will be enormous. The opportunity for United States firms to work off some of the surplus stock which they continually manufacture is a tempting one, and they are offering lumber to-day in those markets at figures which would mean ruin to any Canadian firm which set out to meet the competition. Washington mills which are selling fir at Winnipeg today are doing so without any fixed price list. It is simply a case of getting the order by hook or crook no matter how low the price.

There are surplus stocks to be worked off in Washington and they must be got rid of at any price, because the continued holding of them in the Washington yards costs money. The loss of profit for the time being enables the mills to avoid the greater loss of the same profit with the cost of keeping the lumber added.

The United States lumber industry is so enormous in its proportions and so badly organized withal, in spite of the flourishing condition of all the lumber associations, that at all times of year there is sure to be extensive overproduction in many sections of the country. Canada has been made the stamping ground for all such manufacturers and Canadian producers of lumber have learned that, in calculating upon their prospects, they must at all times take into consideration this feature of trade. So variable, in fact, are the prices quoted by United States firms on Canadian markets, that if one were to set out to strike an average price, as representing the cost to the consumer of United States lumber on the prairies to-day, it would be an impossibility.

The result of all this is demoralizing. There is an active demand for lumber to-day, but as far as Canadian mills are concerned they are practically forced out of any territory which the United States mills enter. Why cannot the anti-dumping regulation be put into force against United States lumber so that competition in Canadian markets may be based only on the legitimate grounds of cost and quality?

Pulpwood Protection Extended To New Brunswick

It would appear from the reports of the action of the Government of New Brunswick that the measure which has been introduced recently to prohibit the export of pulpwood in an unmanufactured state, is of a very radical nature, and that it will mean in the space of a short time that all wood available for pulp, growing in the province, will be reserved entirely for the use and encouragement of the pulp and paper industry in Canada. Not only will all new licenses or permits be subject to this prohibition but in the renewal of existing licenses and permits, the owners of the same will have to agree to similar terms. As to the question of patented lands granted for settlement, there is at present some doubt, as the references which have been made by the Surveyor-General make no mention of this feature of the case.

It is now more than a year since the legislature of New Brunswick unanimously passed a resolution in favor of the prohibition of the export of pulpwood. During that year the question has been amply discussed in all its features, both by the Canadian public and press and by those of the United States, and it is clear that the Government of New Brunswick will have the support of the people of that province, and that once the measure has been put into active operation it will become the fixed and definite policy of all future governments.

This is the first provincial legislation that has been introduced in Canada, on a subject dealing intimately with an issue included in the reciprocity arrangements, between the United States and Canada. Although its introduction was so long ago foretold, its significance at this juncture is none the less important. The decision of New Brunswick to join with the other eastern provinces of Canada in preserving its pulpwood resources adds one more link to the chain which is being forged for the protection of this important natural resource, and practically makes that chain complete so far as the pulpwood of Eastern Canada is concerned. The action may be interpreted by political parties as having been instigated largely for political purposes. It will probably be denounced by one side as an attack at the reciprocity arrangements, and it may be instanced by others as an argument in favor of the arrangements, in as much as it helps to render nugatory one of the clauses to which Canadians have taken most objection, viz., that providing for free trade in cheap papers. The reasonable view, however, is probably a middle one, because irrespective of any reciprocity negotiations, it was practically certain that the Government of New Brunswick would enact a measure of this nature and that in the near future the people of all parts of Canada would be united against the depletion of their pulpwood resources, for the furnishing of raw material for United States mills. The bearing of the measure upon the reciprocity situation may be ignored, as there is no doubt that whether New Brunswick had adopted such a course or not, Ontario and Quebec would have continued their well understood policies of prohibiting export and thus have prevented any reciprocal arrangements which depended upon a free interchange of pulpwood or its products.

British Columbia also requires that pulpwood cut from Crown lands shall be manufactured within the confines of the Province of British Columbia. British Columbia contains enormous pulpwood resources. It is a matter for congratulation therefore, that there is now presented an unbroken front in favor of prohibition. There will be practically no loop hole for our pulpwood and all that is cut will have to be manufactured in Canadian pulp and paper mills. We may with reasonable certainty look forward now to the rapid growth of the pulp and paper industry which has already made much progress, even in the face of the disadvantages which it has had to put up with in the past. The New Brunswick bill has now been passed by the legislature, and will come into force on October 1, 1911.

United States May Remove Lumber Duty

It is just a year since the people of Canada and of the United States were congratulating themselves upon the solution of the tariff issue and the removal of the danger of a maximum clause being put into force against Canada, and here we are again right in the middle of one of the most important campaigns for the alteration of the tariff that ever came up for discussion between the two countries. A year ago it seemed as though we were at last rid of the tariff issue, and could look forward with some measure of certainty to a period of trade activity undisturbed by tariff considerations. To-day we are apparently as far away from the end as ever and trade on both sides of the line, so far as its international character is concerned, is marking time. The most imperative need of to-day is to have the issue settled quickly and definitely

In the lumber business particularly, the uncertainty has been a cause of much trade disturbance. Something over a year ago Canadian rough lumber going into the United States paid a duty of $2 a thousand feet; to-day it pays $1.25. If the reciprocity arrangements are agreed to the duty will be removed entirely and that upon dressed lumber will be lowered. This will be a good thing for the lumber manufacturers of Canada. Now, however, when the reciprocity considerations are being discussed in every part of the two countries a further and much more radical reduction of duties is proposed by the Democratic party at Washington. This change is nothing less than a complete removal of the duty from all lumber, rough or dressed. The clause of the tariff measure which has been introduced relating to lumber is as follows:

"Timber, hewn, sided or squared; round timber, used for spars or in building wharves; shingles, laths, fencing posts, sawed boards, planks, deals and other lumber, rough or dressed boards, planks, deals and other lumber or lignum vitae, lance wood, ebony, box. granadilla, mahogany, rose wood, satin wood, and all other cabinet woods, Free."

This development throws rather a different light upon the situation. The free list as now proposed will reduce the revenue of the United States by some $10,000,000 annually, yet the party which is responsible for the proposal declares that this sacrifice is as nothing compared with the benefits which will accrue to the people of the United States in the form of cheaper living costs. The inclusion of these articles, lumber in particular, in the free list is said to be a sop to the farmer who is dissatisfied on account of the free admission of Canadian farm products into the United States. This may be the case or not, and it may be that unless the reciprocity arrangement had been introduced there would have been no proposed removal on rough or dressed lumber. It would seem, however, from the readiness with which the Democratic party has swallowed the free lumber proposal, that the sentiment in favor of such a step is widespread, and that in a short time it would have been adopted without any reciprocal inducement on the part of Canada.

This latest move on the part of the Democratic party makes evident the reasonableness of the claim which has been made all along by the "Canada Lumberman" and by everyone else with the interests of Canada at heart, that in the matter of natural resources, Canada, in nearly every case, has the whip hand over the United States, and merely has to wait patiently, standing pat, until the United States comes to the same point of view and decides that for its own best interests, it must admit our products free of duty. The importance of the concessions which Canada is offering in the reciprocity arrangements can only be proven by time. In the present excited state of political feeling it is impossible to estimate them calmly. It is greatly to be hoped, however, in view of the rapid development of free trade sentiment in the United States, that the outcome of events will prove Canada to have given away nothing which it could have retained without unduly sacrificing its own interests.

Editorial Short Lengths for Busy Readers

The question of providing only one standard for hardwood inspection in the United States is occupying the general attention of the trade in that country and it is greatly to be hoped that the object will shortly be attained. The National Wholesale Lumber Dealers Association is taking the subject up, and has issued a circular article to all trade papers regarding the proposed appointment of a special committee on the question.

The advisability of placing the cutting of the timber in the Riding Mountain reserve under the supervision of experienced foresters, themselves under the jurisdiction of the superintendent of forestry, instead of its being cut by farmers and others indiscriminately, occupied the attention of the Forest Rangers' Association at a recent meeting at Saskatoon, Sask. It was decided to install two small mills in the centre of the Riding Mountain reserve in charge of experts, who will see that nothing but the proper timber is cut and that new growth is promoted. The timber thus cut will be sawed into logs at the mill and will be at the disposal of those who wish to obtain lumber. The mills will be worked this season as an experiment, and if success will be adopted by other reserves.

Hereafter the co-operation of the farmers in warning rangers of fires will be asked, and a number of auxiliary rangers will be appointed in different parts of the country near the forests, to act promptly in case of a conflagration when the ranger is in another part of his territory.

"A review of the figures published elsewhere in this issue indicates that to a large extent lumber has been made the 'goat' in the present agreement, and has been traded off for the benefit of the manufacturing interests. The philosophy required to accept this situation with equanimity will probably not be found wanting among the lumbermen, and they will probably find a way to adapt themselves to the loss of protection involved in the agreement with a minimum of disadvantage, and find no small degree of optimism left in the situation. It is but natural that the lumbermen in the north, whose competition with Canada is closer, in the matter of both location and similarity of product, will feel the effects more forcibly, while here in the south the special character of the principal wood, and the consequently less direct competition with northern woods, will make the diminished duties on Canadian lumber a much less important factor. In the matter of location, also, the south is more favorably situated because, while owing to the long distance between the southern and Canadian fields, the intermediate zone of active competition is naturally a wide one, the total cost of delivering lumber due to the higher freight rates makes the difference in duties a smaller factor in comparison, and the ffect of the increased strength of Canadian competition is thus largely dissipated. It would seem, therefore, that the lumbermen of the south, at least, should feel little or no unrest over the prospects of the early authorization of the agreement."—New Orleans, Lumber Trade Journal.

Mr. A. C. Hastings, president of the American Paper & Pulp Association, is confident that when all figures are considered the average cost of print paper will be found to be more than $4.15 per ton in favor of Canadian mills, and puts the advantage down as between $5 and $6 at least. In the cost of raw material Canadian mills have a benefit of $5 per ton of paper. Rates of wages are claimed to be much higher in the United States. Mr. Hastings says the gist of his report, so far as it goes, is:

"First—That every mill in the United States pays more for pulp wood than the average cost in Canada, and the average difference is indicated to be nearly $4 per cord.

"Second—That 76 per cent. of ground wood pulp costs more to make in the United States than the Canadian average cost, and that the average United States cost is $5.64 per ton more than the Canadian.

"Third—That 85 per cent. of the United States sulphite fibre costs more than the Canadian average, and that the United States average cost is $7.61 per ton more than the Canadian, and

"Fourth—That 77 per cent. of the United States news print paper costs more to make than the Canadian average, and that the United States average cost is $4.61 per ton more than the Canadian average."

Herbert Knox Smith reports on February 13, 1911, to President Taft, that 88,579,000 acres of timberland in the United States are owned by only 1,802 parties; and that 195 "holders" are in possession of 48 per cent. of all timber privately owned in the Pacific northwest (including Montana, Idaho, Washington, Oregon, California), in the southern pine region and in the lake states. Mr. Smith "discovers" in his report: "The concentration of a dominating control of our standing timber in a comparatively few enormous holdings, steadily tending toward a central control of the lumber industry." Let us hope, in the interest of American forest conservation, that Herbert Knox Smith is correct! Conservative forestry has never been practiced by the small owners, neither in America nor in Europe. A dominating control is required of far-sighted financiers, public or private, over the timber left standing. This control must fix the price of the timber so high that it will pay to reproduce the timber. Conservative forestry, where it exists, depends on large holdings of timber land, the major parts of which (viz., the parts not ready for the axe) are held for dozens of years "in advance of any use thereof." Conservative forestry as a business can yield a dividend sufficient for the owners of forests only where and as long as the price of stumpage increases automatically. Again, let us hope. . . that Mr. Herbert Knox Smith is correct!—C. A. Schenck, Ph.D.

"Lumbermen in the east are anxious that the reciprocity agreement be ratified," said Mr. Alex. Maclaren, the well known lumberman of Ottawa, in a recent interview. "They realize that the result of the proposal cannot but benefit them. Under the present arrangement, the United States has free access to the timber markets in Canada, a privilege not mutual, and hence there is more lumber coming over the border to the northwest at the present moment than we Canadians are shipping to the Americans. There is also a great deal of lumber entering Ontario and Quebec from the United States. This material is mostly southern timber. With the ratification of the reciprocal arrangement, the markets of the United States will be free to the Canadian lumbermen—an unquestionable advantage. There is no danger of our pulp areas being ravaged by the Americans. With the tariff even as it now stands, there is a great call for the product by the paper consumers of the republic. There is no reason why any tariff damper should be placed upon the exportations of the semi-manufactured article. The Fielding-Taft arrangement will benefit us, and hence will benefit the Canadian people directly."

Australian Imports of Canadian Woods

Totals Show Increase Although Imports From All Countries Decreased in 1909—General Outline of Trade Customs and Requirements

The Canadian Trade & Commerce reports in a recent issue contain a valuable outline of the lumber trade of Australia, so far as it concerns Canadian products. The following information is taken from the report:

The 1910 trade returns of the Commonwealth of Australia will not be available for several months, hence comparisons of imports can only be made at present with the two previous years. While the total value of the Australian imports of timber substantially decreased in 1909, as compared with 1908, it is satisfactory to observe that the imports from Canada increased by £48,124.

The values are shown as follows:

Imports from Canada in 1909	£84,849
Imports from Canada in 1908	36,725
Increase, 1909	£48,124

In the Canadian trade returns for the year ended on March 31, 1910, the value of the exports of lumber to Australia is given at over £101,000, so that the Australian figures are only approximate. While shipments of British Columbia timber are made by San Francisco brokers, and are invoiced on their invoice forms, the United States will continue to be credited, in the trade returns of the Commonwealth (as the country of origin), with some of the shipments of Douglas Fir from British Columbia ports.

The value of timber imported by the Commonwealth of Australia in 1908 and 1909, was £1,909,872 and £1,653,817 respectively.

Definition of Lumber.

Lumber is invariably defined at timber throughout Australia and this word applies to hewn, sawn or dressed timber. In general terms it may be stated that hewn timber is not imported into the Commonwealth from the Pacific Coast. Specifications call for every thickness from 2 to 20 inches, by widths of 3 to 24 inches, but the average size of Oregon required is about 12 x 6 inches or its equivalent.

Douglas Fir or Oregon Timber.

Probably no imported timber is better known in Australia than Douglas fir, which is popularly known as "Oregon." It is imported in all sizes but, on account of the customs tariff, sizes bulking 12 x 6 inch and up are mostly in demand. Purchases of cargoes are based on the current schedule isued by the Pacific lumber inspection bureau, which furnishes a standard for the relative values of different grades and dimensions as well as a basis for the quotation of prices. This schedule governs all "Oregon" from the Pacific coast including the Fraser river. The timber is sold at the basis price c.i.f (cost, insurance and freight), or ex-ship's slings, at principal Australian ports. Sizes other than those on the basis being invoiced, as the case may be, at increased or reduced prices, therefore all quotations ar framed on the basis rate. The certificate issued by the Pacific Lumber Association must accompany invoice and shipping documents.

Practically all the Oregon shipped to Australia is rough merchantable quality with a quantity of mining lumber. Occasionally a higher grade is asked for such as "Select" which is sold at a considerably higher price than merchantable. Very rarely is "Clear" timber asked for, which is still more expensive, but the leading importers agree that about 95 per cent. of the "Oregon" used in Australia is the merchantable grade.

Mining Timber.

There is a large quantity of No. 2 merchantable "Oregon" imported for the famous silver mines at Broken Hill, N.S.W. This timber is discharged at the nearest port to the mines which is Port Pirie, South Australia. Mining timber is generally sawn to 10 x 10-inch, which size comes in at the lowest rate of duty, and it is afterwards resawn at Broken Hill to the sizes required.

The oversea quotations for "Oregon" to Australian ports vary considerably. Distance, port expenses, and if the ship or steamer can obtain an outward loading at port of discharge are important factors in submitting prices. This is reflected in the latest wholesale quotations c.i.f. and e. (cost, insurance, freight and exchange or cost ex-ship's slings) principal Australian ports, which—upon the basis of 1,000 feet board measurement—are as follows:

Merchantable Oregon, c.i.f. & e., Sydney, 78s. to 80s. ($18.98 to $19.46.)

Merchantable Oregon, c.i.f. & e., Melbourne, 80s. ($19.46.)

Merchantable Oregon, c.i.f. & e., Adelaide, 86s. to 89s. ($20.92 to $21.65.)

Specification for Cargoes of Spruce.

The States of Victoria and South Australia take nearly all—if not all—the spruce shipped to the Commonwealth. In submitting quotations for cargoes of spruce to Australian importers it is necessary to give the following particulars, otherwise offers will not be considered, viz.:

1. The average lengths of spruce deals.
2. The fall of widths.
3. Percentage of Nos. 1, 2 and 3 grades.
4. Reduction for ends, 4ths and scantlings.
5. Time when Canadian port of shipment is open.
6. Discount and brokerage rebates.
7. A guarantee that timber is well seasoned prior to shipment.
8. An undertaking to be given that deals are cut full widths and thickness, free of wane, as all have to be re-sawn again.

Usual Specification Particulars.

The usual specification and particulars of sizes and percentage of quantities of spruce deals in sending orders from Melbourne are as follows:

Sizes	Quantities.	Sizes.	Quantities.
6 x 3	10 per cent.	9 x 3	30 per cent.
7 x 3	15 per cent.	10 x 3	20 per cent.
8 x 3	10 per cent.	11 x 3	10 per cent.
12 x 3	5 per cent.		

Spruce of above sizes is termed deals, and the reason no small boards are imported is that timber in sizes of 7 x 2½ or under (or its equivalent) is subject to higher customs duties. Small quantities of clear spruce are imported for scull and oar making.

Terms of Purchasing Spruce.

All spruce imported is rough sawn and, owing to high customs duties, care must be taken in shipment that the timber is full measurement. Spruce is purchased upon the basis of the "St. Petersburg standard" of 1,980 superficial feet in first, second, third and fourth qualities, but the average shipped to Australia is second quality. Short lengths from 6 to 8 feet (known as ends) are invoiced at one-third less rates than longer timber. Fourth quality spruce is sometimes imported and is invoiced by shippers with an allowance of £1 ($4.87) per standard. In a full cargo about 12½ to 15 per cent. of fourth quality is frequently specified.

Recent quotations for spruce averaged £7.10.0 to £7.12.6 ($36.49 to $37.10) per standard, less 2½ per cent. Freight to Melbourne being in the vicinity of £2.7.6 ($11.55) per standard. Spruce should be well seasoned before shipment, otherwise it will sweat and turn black in transit. Masters of vessels carrying spruce should be instructed to open the hatches whenever the weather is favorable.

Freighting from Oversea.

Until quite recently shipments of Oregon and spruce always came forward by sailing vessels—spruce with rare exceptions continues to come by sailers—but large tramp steamers carrying between 3,000,000 and 4,000,000 feet of Oregon have practically secured this trade.

The principal lines of dressed timber imported into Australia come from Norway and Sweden and is composed of Baltic flooring, lining and weatherboards. The importations in 1909 were 55,830,241 feet valued at £364,455. Of this quantity Canada is credited with only £591 and the United States with $15,985 which woud be in clear pine shelving and tongued and grooved boards.

Laths, Shingles and Staves Undressed.

Imported laths are generally stowed between the deck beams of sailing vessels and steamers and in odd corners where it is impracticable to stow timber. In 1909 the United States and Canada supplied all Australian laths to the value of £16,323 and £4,647 respectively. The United States supplied all the shingles of which the value was only £1,873. The demand for the latter line is very limited and scarcely worth the attention of exporters, except to "fill up" the stowage of cargoes.

That undressed staves are receiving the attention of Canadian exporters is evidenced by the fact that in 1909 some 973,000 staves were shipped to Australia to the value of £4,760, and this trade has only just been entered into. The United States supplied 1,114,169 staves, to the value of $10,845. The total imports were 2,390,888 staves, valued at £18,178.

The imports of pickets remain practically stationery, Canada and United States supply all Australian requirements. The value of the trade in 1909 was only £4,117.

There is a constant demand for hickory, which would be largely imported were it possible for Australian dealers to secure to desired qualities at a fair cost. There is no separate classification in the Commonwealth trade returns showing the extent of this business, but inquiries are always being made at this office for Canadian sources of supply.

During the last few years oak timber has become very popular in Australia for the manufacture of furniture. There is a steady demand for standard qualities upon which dealers can rely and this trade should be worth the attention of Canadian specialists in this line. Particulars concerning oak and oak mouldings sent to this office together with wholesale f.o.b. steamer Montreal or St. John prices will be distributed in the best channels.

Discharging at Australian Ports.

In Sydney timber is generally discharged in the stream into lighters; buyers taking delivery ex-ship's slings. There are a few wharfs owned by timber merchants alongside of which vessels may lie and discharge cargo. The daily discharge from sailers is about 70,000 feet board measure and from steamers up to 200,000 feet. Steamer charterparties generally stipulate for the daily discharge of not less than 150,000 feet board measure.

The cost of stevedoring a cargo of Oregon is about 1s.9d. per 1,000 feet. Wharfage dues are 1s.8d. per 600 superficial feet, and owners of private wharfs pay harbor dues of 10d. per 600 super. feet when discharged on their wharfs. Towage is entirely a matter of arrangement which is less in Sydney than other Australian ports. Lighterage from the stream to buyer's yard may be taken at 5s. per 1,000 feet board measure including cost of labor on the lighter.

All timber coming to this port is purchased on the basis of ex-ship's slings at one of the Melbourne wharfs. The daily discharge averages 70,000 feet for sailers and up to 200,000 feet for steamers. Towage is expensive for sailers as Port Phillip entrance is 45 miles distant from the city. With an unfavorable wind, it is imperative to engage a tug and, on an ordinary vessel, this would amount to about 5d. per ton. The pilotage inward, or outward, on sailers is 4d. per ton, with a maximum of £34 or a minimum charge of £5, but if ships are towed the rate is reduced to 2d. per ton or £10 maximum and £4 minimum. Steamers pay 2¼d. per ton up to 2,000 tons and for every additional ton ½d. or a maximum of £26 5s. Quayage is ½d. per ton registered for the first six days and ¼d. per ton per day afterwards.

There is no difficulty in berthing steamers carrying up to 3,500,000 super feet of "Oregon" alongside Port Adelaide wharfs. Unloading is similar to Sydney and Melbourne, i.e., up to 200,000 feet daily. The pilotage on a steamer carrying a cargo of over 3,000,000 feet would (in and out) be £21, whereas the tonnage dues are 1½d. and the light dues 6d. if full, or 3d. per ton if only part cargo. Towage (in and out) if required, would be about £20.

Relative Importance of Australian Timber Ports.

Sydney is undoubtedly the most important timber market in Australasia. From private sources, it is estimated that the total imports of "Oregon" into New South Wales in 1910 were over 57,000,000 superficial feet. The Melbourne imports of "Oregon" in 1910 are given at slightly over 20,000,000 feet and of spruce at 4,558,000 feet. The figures relating to importations of "Oregon" in 1910 at Adelaide are not available, but probably 1,400,000 feet of spruce were landed at that port.

In every Australian port, there are telegraph and cable offices which offer the same facilities as similar offices in Canada and elsewhere. The cable rate, by the Pacific cable, from all parts of the Commonwealth to all parts of Canada is 2s. 4d. (57 cents) per word. Practically every port at which timber is discharged has railway connection whereby timber can be despatched to points in the interior. A fine fleet of passenger and cargo steamers trade on the Australian coast, which gives every convenience for transferring timber from port to port.

Payment for Oversea Shipments.

When an order is sent from Australia to Canada or the United States, it is the recognized terms of the trade to support the specification with a banker's letter of credit which is negotiable when the ship is loaded and bills of lading and insurance policy are attached to the invoice and draft. This practically means a cash transaction for the shippers. Freights are generally made payable at Australian port of destination, and shippers, if instructed, can make an advance to the master of the steamer or sailer, which amount is included in the draft upon the consignees.

Frequently Australian direct importers or agents for oversea timber mills—while in their case purchasing cargoes on a letter of credit basis—dispose of the timber to local saw millers and accept settlement in approved promissory notes at 3, 4, and even 5 months, with bank account added. In some instances a sale is effected upon a cash basis, either net or subject to 3 per cent. discount according to arrangement. In the principal ports, a number of the timber mills import cargoes direct from oversea and require no credit accommodation. The retailer generally gives 2½ per cent. in 30 days' or 3¾ per cent. discount for prompt cash.

Nearly all the orders are obtained by agents who submit cabled quotations from their principal to buyers, and orders are placed in a similar expeditious manner. Some British Columbia and eastern Canadian timber mills have representation in Australia.

Local knowledge is essential and resident agents are alert to the requirements of the various importing centres within the Commonwealth. Specifications are coded in many forms and to suit the probable orders received from individual buyers, as well as covering the general orders placed for each particular port. It may be said that capable agents are essential to secure business and to maintain the connection once obtained.

Cost of Pulp and Paper in Canada and the United States

The data furnished by President Taft from the Tariff Board in response to the resolution of Senator Cummins on cost in Canada and the United States, of articles in the reciprocity agreement, are most complete on paper and pulp. The table which summarizes all the returns from both Canada and the United States, shows a wide variation as to cost of wood and pulp, the advantage being with Canada. Here is the table of costs of production for one ton of pulp and news print paper in the United States and Canada:

	Lowest.		Highest.		Average.	
	U.S.	Can.	U.S.	Can.	U.S.	Can.
Ground Wood Pulp.						
Wood	$ 7.33	$ 5.74	$15.01	$ 9.71	$10.64	$ 7.07
Manufacturing labor	.98	1.50	3.78	2.46	2.12	1.93
Other cost	.29	.82	7.00	3.30	2.02	2.14
Total cost in bulk, mills	10.13	9.57	20.07	14.72	14.78	11.13
Sulphite Pulp.						
Wood	13.28	12.02	25.89	18.04	19.08	14.32
Manufacturing labor	2.09	2.87	4.83	5.45	3.63	4.15
Other cost	7.48	7.29	13.02	9.51	10.01	8.87
Total cost in bulk, mills	24.11	24.09	38.43	33.00	32.72	27.33
News Print Paper.						
Ground wood pulp	7.79	7.18	18.54	10.88	12.61	9.22
Sulphite pulp	6.31	3.71	13.89	8.54	8.43	6.50
Manufacturing labor	2.19	2.97	6.06	3.55	3.25	3.25
Other cost	5.75	8.44	11.63	10.12	8.24	9.42
Total cost in bulk, mills	25.38	25.17	39.57	30.27	32.53	28.38

It will be seen that the lowest cost in United States mills is only 11 cents a ton more than the lowest cost in Canadian mills. The highest cost in United States mills is $9.30 more than the highest cost in Canadian mills. The difference in the average cost a ton is $4.15 in favor of Canada, to which must be added the longer rail haul from Canada to the United States when the paper from that country comes into competition with the American product.

Large Cut in Colchester County, N.S.

An experienced operator in Colchester County, Nova Scotia, estimates that the cut of lumber in that county during the past winter will total nearly 60,000,000 feet. The estimate is made up as follows:

Two conditions are given as responsible for the large output; first, the good market for lumber; and, second, an ideal season for operating.

	Feet.
Atkinson, at Union	7,000,000
Hill Bros., North River and DeBert	7,000,000
Primrose Bros., Riversdale	5,000,000
Dickie, Stewiacke	4,000,000
Soy, Kemptown	4,000,000
Glennie, Brookfield	3,000,000
Barnhill, Belmont	3,000,000
King, Greenfield	2,000,000
H. H. Johnson, Harmony	2,000,000
Wm. McKenzie, Kemptown	2,000,000
Sutherland, Kemptown	2,000,000
J. S. Swan, DeBert	2.000,000
Emery, Truro	1,000,000
Main, Brookfield	1,000,000
H. McLean, Union	4,000,000
J. Creelman, Bass River	1,000,000
R. Starratt, Bass River	250,000
Crowe Bros., Bass River	250,000
S. Starratt, Bass River	250,000
L. Starratt, U. Economy	500,000
S. Fletcher, U. Economy	250,000
L. Marsh, C. Economy	1,000,000
R. P. Soley, L. Economy	500,000
McLellan Bros., L. Economy	250,000
L. Pugsley, F. Islands	2,000,000
L. Pugsley, Portaupique	1,000,000
M. Fulmer, F. Islands	1,000,000
Small operators, F. Islands	1,500,000
R. Black, Lornvale	500,000
Vincent, Westchester	500.000
Giddens Bros., L'derry Sta.	250,000
Starratt, Castlereagh	250,000
Smaller operators in Co.	5,000,000
	58,250,000

Preparations are well under way for the annual meeting of the National Lumber Manufacturers' Association, which is to be held on May 24 and 25 at the Congress Hotel, in Chicago. The meeting promises to be unusually well attended and to present for the consideration of the lumber industry in an effective way a number of subjects of great importance.

One hundred and fifteen locomotives on the Great Northern Railway will be equipped with oil burners that crude oil may be used for fuel. This follows the recommendations of the Forest Service and the forest fire associations of the Pacific northwest. It has been stated that a very large proportion of the forest fires of recent years have resulted from sparks from railway locomotives, and in taking this action the Great Northern is doing its part to reduce the annual loss of timber by fire.

Fourteen Kittens Shown the Light

Vicegerent Patterson Conducts Successful Concatenation at Hamilton, Ont.—Visiting Members Assist in the Work

Word went forth among the dwellers in Hoo-Hoo land of Eastern Canada, early in the month of April, that on the 21st of that month there would be held at Hamilton, Ont., a Concatenation of the Order, which would be an eye-opener, not only to the benighted dwellers in outer darkness who sought admission to the promised land, but also to the oldest inhabitants who were fortunate enough to be able to attend in person. Vicegerent T. Patterson, of Hamilton, was the "moving" spirit of the occasion, and he managed, with the aid of some of the most celebrated brethren of the Order, to keep things on the go from the beginning until the end. His task was lightened greatly by the sprightly demeanor of the ambitious kittens who applied for permission to be shown the light of Hoo-Hoo land.

There must have been a Friday bargain sale of cat-nip at Hamilton that day, as nothing else could account for the genial good humor and patient contentment which the kittens exhibited during the trying ordeals that were necessary before it could be truly ascertained that they were fitting and worthy to be admitted to membership in the great Order.

There were fourteen in all of these fortunate kittens when the proceedings were commenced at the Waldorf Hotel, and their behavior was emphatically and favorably commented upon by all who were fortunate enough to be entrusted with the honorable duty of being in charge of their personally conducted tour through the realms of darkness into the land of light. In addition to the Vicegerent, those who officiated were: Senior Hoo-Hoo, J. L. Campbell, Toronto; Jaberwock, L. E. Fuller, Chicago; Junior Hoo-Hoo, J. B. Webb, Grand Rapids, Mich.; Custocatian, A. E. Gordon, Toronto; Arcanoper, G. M. Ingram, Toronto; Scrivenoter, Jesse Tilley, Hamilton; Bojum, C. H. Taylor, Hamilton; Guerdon, E. Palmer Kinsman, Hamilton. Other distinguished members of the Order were present in the persons of Mr. W. A. Hadley, Chatham, Ont., member of the House of Ancients, and Mr. Wm. Stephenson, travelling representative of the Concatenated Order of Hoo-Hoo. It is needless to enlarge upon the splendid manner in which all the details of the difficult event were managed to the entire satisfaction of most of those who were concerned. With such a body of experienced members it was a foregone conclusion that everything would be attended to in the most approved and thorough fashion.

The business of opening the eyes of the kittens occupied the attention of these skilled officers until midnight, and the members, old and new, then sat down to an ample session-on-the-roof, as all needed refreshment. When the repast had been attended to in the same thorough manner as the preceding events, an interesting programme of music and speaking was carried out. From the lips of the visiting members, a world of good advice was received and encouraging reports were given of the progress of the Order in other lands. When daylight was fast approaching the work had all been conscientiously performed and the event was concluded with "God Save the King" and "Auld Lang Syne."

Ontario and Quebec Tie Production

About Two and a half Million Taken Out During the Past Winter—Prices Remaining Steady

The past winter's tie output throughout the Provinces of Ontario and Quebec was large. The quantity is estimated by dealers to be about two and one-half million. The season was most favorable for tie making, with sufficient labor at reasonable wages. The largest percentage of the ties are cedar and jack pine, although considerable hemlock has been made and some tamarac; also a quantity of spruce was taken out for construction work on new lines, although this class of ties has a short life in track.

The prices are about the same as the 1910 figures, cedar running up to forty cents each, tamarac at varying prices up to 38 cents, and hemlock and jack pine 30 to 33 cents. The ties are nearly all sawn, as experienced tie hewers are scarce and the boards and shingles made from slabbing ties at mills considerably reduce the cost of making.

The railway companies, it is understood, are seriously considering the advisability of installing large plants in Canada at central points for the treatment of track ties. In this connection the C.P.R. Company has already established a large creosoting plant at Winnipeg. The supply of tie timber is not so large as is generally thought, and as the cost of chemically treating ties is not great, while the life of the tie by the best treatments is increased from 25 to 75 per cent., according to the class of timber, the railway companies are beginning to see the vast economy of preservation treatment as well as the means of lessening the annual drain upon the forests now so urgent, and thereby preserving the future supply.

Fence Posts—For railway fencing in Ontario and Quebec, about half a million of these, it is estimated, have been made during the past winter. These are nearly all of cedar, the price of which varies according to locality from nine cents to eleven cents each.

Cedar Poles—The output of poles for 1910-11, in Ontario and Quebec, is figured by pole dealers, to be about 200,000 pieces, varying in lengths from 20 to 65 feet, and from five to seven inches at the top end. Seventy-five per cent. of these poles are 30 feet and under in length. The prices run as follows:

20 feet long, 5-inch top, 3 cents per lineal foot.
25 feet long, 5-inch top, 3 cents per lineal foot.
25 feet long, 6-inch top, 4 cents per lineal foot.
25 feet long, 7-inch top, 5 cents per lineal foot.
30 feet long, 6-inch top, 5 cents per lineal foot.
30 feet long, 7-inch top, 6 cents per lineal foot.
35 feet long, 6-inch top, 7 cents per lineal foot.
35 feet long, 7-inch top, 8 cents per lineal foot.
40 feet long, 6-inch top, 8 cents per lineal foot.
40 feet long, 7-inch top, 9 cents per lineal foot.
45 feet long, 7-inch top, 11 cents per lineal foot.
50 feet long, 7-inch top, 12 cents per lineal foot.
55 feet long, 7-inch top, 14 cents per lineal foot.
60 feet long, 7-inch top, 17 cents per lineal foot.
65 feet long, 7-inch top, 22 cents per lineal foot.

Eighty-five per cent. of the poles produced in these sections are used in Canada. The shorter poles are now in considerable demand for rural telephone lines, of which there are a great number being built in eastern Canada. The Hydro-Electric activities in western Ontario, together with their municipal connections, have opened up a new market for cedar poles of the best grades; these lines accepting only poles of superior quality. Canadian cedar poles of 35 feet and over, with tops of seven inches or more, find a good market in the United States, but the poles shipped across the border must be of the very best quality; the high freight, plus the duty, precludes the shipping of any inferior or even ordinary stock over the line.

Toronto Man Buys Alberta Sawmill and Limits

Major A. G. Peuchen, president of the Standard Chemical Company, of Canada, has bought out, on his own account, the entire lumber business in Alberta, belonging to Senator Peter McLaren. The purchase price was in the neighborhood of $500,000. Major Peuchen takes control of the business from May 1st. The property purchased includes a mill at Blairmore, with a capacity of about 10 million feet per year; 140 square miles of timber, containing in the neighborhood of 400,000,000 feet of high class spruce and jack pine; 48 square miles of burnt-over timber and 7,000 acres of ranch land with about 250 head of horses, which are used in connection with the company's camp operations; and lumber yard at Blairmore, Macleod, and elsewhere.

Major Peuchen states that he intends to erect another mill similar to the one at Blairmore. One-half of the limits which he has purchased are on a separate watershed and make the building of a new mill necessary. He has already indicated to the council of Macleod that he would be ready to locate the mill at that place if they would encourage him by way of a bonus or by constructing a mill pond satisfactory to his engineers. He is also considering the advantages of Lethbridge for the new mill.

Major Peuchen is very optimistic about the outlook for the lumber business in Alberta. The spruce which is manufactured at his mill is very highly thought of throughout the prairies. It is claimed that it is only one-third of the weight of the lumber which is cut a few miles westward in British Columbia, and that it dries within three weeks in the air as thoroughly as British Columbia kiln-dried lumber. Upon the burnt-over section of the limits, the timber is used for coal mine props, etc., and finds a good demand for this purpose. There are now 10 million feet of logs in the river adjoining the Blairmore mill.

W. H. Martin, Limited, retail lumber dealers at the corner of Danforth Road and Chester avenue, Toronto, held a meeting of their creditors on April 20th, in the offices of Messrs. Hall & Payne, Richmond street, Toronto. Three inspectors were appointed, namely, Messrs. H. P. Whitesides, Toronto; John Jarvis, Toronto, and R. A. Laidlaw, Toronto, who investigated the situation of the company, and reported at a meeting on April 21st. They found that the business was in an unsatisfactory condition, and it was decided that Mr. Martin should make an assignment for the benefit of his creditors.

A decrease of one billion feet in the total production of timber in the State of New York during the past year is reported by the State Forest, Fish and Game Commission. "It apears," says the commission, "that there has ben an increase in the consumption of pulpwood grown in the State, but quite a large shrinkage in the production of lumber. There are 1,640,000 acres in round numbers in the forest reserves, and the amount of timber standing on the same is estimated at 14,000,000 feet board measure."

A Progressive Ottawa Lumber Firm

Bartram Brothers, Limited, Incorporated in 1909—Already Doing a Large International Trade—In New Quarters

We take much pleasure in presenting to our readers herewith. photographs of the president and secretary-treasurer of the well known firm of Bartram Bros., Limited, wholesale lumber dealers, Ottawa, Ont. This company was incorporated in 1909 from a business which had been founded by Mr. W. B. Bartram, about 10 years ago. They handle and control the entire outfit of several sawmills, which they distribute throughout Eastern Canada and the United States. The principal lines of lumber which they handle are white pine, spruce and hemlock.

Mr. E. T. Saxe, president of Bartram Bros., is the son of a lumberman who conducted a successful business at Albany and Troy, New York, and he has been identified with the lumber business for many years, dating back to the time when these two ports were largely the distributing points of the eastern part of the United States. From this it will be realized that he has a very thorough knowledge of the lumber business as required in the United States. Not only is he well known in lumber circles, but he belongs to one of the oldest families in New England, representatives of which have figured prominently in the national progress of the United States from a political, literary, and art standpoint.

Mr. W. B. Bartram, secretary-treasurer of the company, is well known to most lumbermen in Eastern Canada and the United States. He has ben identified continuously, for the last 20 years, with the lumber business, having worked through all its branches in the woods, sawmills, and planing mills, and having made a careful study of conditions abroad.

E. T. Saxe, Montclair, N.J.

W. B. Bartram, Ottawa.

Messrs. Bartram Bros. are therefore well equipped to give excellent service to their customers. They make a particular point of assisting and advising their customers as to the best lines for their particular requirements. They are fortunate in having upon their list of customers, many of the best accounts in Eastern Canada and the United States. They are confident that the lumber business this year will be better than ever before, and are making their own plans for an increase of 50 per cent. in their business totals. On account of their rapidly increasing trade they have found it necessary to move into new quarters and henceforth will be found in the Hope Building, on Sparks street, Ottawa. The company have an excellent selling organization and they cover all the important lumber centres of Quebec, Ontario, New York States, Connecticut, and Massachusetts.

Mr. Walter Laidlaw, the well known member of R. Laidlaw & Company, Traders Bank Building, Toronto, who has been abroad during the last seven months, sailed for Canada on the Celtic on April 29th. Mr. Laidlaw has had a most enjoyable trip throughout the old world, during which he visited among other places, the Mediterranean, the Suez Canal, India, China, Japan, Siberia, Moscow, Pienna, Paris, and London. Mr. F. A. Laidlaw, of the same firm, will visit England during the coronation. He will sail on June 3rd, with a party of friends, and will be away for about six weeks.

Mr. Arsen Robitaille, a partner in the firm of Messrs. Lawrence & Robitaille, lumber merchants, of Montreal, died of heart failure on April 18th. Mr. Robitaille was 37 years old.

World's Forest Resources

A bulletin of the United States Department of Agriculture recently issued contains the following information relative to the forest resources of the world:

The forests of Europe occupy an area of 750,000,000 acres, about 31 per cent. of the total land area of the continent. The most wooded country is Finland, followed by Bosnia and Herzegovina, and Sweden; the least wooded countries are Portugal and Great Britain. The proportion of forest area decreases from the north and east of Europe towards the south and west. Russia, Finland, Sweden and Norway together possess 583,000,000 acres of forest, or 78 per cent. of the total forest area in Europe.

European Forest Areas.

The following table shows the area under forest, the percentage of the total land area under forest, and the forest area per capita for most of the European countries:

Country	Total forest area. acres.	Forest area per capita. acres	Land area under forest. per cent.
Russia—			
European Russia	464,611,000	4.3	36.3
Finland	52,500,000	18.75	54.4
Total	517,111,000		
Austria-Hungary—			
Austria	23,996,000	.92	26.5
Hungary	18,692,000	1.17	25.7
Croatia and Slavonia	3,769,000	1.64	35.95
Bosnia and Herzegovina	6,380,000	3.99	50.5
Total	52,837,000		
Sweden	49,390,000	9.7	48.6
Germany	34,990,000	.62	25.89
France	24,021,000	.61	18.5
Norway	16,848,000	7.0	21.0
Spain	(?)16,065,000	.88	13.0
Italy	10,115,000	.31	14.28
Bulgaria	7,603,000	2.4	30.0
Roumania	6,367,000	1.08	18.0
British Isles	3,030,000	.10	4.0
Switzerland	2,140,000	.67	20.6
Belgium	1,304,000	.2	17.7
Servia	3,865,000	1.55	32.0
Other countries	4,427,000		
Grand Total	750,113,000		

Of the forests of non-European countries, except in a few localities, little is known either as to the quantity or the quality of the timber. The following table shows the extent of the forest area in countries outside Europe, so far as is known:

Country	Forest area. Acres.	Proportion under forest of total Land area. Per cent.
Asiatic Russia	348,030,000	....
India	149,000,000	24.0
Ceylon	6,763,000	
Japan	57,718,000	
Philippine Islands	49,000,000	
British Australsia	126,720,000	19.8
Cape Colony, Natal, Swaziland and Transvaal	641,000	
Madagascar	25,000,000	19.0
Barbary States	9,527,000	
Central Africa	224,000,000	
South America (tropical)	528,000,000	
West Indies	42,699,000	66.6
Canada	799,360,000	38.0
Mexico	25,000,000	5.1
Alaska	107,000,000	
United States of America	545,000,000	29.0
Certain other countries*	6,870,000	
Total	3,050,298,000	

*Malay States, Straits Settlements, Cyprus, Java, Hawaiian Islands and Mauritius.

Figures Largely Approximations.

The total forest area of the world, so far as shown in the above tables, is over 3,800,000,000 acres. To this should be added the area of the forests of China, Corea, extra-tropical South America, and parts of Africa, for which there are no available data.

All figures for forest areas are more or less approximations. While the figures for the forests of Austria-Hungary, Germany, France, Sweden, Norway, Finland, Belgium and Switzerland may be regarded as fairly accurate, those for the Russian, Canadian and United States forests are only quite approximate. The immense forest areas in Russia, the United States and Canada include a large proportion of land at present unproductive, such as swamps, burns or lands which sooner or later will be taken up for agriculture, as well as forest land proper. As to the figures showing the percentage of forest land to the total, it must be borne in mind that the proportion of forests to total land area varies greatly in different parts of the same country.

A Progressive Calgary Lumber Company

The Riverside Lumber Company, Limited, Calgary, Alta., which has recently been reorganized with a capital of $500,000, has a sash and door factory at Calgary equipped with the most modern machinery, and the company has a reputation which is second to none in the west. So rapidly has its business increased that, in order to keep up with the demand, it was lately found necessary to make important additions to the plant. This is now sufficiently equipped to cope with the large volume of busines which the firm receives. Experts are employed in all departments, and the company take great pride in the excellence of their factory work. Throughout the winter the factory was running to full capacity in order to fill a number of large contracts, and to be in readiness for the spring trade. During the present year, many large buildings are to be erected in Calgary, notably the Hudson's Bay Company's departmental store, at a cost of a million and a half dollars. The contracts for many of these buildings have been placed with the Riverside Lumber Company, and they therefore find themselves already justified in the extensive alterations they have made to their plant.

Riverside Lumber Co., Calgary—South View of Sash and Door Factory.

Riverside Lumber Company, Calgary—North View, Showing Section of Plant and Yard.

Besides the sash and door factory at Calgary, they operate two yards in the city, and a stock of six million feet of lumber is carried. They have also branches at Bassano, Langdon, Strathmore, Lethbridge, New Dayton, Diamond City, and Magrath. The prospects for a very busy season are of the brightest, as the weather conditions for a good crop have been unusually favorable. The large influx of new settlers has created great activity in the building trade, and new towns are opening up daily.

The company also operate their own sawmills at New Michel and McGillvray, B.C. These mills were running all winter, and manufactured a large stock of lumber in readiness for the spring trade. Large crews of men were engaged in their logging camps and over 10 million feet of logs were taken out.

The majority of the shareholders in the Riverside Lumber Company are practical men who thoroughly understand all the branches of the business.

Cushing Brothers' New Plant at Saskatoon

Cushing Brothers' Company, Limited, Regina and Saskatoon, Sask., report as follows regarding the planing mill and other buildings which they are erecting. The factory building is to be 110 x 80 feet, with a wing 60 x 50 feet, two storeys, and built of solid brick on cement foundations. The engine and boiler house is to be built of concrete and brick and to be thoroughly fireproof. It is to be 36 x 42 feet, and two storeys high. The other buildings will include a two-storey warehouse about 60 x 110 feet, a lumber and moulding shed about 60 x 100 feet, a stable about 30 x 40 feet, and a few other minor sheds, etc. About three carloads of woodworking machinery will be installed at first and more added later. These will consist of everything required for a sash and door factory and moulding mill and only machines of the very latest type are being put in. Practically all the machines wherever possible will be driven by individual motor on direct drive, though in a few cases the motor will have to be connected by belt. The electric power will be generated by the company's own steam plant, consisting of two Jenckes boilers, 66 x 16, and an engine of 150 h.p. The generator and motors are being supplied by the Westinghouse Company, and the machinery, most of which is Cowan's, is being supplied by J. L. Neilson, of Winnipeg.

When the plant has been completed and the machinery installed, the company expect to have one of the most up-to-date mills of its kind in the west. Work is just being started on the buildings now and they will be pushed through to completion as quickly as possible. It is expected that the plant will be in running shape by the end of June. The estimated cost of the plant and machinery is $60,000.

Dauphin District Cut Nearly 100,000,000 Feet

Dauphin, Man., April 17.—The timber cut of the Dauphin district for the season just closed was the largest in its history. The weather conditions generally speaking were favorable, and lumbermen were quick to take advantage of them to increase their output. Besides the timber cut a large number of railway ties were taken out by several firms this winter.

The cut by mills is as follows:

	Feet.
Saskatchewan Lumber Company, Crooked River	7,000,000
Cowan Construction Company, Mistatem	8,000,000
Great West Lumber Company, Greenbush	10,000,000
Reed Deer Lumber Company, Barrows	16,000,000
T. A. Burrows, Grandview (old and new cut)	14,000,000
Dart Lumber Company, Birch River	3,000,000
Shaw Bros., Prairie River (old cut)	5,000,000
Standard Lumber Company, Winnipegosis	3,000,000
Hanbury Lumber Company, Roblin	6,000,000
Ruby Lake Lumber Company, Ruby Lake	4,000,000
Durban Lumber Company, Durban	500,000
Richard Keay, Kamsack	500,000
Caverley & Sons, Bowsman	300,000
Embleton & Blackburn, Bannock	500,000
Portable mills	7,000,000
Mutchenbacker Brothers, Mafeking	6,000,000
John Sinnott, Shortdale	300,000
Total	91,000,000

Good Year for Canadian Western Lumber Company

The first annual report of the Canadian Western Lumber Company, Limited, which took over the Fraser River Lumber Company's mills, at Fraser Mills, B.C., has just been issued. It covers a period of nine months, ended December 31, 1910. The past month of March recorded sales of 12,000,000 feet, which is the largest in the history of the company. An important feature in the company's year is the purchase of the Columbia River Lumber Company, for $5,500,000. This purchase is being concluded now. During the nine months ending December 31st, which the report covers, the earnings were $360,000, out of which there was paid interest of $225,000 $87,000 for sinking fund, $30,000 reserve for depreciation, $5,000 reserve on accounts receivable, and a balance of $11,000 was carried forward to profit and loss account.

Six hundred carloads of lumber and timber, amounting to 12,500,000 feet, was the record shipment from the mills of the company during the month of March. This is said to be the largest shipment made by any one lumber mill in the world, and during April it is expected that even this record will be broken. The shipments for the corresponding month of the year 1910 amounted to 9,000,000. Part of this shipment consisted of one cargo of 3,000,000 feet.

Of the March shipments, practically all of the lumber was shipped to the prairies. Two hundred carloads were sent to the west of Edmonton, to be used on the G.T.P. Railway construction. In one day last month the shipments amounted to 36 carloads. The mill is now running 12½ hours per day, instead of the usual 10 hours. It is expected that the additions which have been planned will be commenced within a very short time, so as to be ready early in the fall. It is planned to erect another planing mill, box factory, sash and door factory, and a woodworking factory.

Railway Belt Lands to be Re-classified

Acting in accordance with the almost unanimous wishes of western land owners, leaseholders, and lumbermen, the Department of the Interior at Ottawa has decided to withdraw the order previously issued that all timber must be removed from certain areas classified as agricultural lands, within a stated perior, under penalty of cancellation of the leases. Lumbermen and those holding timber leases in the Dominion railway belt in British Columbia have received this announcement with pleasure, as it means much to them. Mr. John Hendry and Mr. J. P. McCormick, representing many western leaseholders, visited Ottawa a couple of months ago and took the question up with Hon. Frank Oliver, and the change is largely the result of their action. The new order will affect hundreds of thousands of acres in the western part of the Dominion. The secretary of the department has sent a circular letter to leaseholders intimating that all timber lands in the railway belt now under lease will be re-classified.

Liverpool Statistics of Imported Joinery

Liverpool, April 21.—The importation of framed doors and of numerous small articles of manufactured woodwork which find a field for use in the family dwelling house, has become an old and well-established branch of the import timber trade of the United Kingdom. It is a special branch of the trade, as those who import cargo-consignments of timber, whether in log, plank, scantling, batten or board, rarely import manufactured doors, broom handles or blind rollers. These goods are handled by firms who make special lines of them and are known through the trade as importers of such goods. From the construction point of view, doors are the most important articles of manufactured woodwork which reach the United Kingdom. The importation of doors attained some magnitude from ten to fifteen years ago, but within the last eight years it has fallen off greatly. The fact of the importation has been used by tariff reformers as a standing argument against free trade, and has been one of the more frequently heard arguments. England, it has been freely urged, allows Canada and the United States to "dump" woodwork in English ports while joiners and carpenters in England have to walk about, out of work, and unable to find work. It has been freely said, that the importation of doors made in Canada and the United States, to England, has been one of the more potent and immediate causes of such unemployment as there has been in the joinery trade.

Some striking facts bearing on this import joinery trade have just come to light, and are causing a good deal of perturbation among tariff reformers and woodworkers who have given attention to the subject. A short time ago, a question was put in the House of Commons as to the value of the manufactured woodwork for house fittings, and the percentage of unemployment among woodworkers in the United Kingdom. As an answer to the question, Mr. Sydney Bruxton, President of the Board of Trade, has made a return of the value of the woodwork for house fittings imported into the United Kingdom in each of the last eleven years, and of the percentage of unemployment among carpenters and joiners in each of the years taken. The return is very suggestive, and is as follows:

Year.	Value of imported joinery.	Unemployed Carpenters & Joiners.
1900	£1,195,314	2.2 per cent.
1901	1,153,759	3.3 per cent.
1902	1,145,154	3.8 per cent.
1903	469,227	4.5 per cent.
1904	332,627	7.3 per cent.
1905	317,288	8.0 per cent.
1906	272,949	6.9 per cent.
1907	224,596	7.2 per cent.
1908	209,632	11.3 per cent.
1909	185,487	11.5 per cent.
1910	205,428	8.2 per cent.

The striking feature of the return is the great falling off in the importation of joinery which has taken place since the year 1900. The value of the joinery goods imported to the United Kingdom last year, was little more than one-sixth of that of the year 1900, while in 1909 the value was less than one-sixth of that of 1900-1901 and 1902. The percentages of unemployment among carpenters and joiners are puzzling. The percentage was smallest when the importation was greatest, and with remarkable consistency, it has increased as the importation of the manufactured woodwork has decreased. The very small percentage of unemployment in the years 1900-1 and 2, when a relatively heavy importation of woodwork took place, is particularly striking. The trade of the United Kingdom, moreover, as shown by the value of the exports and imports, each year since 1900, steadily increased until the year 1907. The next year, 1908, was a bad year, but the last two years have been much better. The figures afford no clue to the shrinkage in the importation of manufactured joinery or to the increase in the percentage of unemployment among carpenters and joiners since the year 1900.

Obviously, the goods were not received in England in the later years taken, as they were not shipped from Canada or the United States. As to why they were not shipped, this opens up a series of questions. It is extremely probable that the large importation of the years 1900-1902 caused a glut in the market and checked the importation. Also, that with the glut, the prices at which the goods had to be sold were so low, that exporters in Canada and in the States did not think the business worth further attention, for the time being. Then there has been a steady improvement in morticing and jointing machinery, and in framing-up appliances in England, and an adoption of machinery by master-joiners who have had little or none in the past, so that the means of production have improved. Then again, the house building trade has been very quiet, within the last five years, so that the demand for doors has been small. This quiet state of the trade explains the high percentages of unemployment in those years. It has been the state of trade at home which has governed the percentages, not the number of the doors imported from Canada and the States. The fact of present interest is, that the return shows that an importation of joinery goods to the value of about £200,000 still goes on in the United Kingdom. The value is small, compared with that of the years 1900-1902, but such it is. A spurt in the building trade would probably change the scale of consumption, and that of importation greatly. For such a "spurt" timber merchants in England and Scotland have been waiting with keen anticipation for a long time. They are now becoming impatient. The trade of the country has much improved since 1908, and they think it is high time the building trade began to feel the improvement.

Summing up the English Trade

Liverpool, April 19.—Dr. James W. Robertson, chairman of the Canadian Royal Commission on Industrial Training and Technical Education, arrived at Liverpool by the Mauretania from New York, on April 11. The other commissioners had landed at Liverpool on the previous Saturday. Speaking at Liverpool on the scope of the two Canadian commissions, the Commission of Conservation and the Royal Commission, whose members were then at Liverpool, Dr. Robertson touched on the Canadian timber trade, and summed up the position and prospects of the trade rather impressively. The Commission of Conservation, he said, was investigating and considering the condition and extent of Canada's resources. Their knowledge was very inaccurate even in regard to small areas, very incomplete in regard to big areas, and altogether badly arranged in their heads. Who knew the extent of their forest areas? Or the destruction and damage by fire or the loss from wasteful methods of lumbering? Or the possibilities of growing trees successfully on areas good for nothing else? In short, while the lumbermen and holders of timber were growing rich, was the wealth from forest protection and forest growth inuring to the benefit of Canada?

It was evident that Dr. Robertson and his co-commissioners believed that much knowledge on these subjects and cognate subjects had yet to be obtained. The work of the two commissions was, indeed, to try to obtain that information, in addition to much information of an industrial and technical kind.

It is reported that, although the Canadian tomato crop of 1910 was as large as 1909, the demand for canned goods has so increased prices have gone up and it is expected that the high prices will be maintained. That condition will mean an increased pack this year, and the Canadian box factories will reap some of the harvest.

Hon. George P. Graham, Minister of Railways, has given notice of a bill to amend the Railway Act, by extending the jurisdiction of the Railway Commission in the matter of making regulations compelling railway companies to adopt more stringent safeguards against fires, particularly in forest lands along their lines. The bill seeks to give effect to the recommendations of the Conservation Commission to this end.

In this age of specialists we frequently hear it remarked that the old all-round man is a thing of the past, and that Handy Andy is no longer appreciated. Yet upon inquiry among prominent institutions it is quite common to find some good all-round mechanic who is thought more of and turned to more frequently than any man in the place, and is considered almost indispensable. So, if the all-round man passes away entirely, it will be because the old ones have died out and the young ones have not qualified, rather than because there is no call for sucn a man.

THE WOODWORKER

Hook in Band Saws

The term hook, like a good many others used in connection with saw-filing, would mislead a body if he were ignorant of the matter and looked to the dictionary for enlightenment. It is proposed here to take it up according to the filer's meaning, together with some other points closely associated.

The degree of hook, say in a 12-inch band saw, would be the number of inches, or distance from a line drawn from the point of a tooth across the blade at right angles with saw, and another line drawn from same point parallel with face of tooth, and to be measured on back of saw. It is conceded that every band saw must have a certain degree of hook, so that brings us, then, to the "amount" that opinions vary on.

There are questions that arise here that cannot be proven by figures or worked out on paper, as a good many things can, but with close observation and thorough understanding of the matter they can be worked out in the filing room to an almost perfect answer.

One of the principal functions of hook is to regulate the saw in the cut, so that it will hold its place on the wheels, just as it does out of cut. Too much hook will pull a saw forward in the cut, while too little will let the saw run back.

A straight point entering wood will naturally be inclined to go straight in on a line from the angle formed by the point, as in A, fig. 1, but it has to overcome obstacles in its path that will likely change its course from that line, as in B, fig. 1. The wood being elastic more or less, causes a pressure and friction on the sides that would have a tendency to resist or push the point out; this varies to a certain extent in different woods, as is easily seen by any one using an axe. The harder the material, as a rule, the less pressure on the sides, and the softer, the more. For example, the cold chisel for iron is very blunt, compared to the long, keen wood chisel, though both have sharp cutting edges.

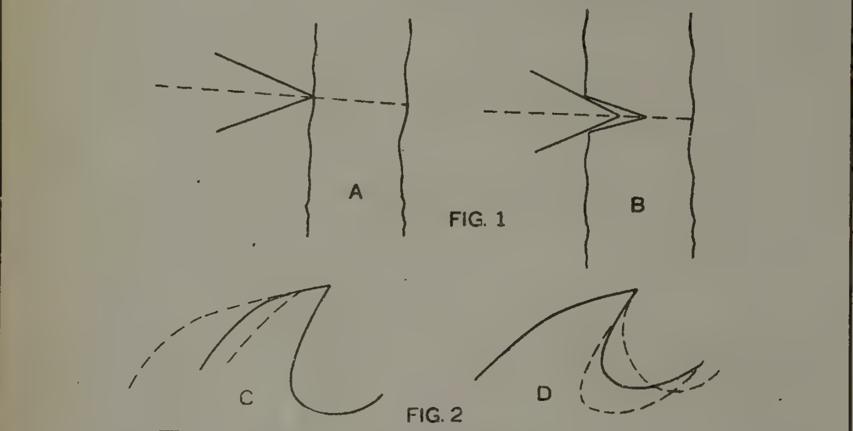

FIG. 1

FIG. 2

The Principle of Hook in Band Log Saw Teeth

As it is necessary to change the course of your lines a certain distance from the point of tooth; then how far should you go before the line should be curved? Take the line on back of tooth—if it is carried too far you take up too much gullet and reduce its capacity; also, if it is too short, the tooth is weakened, as at C, fig. 2. The throat or face line, if too long, will weaken the tooth, and if too short will cause friction by the sawdust and make gullets run warm, and also not let the dust circulate in gullets to best advantage, thereby not getting the full capacity of gullets—see D. fig. 2.

Headache is often attributed to the wrong cause. So are a good many of the pranks of the band saw, and in this connection it might be well to consider some of those more generally credited to the hook in the saw.

I have seen a mill cutting shortleaf yellow pine that could not carry more than 6-inch hook without making the saw run ahead too much in the cut. This was caused by lost motion in the bottom boxes, that allowed the bottom wheel to lift when the extra strain was put on the saw in cutting, thereby inclining the saw to run farther ahead, just as too much hook would do.

A sawyer called me out to find the trouble with a saw on one occasion. He had stopped sawing. The saw was travelling about right on the wheels, but as he started sawing again the saw started to come ahead, and by the time he would saw several lines close together, the saw would be ahead several inches. I noted a lot of sawdust flying about, which gave the clew, and, upon investigation, after stopping, found a splinter lodged underneath bottom guide, that turned a big part of the sawdust between the saw and wheel.

I had a resaw that would run back on the wheels when the mill began stopping, and come ahead again when the mill would get up speed. This also was caused by play in bottom boxes. The strain on the saw just about balanced bottom wheel, and when the power was shut off the momentum of the saw was greater than the other machinery, so it did not need the strain of the belt to pull it, and thus let the lost motion of the pulley end of the shaft go to the top.

When a saw shifts its bearing on the wheels from one place to another without any apparent reason, it is not in the saw. If it is caused by something heating the saw, that can be easily told by feeling the blade. If from gum or any foreign matter collecting on saw or wheels, that can be seen. If neither of these, then look to the wheels for the trouble. You will likely find lost motion somewhere.

If for any reason either of the wheels moves out of its accustomed place, though ever so little, it is evident the saw will change its bearing.—A. D. Plowden, in the Woodworker.

Shop Talk—by E. M. Mershon

"The possible and actual practical results attainable by the use of band resaws, and the progress which has been made in that line," was the subject on an address delivered recently by E. M. Mershon before the National Association of Box Manufacturers. Mr. Mershon's remarks were in part as follows:

So far as the fitting of the saws is concerned, there have been no recent radical changes. There have been numerous improvements added to the machines themselves, which have added to their convenience and contributed much toward higher efficiency and better quality of work. Still the fact remains that the two important ends to be secured by the use of the band resaw are: First and foremost, economy, or saving in saw kerf, which carries with it quality of the resawn product—a thin saw kerf may follow the saw in an irregular path, resulting in anything but economy. Second, and of lesser importance, Capacity.

Economy depends upon minimum saw kerf, accuracy of sawing, and freedom from expense of fitting repairs, etc.

To saw accurately, the saw must be made as stiff and rigid as possible in the vicinity of the toothed edge of the saw. In other words, the points of the teeth must be so supported as to resist with the greatest force any side thrusts which may be exerted against the saw blade, especially toward its forward or cutting edge. The back of the saw blade must follow in the path cut by the teeth, for it is the teeth that do the guiding.

We have found that the tensile strength of a band saw blade is about 200,000 pounds per square inch cross section, and that a narrow saw blade strained up somewhere in proportion to its tensile strength may be made to do more work and remove smaller saw kerf than a wider and heavier blade subjected to less strain in proportion to its width and thickness. To illustrate, we sold a seven-foot band log mill to a Canadian party some time ago. He started out with saws 10 inches wide and carried 7,000 pounds strain on them. He ran these saws down to 7 inches in width and still continued to carry 7,000 pounds strain without breaking saws or without any appreciable lessening of the capacity of the resaw. So that from our experience we can advise carrying ample strain on the saw blade.

Support the tooth edge of the saw more by straining it up taut on the wheels and less by rolling or hammering the central portions. The latter method puts all of the strain on the toothed edge and none on the centre, whereas the former, leaving the same amount of strain on both edges of the saw, stiffens up the central part, making the saw less liable to snake and reducing its tendency to crystallize by hammering the saw guides or by striking hard knots.

Having stiffened the saw blade on the wheel, all it is possible to do, by following out the method suggested above, it then becomes necessary to remove all the side friction possible from the points of the teeth. Theoretically, the only part of the band saw blade which should come in contact with the wood which the saw is cutting, is the straight line which is represented by the cutting edge of the saw. This straight line extends entirely across the cut, if the saw be fully swaged, and should be, I repeat, theoretically, the only part of the saw to touch the wood.

To accomplish the best results, side files should be avoided, and if a pressure side dresser is used, this should be examined critically, with ones' spectacles on. In many instances I have found that the pressure side dresser having been neglected, became an ideal tool for dulling the saws. In fact, the pressure side dresser can be made to as effectually dull the points of the teeth as a day's run.

Saw filers sometimes get in a rut or become careless and in place of improving in their work, drop back. To illustrate this: We, at one time, had a large quantity of 5-4 x 10-inch to resaw into ¼ x 10-inch. There was ¼ to throw away in sawdust and planing. After running a month or six weeks on this class of work, it became necessary to resaw some wide 2-inch uppers and dress the resawn boards two sides ⅞-inch thick. I was coolly informed that this had never been done and could not be done. This resulted in our insisting upon every saw blade being fitted to remove exactly 1-16-inch saw kerf.

We made what we call kerf gauges, or small pieces of steel polished and ground exactly 1-16-inch thick, with a hole drilled near one end. These were hung up on a post near the resaw and orders given that whenever a saw was put on the machine which removed a kerf in which this kerf gauge did not fit tight, the saw was immediately to be taken back in the filing room and the set removed until the kerf gauge fitted.

We demonstrated that it was possible to resaw accurately all classes of material, removing a saw kerf of exactly 1-16-inch; in short, to keep the saw kerf almost to within 1-1000-inch of this size.

About this same time, the saws became inclined to snake, and I suspected that the trouble lay in the pressure side dresser, which I found to be the case by simply drawing the thumb and finger from the base of the tooth past the swaged points. If the corners are of the correct shape they will feel like fine needle points, whereas, if they are of incorrect shape, they will feel like little beads.

Tests of this kind become second nature to one who gives the subject of practical wood working and box making his attention, and these are the little details which render it possible to effect economies which oftentimes change a debit balance to a nice credit on the ledger.

As an illustration of what painstaking will do, in connection with modern band resaws, I would state that we have recently succeeded in resawing ⅞-inch planks 52 inches square by ⅞-inch thick and secured two perfect piano sounding boards therefrom. To say the least, a cut 52 inches deep, 1-16-inch saw kerf, and perfect sawing, is remarkable.

The Present Practice of Machine Woodworking

It is a common practice to set patterns of mouldings on a sample board with the flat side of the mould next to the boards, says H. H. Hatfield, in Wood-Craft. It is frequently the case that a pattern has to be measured "work ways," and it is a good idea to set them on the board in that manner. It also shows the moulding to better advantage.

In running a twist belt there are few operators who note toward which side of the pulley they run the slack of the belt. While it may make no difference in a light cut, as on the bottom head of a moulder, it is safter to have the twist to run towards the flanges so that in case the head gets stuck from a chip or other cause the belt will stay on the pulley and run against the flanges and not have the slack side track off the edge of the pulley to the outside and fly back and mix up with the countershaft.

A friend writes me that I am a little severe on the individual who does not know as much of the details of woodworking machinery as I am supposed to know, and suggests that it is perhaps because that man has not had the chances that I have had. Well, what would you feel like saying to a man who had been running a moulder for something like twelve years, when he set up for a crown mould and put a balance knife on the top cylinder about 4 inches to one side of the line of travel of the knife it was to balance? Would you think of your Sunday-school lesson, hunt up a hymn book to ease off your feelings, or would you just go at him roughshod and try to impress it on his mind that it was high time he was learning the difference between right and wrong, especially as he was getting paid to know the difference! Ignorance is excusable when there is no opportunity to learn, but no man in this business has any excuse for staying ignorant when he can get the knowledge so cheap.

Belts and Boxes.

Good mechanics may protest against a belt drawing against the cap of a box. They object to belting a planer from above because the pull will be against the caps on the bearings. Now, it may not have occurred so some that the pull of the belt on the box is of little or no consequence compared to the pull of the knives in the wood. The only time there is any pull whatever from the belt, is when the machine is running empty and this is only a small fraction of the time, as the operator should keep it running. When there is stock in the planer, I venture to say there is little or no wear on the cap, as the knives, striking the wood in a hooking manner, drag down a great deal more than the pull of the belt. We notice that manufacturers of four-side moulders tip the yokes on the top and bottom heads in such manner as to make the pull of the belts come on the bottom of the box. This may be well enough but in my estimation it is theory pure and simple. In theory it would seem the only proper method, but practice sometimes explodes theories and exposes things in a light entirely different from that in which the mechanical architect places them on paper.

Running Mouldings Face Up or Down.

This matter of running mouldings face up or face down depends, first, on the machine, and, second, on the mouldings. A great many moulder operators fail to use the brains given them and they run stock a certain way because somebody else runs it that way. In some machines the bottom head is very hard to get at and shouldn't be used for facing a mould except when the nature of the work makes it actually necessary. Don't be faddish about these matters; study them; work moulding and everything else the best and easiest way.

While it does not seem possible, it is a fact that there are some woodworking shops in which there is not a single man who can do as much as file an ordinary rip saw and do it correctly. I had occasion to visit a shop recently in which there had been a good deal of trouble with the small saws. At the owner's request I went over the saws with the young man who was trying to do the work, and found him to be pretty well posted—on flour mill machinery! Here he was to do the machine work in a factory of a totally different kind; had never had a day's experience, nothing more than a little instruction from a friend in a neighboring mill, and these instructions were doing more harm than good. His rip saws were filed with a good bevel on the fronts of the teeth; the crosscuts were filed square in front of the teeth. As the saws were cutting dry oak, it was a hard job for the men at the machines, as all the work had to be pushed past the saws by hand. It did not take long to fix up one of the saws and let them see the difference in the cutting and the ease with which the work was done. Thus another man had his ideas changed by what he saw and did; not by what someone else told him to do. I know there are many men filing saws, who have been a long time at the present jobs, who still do the same old things with the teeth they did a long time ago, but that doesn't make it right just the same, and if they are succeeding in a manner in satisfying their employers it is because the employers aforesaid do not know any better, or because of other circumstances that contribute to their help in filing—not because they are correct in their methods, by any means.

Sometimes there is at the bottom of a pile of stock a tier or two of lumber that has moulded but which would not have happened if there had been any chance for a free circulation of air under the pile. In putting in the last lot of stock sheds I took pains to see that the stock had a free air space of 3 inches. Should it chance that a blowing rain gets water under the stock, it can find no lodging place and will drain away, giving the stock a chance to dry out.

It doesn't always get it, but a dry kiln should have as much expert attention every day as the most complicated machine in the factory.

The man that would rather read a beer sign than a trade paper is looking the right way to get nothing but beer wages all his life.

In making beaded ceiling I find it better to cut the bead nearly 1/16-inch below the surface, so that in such stock as does not dress or is often sanded or finished by hand by purchasers to improve its appearance, the top of the bead may not be taken off. I once had an order for some maple beaded ceiling that had to be polished. When running it I had the machine man cut the beads below the surface and then put the stock through a Whitney scraper. The surface was as smooth as glass, a mirror finish.

Pulleys and Balancing.

One of my men wanted to know how the pulley men could tell the weight of the balance legs so often seen in pulleys. He thought it must take a lot of guessing to get it just right. That is an easy one, when you know how. If that sort of trouble arises, get a wad of clay and add it to the light side of the pulley when on the balancing ways, putting on just enough to make a rolling balance. Then take it off and get the exact weight of the lump of clay and you have the exact weight of iron needed to make the pulley balance. There are probably other ways as good but I saw this way used in one of the best shops in the country, where they do things very nearly right, and it looked good to me. It is easy at any rate.

About the first thing to happen to a new machine is to get the feed-rolls marked up, scratched or otherwise marred from the scrapers put on them. I think I would have the scrapers left off my machine rathed than have the very rolls that should be smooth all marked up. Probably one scraper in a hundred is of any service. If the wood is gummy or pitchy, as yellow pine is, the scraper won't take off the gum without kerosene, and if it is hardwood there is no scraper needed. It is a source of a good deal of bother and goes to swell the price of the machine for nothing at all. It is like the front feed level on one class of matchers, of no more good than a woman's umbrella, unless used for the same purpose at time—to flag a street car.

It not infrequently happens that a cross-grained board breaks in the matcher and it is one of the most tiresome of jobs to turn the feed pulley around by hand to back out the board that is stuck. To do this easily and quickly, we twist the feed belt, start up the machine and run the feed works reversed, drawing out the board in short order. There is a peculiar thing about the feed belt doing this. When it is twisted it often runs up on the flange of the feed pulley, and this 3½-inch belt will run on the face of the flange, only ¼-inch wide, and stay there. If we wanted to do such a thing it is likely we would have a time trying to do it. It is in the way the belt is twisted—by making a tight side of a pulley one that gives the belt a lead to one place. This reminds me of the fact that one of the men who tried to run this machine had the loose side of the feed belt leading direct to the feed pulley, and had the tightener running on the tight or pulley side of the belt. Of course, it drove the feed works, but it was not the way it was intended to run, and it looked too odd to be left in that position.

Protect Your Floor Openings

A large number of woodworkers are built according to what is known in insurance parlance as "ordinary construction." Such a building may be of brick, stone or frame construction, having open joist floors, combustible partitions or none at all, unprotected floor openings or other deficiencies not permitted in "mill constructed" or "fire resisting" buildings.

Very often considerable money is expended for fire protecting apparatus with the expectation of protecting such a building as far as possible from the fire hazard. This is very well indeed, but has it ever occurred to you that faulty construction may counteract the effectiveness of the protection? Buildings are often so arranged that an incipient fire may be encouraged to such an extent that water even as a fire retardant is wholly ineffective. Unprotected floor openings such as open elevator passageways, stairways, chutes and excessively large belt holes, have most frequently encouraged such fires.

The building trade in Canada has done well during the first quarter of 1911. Statistics from the leading centres are as follows:

City	Mar. 1910	Mar. 1911	3 mos. '10	3 mos. '11	Increase %	Decrease %
					for 3 months.	
Vancouver	$1,806,106	$2,147,798	$3,318,212	$4,607,330	39	
Toronto	1,583,165	2,210,770	3,125,693	3,638,940	16	
Montreal	674,804	1,101,577	1,110,344	2,109,845	90	
Calgary	415,800	1,012,260	692,100	1,641,960	137	
Winnipeg	2,543,150	1,007,400	3,067,050	1,639,600		47
Regina	329,650	545,025	382,490	622,225	63	
Victoria	244,760	279,945	525,505	614,340	17	
Edmonton	264,435	396,825	337,555	519,055	54	
Hamilton	289,390	350,300	346,040	465,000	34	
Ottawa	219,350	134,475	374,200	228,075		39
Fort William	92,585	166,850	162,200	202,175	25	
Lethbridge	124,000	81,500	212,605	140,000		34
North Vancouver	....	47,700	....	116,715		
Windsor	27,225	60,250	37,975	113,625	199	
Moose Jaw	58,825	74,100	69,875	87,100	25	
London	139,700	65,638	221,832	85,863		61
Quebec	25,100	48,000	43,300	85,000	96	
Brantford	11,470	43,445	26,670	60,645	127	
Halifax, N.S.	43,800	22,000	88,975	36,600		59
St. John, N.B.	48,250	13,400	94,750	30,200		68
Port Arthur	5,365	14,810	5,365	20,360	279	
Sydney	17,935	12,440	20,910	20,220		3
Kingston	14,850	19,172	20,875	20,102		4
Peterborough	10,327	6,655	17,477	13,210		24
St. Thomas	15,500	9,850	20,200	12,300		39
Stratford	6,310	8,610	18,580	9,170		51
Totals	$9,011,852	$9,880,795	$14,340,778	$17,139,655		

Total Increase of first quarter of 1911 over corresponding period of 1910, **20 per cent.**

This would seem unaccountable when the slight remedial cost is considered. An elevator or stairway opening may often be protected by a trap covering, fitting directly over the opening. The better way is to enclose these openings with a slow burning wood or with brick, and to provide the necessary openings with self closing doors. Belt holes should be minimized in number and in size as far as possible.

The meagre expense so involved may more than double the capacity of your present fire protecting apparatus. The following words from a prominent insurance surveyor might well receive consideration. "Probably the most pernicious cause of the rapid spread of fire in this class of buildings is unprotected floor openings. Indeed, the lack of horizontal floor cut-offs in any type of building is often sufficient to offset the advantage obtained by protective apparatus."

Veneer and Compound Doors

That compound or flush veneered doors have come to stay is beyond question. This new style of construction presents so many points of distinct advantage over the old-fashioned panel door as to give it a favorite place for inside and outside use, says Hardwood Record. There are so many reasons why a flush door of built-up stock is better adapted for all uses than the other type that it is hard to pick out any one reason which carries more weight than the others.

Probably one of the most striking features of the flush door is the unusual beauty of design and figure which can be secured. As there are no broken surfaces, matching becomes comparatively easy and the natural beauty of the grain of the wood can be preserved. In addition, designs of all sorts and styles can be worked out merely by inlaying with wood of a different color. One favorite combination is finely figured quartered oak for the body of the floor, and mahogany worked out in such designs as trees and ferns. There is no limit to the ideas which can be applied in this way, and it certainly makes a novel method of decoration.

Aside from its beauty when freshly installed, the flush veneered door takes on additional beauty with age, rather than deteriorating. This is probably because in this style of construction the flat surface exposed is not subject to warping and twisting and cracks which so often occur in panel construction.

Of the mechanical advantages due to this new style probably most important is its soundproof character. It is a well known fact that two or more layers of any material placed together have more power of resistance for sound, heat or any other influence than one solid piece of the same substance. In addition the door makes practically a fireproof partition and is far more burglar-proof than the common panel door.

One of the principal advantages of this method of construction is that the possibility of warping or shrinking is practically eliminated. The peculiar method of construction holds every part in absolute rigidity. The fact that there are no open joints exposed to the weather makes the door particularly serviceable for exterior use.

The doors usually are built-up of five-ply veneer. The core is made up of a number of strips dove-tailed together and glued up, insuring a body in which there is no possibility of shrinkage. For the core the common woods are used, such as ash, while for the cross-banding and surface veneer more expensive wood, both domestic and foreign, are best suited. White pine or cypress are not well adapted to this purpose, as in cutting veneer from cypress it is very apt to shatter, while the grain of white pine is too soft to make a good veneer. Birch, mahogany, oak, elm, walnut, poplar, basswood, maple, gum and ash are some of the hardwoods commonly used, and all are about equally well adapted as far as physical qualities are concerned. Some, of course, are more expensive and possess a richer color and better figure than others.

The usual sizes for doors are 1⅜ inches thick for doors 2 feet 8 inches or less wide; for doors 2 feet 8 inches and over they should be 1¾ inches thick. The saving on an ordinary door by using 1⅜-inch instead of 1¾-inch is about twenty cents.

In building up the ordinary flush veneered door the entire process is done as far as possible simultaneously, thus insuring the greatest stability. After gluing up the entire mass is dried out at one operation, if possible.

CAMP DEPARTMENT

Some Things a Forest Ranger Should Know

By C. H. Shattuck.

A brief summary of the information which a young man about to enter the forest service as a ranger should have may be of interest. In my judgment the first essential is a knowledge of the general geography of the district which he is to supervise. It is very necessary that he be able to direct those under him as to the location of meadows for the pasture of horses, the name and course of various streams, the trend of mountain chains, and the names and locations of prominent peaks. He should have a very thorough knowledge of roads, trails, and the location of cabins, and the manner of constructing each. He must also know how to handle horses. The ordinary mountain cayuse instinctively knows the tenderfoot, and will proceed on the slightest provocation to reveal bits of equine ingenuity which are sometimes surprising and often aggravating in the extreme.

It is imperative that he be familiar with the business of packing; this can only be acquired by actual practice, either in his college course or in the field. Many a young man has come to grief in the practical rangers' examination because he could not put up in a permanent manner a conglomeration of cooking utensils, axes, shovels, crosscut saws, provisions, and sleeping and wearing apparel. He must know how to throw the diamond-hitch and the various swings and loops for holding each of the above necessaries on the back of a sliding, climbing, jumping horse. Roads and trails are often steep and sometimes barred by various sized logs, the jumping of which by the horse tests thoroughly the packer's skill in the use of rope.

The ranger must be able to select suitable provisions and must know how to do ordinary cooking. He must have things which cannot be brought from the far-away bakery. Bread must be made, meats prepared and cooked, and various vegetables and cereals come in for their share of attention. Making camp is another important feature. In selecting a site the essentials are: Good grass for his horses, good water for camp purposes, if possible good fishing, and, in dry seasons, such a location that the fires may not burn his entire outfit. In addition he should make it his business to be familiar with the forest laws, and the rules and regulations affecting his reserve. He should know as intimately as possible the people who reside within the boundaries of his district, as much of his success will depend upon the wise and tactful manner in which he conducts himself in all his relations with them. He should know, if he should be in a grazing region, the brand and ear-marks of the stock in his district, and the approximate number owned by each individual. He must know the timber of his district both as to stands and kinds of trees. If lumbering operations are conducted he should see to it that the cutting and burning is carried out according to contract. In much of this western country it devolves upon him to act as a protector of game. The actual settlers are generally glad to stay within the limits of killing fixed by the game laws, and they do not approve of the intrusions of the poacher, whose main object is to kill as much as possible without regard to law. As an officer of the law, the ranger is a great influence in ridding the reserve of ruthless hunters who kill often for horns and teeth only.

Such, in brief, is the essential information which a ranger should have. Over and above this, he should be a man who is able to impress those with whom he comes in contact with the idea that he stands for law, for justice to all and malice toward none. He must be fearless in the exercise of the duties devolving upon him, some of which require courage, and others great powers of physical endurance. It is desirable that he be not too far removed from the land of his birth, as the native will be much more apt to deal in a manner to be commended with the many perplexing problems constantly coming up than one brought from a distance.

Duplex Yarding

By Thomas W. Hine.

The following description of a duplex engine is calculated to point out the essentials of a machine actually designed to perform the work of two yarding engines. It will be noted that all details of construction have been made to conform to this purpose.

Of all the problems connected with the manufacture of lumber, the most intricate and hardest of solution are those dealing with the conversion of the tree into the log and the delivery of the raw material to the pond at the mill. The difference in cost of manufacture of the log into the finished product in a strictly up-to-date mill and in one tht should be in the scrap heap can usually be figured in cents per thousand. When a lumberman starts in to convert a tract of standing timber into logs, he has confronting him an entirely different proposition from the manufacture of the log into lumber. Each individual tract has its peculiar topography, and will probably present questions for solution different from any that he has had to solve before. If he fails to apply the correct solution to the individual problem, his loss per thousand will probably be measured by dollars rather than by cents.

After the general plan of operation has been decided upon, the details must be worked out and the machinery best suited to the particular operation selected. The logging engine best adapted for general use should fulfil the following requirements:

1. It must have plenty of power.
2. Its boiler capacity must be sufficiently large to mtain a maximum pressure under continuous use with poor fuel.
3. It should be simple in construction and strong enough to be practically unbreakable.
4. It must be fast and dependable.

In the Duplex logging engine all these requirements have been carefully considered from the standpoint of actual use, and I believe that all of them are more nearly met than in any other logging engine on the market.

The Duplex yarder is not a cheap machine, the item of first cost being left a secondary consideration as compared with its ability to give highly economical and productive results. It is provided with the usual type of high pressure double engines, 11 by 13, furnished with steam by a 72-inch boiler. The arrangement of drums and gears shows the ordinary tandem arrangement found in a road engine, but with double the ordinary number of drums. The gearing is of cut steel throughout, the main drum gear being 66-inch diameter, while the trip drum gear is 50-inch diameter. These gears are located in the middle of their shafts, making it necessary, on account of the great pulling capacity of the machine, to have shafts of unusual diameter. The main drum shaft is 9-inch diameter, while the trip drum shaft is 7-inch.

The main drums are of steel of the ordinary narrow drum type, with the exception that they are provided with heavy ratchets cast integrally with them and are hung on very liberal roller bearings. The cable capacity of each drum is approximately 2,000 feet of 1⅛-inch line, the trip drums being designed to carry their proportionate share, of 9/16-inch return line.

To insure convenience and rapidity in handling so many drums, all four are equipped with direct action steam frictions and all operating levers are banked in quadrants, so that the operator, standing in a convenient position, can perform the ordinary functions of running the engine. The whole machine is built up on heavy 18-inch steel beams. Its construction throughout makes strength and durability the primary considerations.

The Duplex yarder is nothing more nor less than what its name indicates, namely, two logging engines in one, and if there was no other advantage than the ability of having available at all times two complete sets of drums, cable and equipment, this alone would form sufficient apology for the introduction of this type of engine, as the advantage of being able immediately to overcome the delays consequent upon incidental difficulties such as broken cable, defective frictions, cut bushings and any other operating trouble is well worth the extra expense involved in the first investment.—American Lumberman.

The recent outbreak of smallpox at Ottawa was reported to have resulted from the influx to the city of men who had been working all winter in the shanties where smallpox was prevalent. One of the men who had worked in such a shanty was seen recently, and he stated that everything was done to prevent contagion from spreading in his camp. A "pest house" was built, all the men who had not had smallpox before were vaccinated, and when the sickness was over, the place was fumigated by a visiting doctor. In the shanties, as in Ottawa, the smallpox was of an exceedingly mild type. The shantyman said that the men worked for sometime after the pox had appeared on their faces, not knowing what it was. They were not sick at all, but were able to take care of themselves in the pest house, and rather enjoyed the rest. Light as it is, however, there is an agitation that more precautions be taken to prevent the city suffering from it each spring. Dr. Bell, of the Provincial Health Department, pointed out in an interview, that great precautions were already taken by the department.

The village of Kippewa suffered heavily from fire recently. This is a well known distributing point for lumbermen on the Quebec side and is chiefly kept up by this traffic and the tourists and hunters who leave civilization at this point. The buildings burned were the C.P.R. station, the large store of Messrs. Shanon and Fraser, and a large store and hotel owned by Mr. John Lumsden.

The Retail Dealer and His Problems

As Others See Us—Office System in Yard

As "Kit" Saw the Canadians

C. H. Ketridge, in writing in the Mississippi Valley Lumberman of his visit to the retailers' convention at Winnipeg, makes some interesting comments. The following paragraphs are included in Mr. Ketridge's article:

"The first big impression I received was when I began to be introduced to members who had travelled over 700 miles to come to this meeting. Out of the more than 200 who were present I didn't meet over a dozen who had come much less than 100 miles. Of course there were some there from points nearer by, but I believe fully half came from points 150 to 800 miles distant, and the strangest thing to me was they didn't seem to consider it anything out of the ordinary.

"Canada is becoming another synonym for opportunity to the man with iron in his blood and wants to be distinctive in the world of achievement. Fast as this country is growing, keeping pace with it, is the ever increasing number of this class of men who are coming in to take and develop the opportunities. The yards are as comparatively numerous here as they are in the new southern states. A new town up here never starts with fewer than four or five yards. It would look like a lack of enterprise to start with less than four, but then think of the territory on either side of them. About 40 per cent. of the yards are handling coal, but I found none who did not seem to like the business, and, therefore, preferred to "mark time" during the severest of the winter weather, which on the average is only about two months. The days, though, when they can work, are long enough to even things up. In the summer time they have but three or four hours of darkness in the twenty-four hours, and as there is no time limit on work in a lumber yard up here the chances are they put in as many hours during the years as the boys do further down "over the line." They say you can read a paper at 10 o'clock at night without the aid of artificial light, and it is daylight again at 2.30 a.m., so you see things are evened up as well here as anywhere else in this universe of compensation.

"Frankly speaking, I did not expect there would be over a hundred dealers in attendance at the meeting, including also the travelling salesmen, but as there were fully 200 at one of the sessions there must have been more all told than that."

Speaking of one phase of the meetings Mr. Ketridge writes:

"No committee on resolutions nor one on nominations was appointed, and if I remember correctly there was only an auditing committee appointed. This is, as I understand, the following out of a long established custom. I have no criticism to make of this plan, other than I always consider that the formal adoption of resolutions is the expressed sense of the collective judgment of the association on matters at issue, and shows how and where it stands on them. The reason no committee on nominations is appointed, is that this is the most democratic country on earth, barring none. The "Referendum" has its full course here, and is glorified and stuck to with a jealous guard of its privileges."

Knowing Retail Wants

No retail lumber dealer ever makes a mistake in paying too much attention to a customer. There have been yardmen before this who, when a customer asked for a particular quantity of a particular dimension, were satisfied to pull it out of the pile, load it up, take the money and return to the office without any more than commenting on the extent to which the weather would help the crops. It may be that the customer will go out of the yard and find eventually that the material he bought was unsuited to his purchase. He may not discover the fact, but the fact may exist nevertheless. Had the dealer made a little inquiry in a friendly kind of way he might have been able to save his customer money and to assure his friendship. The dealer may have had in his yard some special snap that would have returned him as much profit and caused the buyer less expense. Hundreds of contingencies revolve around a better understanding of the deal by both buyer and seller.

Few men will resent a little friendly interest in their activities. Most men who are making improvements or changes are quite willing to talk about them. Most men recognize that the lumberman knows more about lumber than they do and they are really eager for suggestions. The man who sells lumber like kerosene, by the quart, makes slow progress in establishing himself in the community. The dealer himself can extract some benefit by a little closer contact with his customer. The customer may learn something from the dealer and the dealer may often learn something from the customer. Often the layman hits upon a new use for certain stock that had never occurred to the lumberman himself; and, when another customer enters the yard looking for material to fit a similar purpose, the dealer knows the thing that will suit him best. Public men are learning the value of getting close to the people. Retail men should learn the value of getting close to their trade. It helps everybody, hurts nobody and makes the prosy details of business a little more human, a little more brotherly, and lifts it from the dulness of a simple transaction to the plane of mutual helpfulness.

The Man Who Doesn't Know

It is a daily experience with the retail yard salesman to have people come to him to buy lumber whose knowledge of the subject is such that it might truthfully be said that they have little idea of what they should ask for, or of what they really require, and quite as remote ideas as to what they should pay when they have finally been supplied.

Such buyers are of the problems of life to the salesman of the retail yard. It is an entirely differnt proposition to do business with such a one and to sell a regular customer who knows the ropes and who can tell his needs in a few expressive and pithy sentences.

But the man who has much to learn in regard to buying lumber is not so easily disposed of. The sum of his knowledge often consists of the mere information as to where and for what the lumber he intends to buy is to be used. Partly by suggestion, partly by assertion, the salesman does the rest. The effecting of the sale is no easy task. The buyer must put a score or two questions in regard to qualities, sizes, prices, quantity required. It has been said that a child is able to ask questions that will puzzle the wisest philosopher; this is not a jot more certain than that the unsophisticated buyer of lumber is able to ask questions in regard to that staple that will drive the glibbest salesman to the brink of desperation. He doesn't know the difference between B select and plain ship-lap and the queries which mark his efforts to learn why one is $60 per thousand and the other $30 provides a strenuous task for the salesman, and one that gives little reward for the labor. It may be that the bill is for the building of a country school or church, or barn, or for a verandah or a summer cottage; it often means more hard work than the selling of ten carloads to regular buyer.

Such a class of sale is hard to effect and oftentimes is less satisfactory than if the buyer were thoroughly well versed in the pro's and con's of a business which has many phases and conditions of price and material. To send a buyer who is not in the know on such an errand is much the same as sending the average man to buy a hat for his wife, except that a man in a millinery shop is well aware that he is on strange ground and that his knowledge is lacking, while this is not always true of the buyer of lumber who lacks experience.

The Small Bandsaw in the Retail Yard

In discussing lumber yard conveniences, particularly the ripsaw and its various advantages, one is reminded of similar mechanical apparatus which might be added to the lumber yard equipment with advantage, says the American Lumberman; for example, the small bandsaw, which is used for ripping stock and doing shaped work. With it the wants of carpenters may be supplied, not only in strips and odd dimensions but also in the way of segments and various other shaped work than can not be done with a ripsaw.

There is no question but that a small bandsaw is a valuable machine in a lumber yard, and although it may cost more at first than the ripsaw it does not require any more power or skill to operate, is just as easily set up and takes up but little more room. A small bandsaw having wheels between 30 and 40 inches in diameter can be used for cutting out segments, for oval or round top window and door frames, for arches of various kinds and for scrollwork; and at odd times, when business is not too brisk, scrap stock may be worked up for use in exterior and interior decoration. There is not much call for this class of work at present, as it can be bought ready made cheaper than it can be manufactured by the yard man, yet there may at any moment be a call for an individual pattern, in which event the bandsaw would be invaluable. With it also the yard man may block out shaped stock for carpenters and save them much tedious work, and at a low price.

In bandsaws, as in ripsaws, there is a wide range in size and variety. Some are designed especially for ripping and resawing, and others more particularly for shaped work. The machines for ripping and resawing are coming into general use among up-to-date planing mills and are to some extent taking the place of the older type of ripsaws. Some have special power feed appliances for ripping large quantities of stock and have also a special roll feed for resawing and making bevel siding. Machines of this type are more expensive in first cost and require a higher degree of skill to operate. They carry saws ranging from 2 to 4 inches in width, the general average probably being 3 inches, and they do a remarkable amount of straight line work. These are generally straight line saws, and are designed more to take the place of power feed ripsaws than the old circular bevel siding saw for lumber yard use. Instead of two machines, a feed ripsaw and a circular resaw being necessary, bevel siding can be made with one of these bandsaw rigs. They may be used also for heavy ripping, in quantities, and for anything that comes within the scope of the machines usually taking in widths up to 10, 12 and 14 inches.

The smaller bandsaws, that have light wheels with rubber bands and carry saws ranging in width from ¼ to 2 inches, are better for scroll and shaped work than for ripping, for which reason, some planing mills use them on scrollwork exclusively. With work enough at hand to justify it, a simple ripsaw and a small bandsaw, both may be found desirable and worth their keep.

The difference between the scrollsaw and the small bandsaw in doing scrollwork proper is that inside work can be done with the scrollsaw by boring a hole, whereas with a bandsaw the only way to get inside the piece is to cut into it, which spoils the appearance of the job. Furthermore, the scrollsaw does smoother work than the average bandsaw and takes less time to finish off for varnishing. This is because the scrollsaw carries a thicker blade, giving it a thick front and thin back, and it does not have the teeth sprung out or set. Consequently it does not leave saw marks or scars like the average band saw. On the other hand, a bandsaw will do the work much more rapidly than the scrollsaw, and for this reason the planing mills use the bandsaw at times almost to the exclusion of the scrollsaw, to save time and cost in doing the work, and if care is taken in setting the teeth of the bandsaw it will do very nice work.

The wider bandsaw blades are better for ripping, and the narrow blades only should be used for scroll or shaped work. Straight ripping can be done with any kind of a bandsaw blade; even ¼ or ½ inch wide will do straight line ripping; but the narrow saws are likely to dodge in ripping, so that in ripping framing or anything of that kind, if not very carefully filed the saws may spring to one side or dodge around knots and run "snaky" through the cut, making the job decidedly inferior when compared with the work of the common ripsaw. In fact, a good plain circular ripsaw will do a much nicer job of ripping than a bandsaw; yet by putting saw blades 1½ or 2 inches wide on an ordinary small bandsaw good ripping can be done and a saving in kerf effected that is worth while when the stock being ripped is scant and it is desired to guard against waste.

Once used, the bandsaw is seldom discarded. It is just the saw for cutting rafters and other work requiring notching, such as stringers for stairways, etc., work that is difficult to do with a circular saw because it does not cut square through the piece, whereas the bandsaw will cut perfectly square and leave a clean inner corner. Whether a bandsaw of this class will prove a better investment or greater convenience for the lumber yard man than the ordinary ripsaw depends materially on the requirements of his trade. If he thinks he can develop among his customers work enough of the class calling specifically for bandsawing it may prove a great drawing card, but if the work be confined largely to ripping, working up scrap, and supplying special dimensions in straight line stock the ripsaw is the better investment.

Office System for the Yard*

Systems, like all else in this world, are subject to the laws of change, and what may be a good system this year is an obsolete and poor one next year. So one must be awake to all new ideas and methods that prove advantageous, and be ready to cut out the old and adopt the new whenever it is shown to one's advantage to do so. Our great world of commerce to-day is a grand and living monument to the word system, and the greatest advance that this age has made over that of our fathers and forefathers is due to our better systems of doing business.

The twentieth century will go down in history as an age preeminent in systematic commerce. Necessity is said to be the mother of invention. It is likewise the mother of new and better systems in business, as our business has grown and become more complex, we have been forced to discard the old accounting system of our fathers, that of the blackboard and vest-pocket memorandum, and have instituted the loose-leaf ledger, the typewriter and the adding machine. The miller no longer keeps his accounts with chalk on the side of his mill, but he has many books, ticket machines, and files of all kinds. Till, to-day the modern miller knows to the pound the quantity of wheat it takes to produce a barrel of flour, or a bushel of meal.

I do not know of any infallible office system to suggest to you in running a retail yard, as a good system for a country yard might not be altogether applicable to the running of a large city yard and vice versa.

There are no hard and fast rules that one may dictate to be applied to all kinds and sizes of lumber yards, though certainly there are some general and fundamental laws of system applicable for all. Office systems should be as simple as is compatible with efficiency. Do not wrap and infold yourself with red tape simply for the sake of the tape, if two books will keep your books satisfactorily, then do not use four or six. Use the shortest system you can that will work efficiently, for, after all, books are kept that you have a correct account of what is owing to you and what you owe others, and the shortest system one can invent that will accurately keep these two accounts is the best system.

Personally I prefer the triplicate ticket system, that is, all original charges or entries are made on the ticket machine, one ticket going to the customer, one placed on your desk file, and the third is left on the roll in the machine. These tickets, as you know, are numbered and you charge them each day to their respective accounts in the ledger, then file same. This method if desired will eliminate the journal; another advantage of the ticket system is this—instruct all your drivers, your yard manager, and all employees that sell lumber, that under no circumstance is any waggon to leave the yard without the driver having a ticket. This will insure all lumber or material leaving yard being charged, which to my mind is the most important part of any office system; that of getting a complete and correct record of all merchandise sold.

In any town of 5,000 or more population I would rather have annually the purchase price of merchandise sold and not charged than the net profits of any one business in that town. This statement to you perhaps sounds somewhat large, but I believe that if there were any way of securing statistics on the question you would find the statement conservative. All of this annual loss to merchants is due in a large measure to slipshod methods or lack of any regular system of charges, if the true reasons for commercial failures could be known you would find 90 per cent. of them attributed to bad credits, slow collections, and a lack of system in doing business. Any yard doing a large credit business will make some bad accounts; that is to be expected, and should be figured in your cost of doing business. But no lumberman if he takes advantage of the lien law should lose in excess of one per cent. of his credit business.

Any good office system includes the sending of monthly statements of amount owing and due, and if the statement of account does not get your money then write them a letter, but under no circumstance permit the time to expire on doubtful accounts without asserting your lien. It costs $1 to record, and often saves you hundreds. A correct stock sheet is most valuable to the retail lumberman. A correct stock sheet is not much trouble to keep, and the satisfaction of looking it over and knowing each day just what your yard and sheds contain and what items you are short on and in need of buying far outweighs the small work of keeping it. Without a stock sheet the best memory will forget, and when you think you are heavily stocked on some sizes and grades you will find upon investigation that you are either out or nearly so, and that invariably happens when you have a customer for 1,000 feet or more of that grade. Whereas had you kept the stock sheet you would have known just when you were getting low and bought accordingly. Never wait until you are out of any size or grade to buy. Shipments are too slow and uncertain these days for that.

We have recently been reading much in the lumber journals anent the cost of doing business, and it is astounding how few retail lumbermen seem to know the actual cost of doing business. Any office system that does not include the keeping of account so that they can tell accurately the exact cost of doing business is faulty, and I would suggest that a change of bookkeeping be made at once.

Many a lumberman has sold his lumber at 10 per cent. gross profit and suffered the illusion that he was making money. The lumberman that tells me he is selling lumber at an average of 10 per cent. and making money recalls this story:

A minister strolling down the street met a small boy and girl playing on the sidewalk; being in a communicative mood, he said:

"My young fellow, what relation are you to the little girl?"

"She ain't no kin to me," replied the boy.

"But she must be," said the parson, "you have eyes alike, and resemble in too many features not to be related."

"Don't make no difference," said the lad, "we ain't no kin. My father is her father and my mother is her mother, but we ain't no kin to each other."

The parson, somewhat puzzled, turned to the little girl and said: "How is this, my little girl? This boy says you have the same father and the same mother, and yet are no kin. I can't understand that."

"I can explain it," replied the girl, "he's just lying."

I have recently figured the cost of doing business for my firm for the year 1910, and it totals just 16⅔ per cent., which I think any lumberman will say is low.

The Tapering Wedge Dovetail Glue Jointer

MAKES solid furniture panels that are stronger than the natural wood — you can't break them in the joint. This joint has all the features of any ordinary "V" or flat joint; besides it has twice the wood surface and the tapered dovetails are perpetually holding the boards together.

SAVE four-fifths of your jointing costs and all lumber waste by doing it automatically at one operation on the

Linderman Automatic Dovetail Glue Jointer

With this machine in your factory all that is necessary is to feed the lumber into the machine from both ends, and it is dovetail taper jointed, glued, united, and the panel sized to exact width at a capacity of 40 to 60 feet per minute

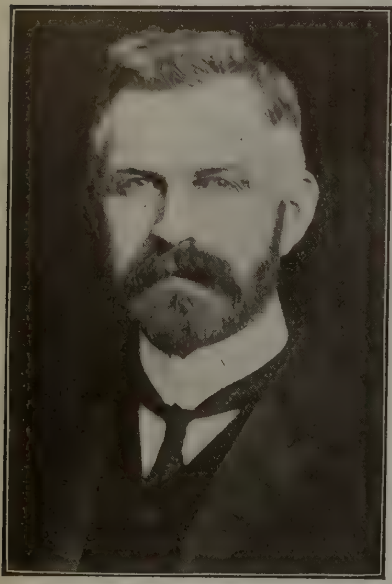
Machinery and Equipment

What Manufacturers of Logging, Sawmill and Woodworking Appliances are Doing

A Steel Range Pioneer



Adam Hall, Peterboro, Ont.

Lumbermen in every part of Canada who have for years been buying camp ranges from Adam Hall, of Peterboro, Ontario, will be pleased to hear of the success that has attended his business career. For the past 33 years Mr. Hall has been a leading citizen of Peterboro, and in addition to being engaged in the retail stove. house furnishing and plumbing business, is also the pioneer Canadian manufacturer of steel ranges for lumbermen, railway contractors and hotels

The manufacturing end of the business has grown so rapidly that Mr. Hall recently decided to give up the retail trade and devote his full time to manufacturing. With this end in view he recently formed a new company to be known as Adam Hall, Limited, and the manufacture of the steel ranges and heaters will be carried on more extensively than heretofore. The officers of the new company are: Adam Hall, president; and his sons, W. T. Hall and Adam L. F. Hall, vice-president and secretary respectively.

In addition to extending the stove works last summer, Mr. Hall also built and equipped a large foundry so that the new firm are in a good position to fill orders promptly. They are also building several new lines of heaters, and are prepared to furnish lumbermen not only with stoves and heaters, but also with a complete line of camp utensils, particulars of which will be found in their catalogue.

Fair dealing and the maintenance of high quality have been factors in Mr. Hall's business success. Not long ago, while on a trip through Northern Ontario, a representative of the "Canada Lumberman and Woodworker" asked a member of a leading camp supply firm if they sold Adam Hall's ranges. "Yes," was the answer, "we have ben dealing with Mr. Hall for many years, and we have always found him even better than his word."

It is the intention of the new firm to uphold the previous good record of the business and to add new lines to their list from time to time.

The Wm. Cowan Company, manufacturers of woodworking machinery, of Galt, Ont., report that they are enjoying one of the best business seasons they have ever known. They have recently made extensive additions to their already large plant and are still working night and day to keep up with the rush of business.

"The Proper Treatment for Floors, Woodwork and Furniture," is the title of an attractive booklet issued by S. C. Johnson & Son, Racine, Wis., in which they describe forcibly the advantages which are secured by the use of their excellent variety of artistic wood finishes. The booklet is attractively illustrated in colors and will appeal strongly to any who are interested in the matter of securing the best results along these lines.

"The Burroughs Bookkeeping Machine in the Lumber Business" is the title of a well prepared booklet which has been issued by the Burroughs Adding Machine Company, of Detroit, Mich., and Toronto, Ont. The booklet, which is cleverly and attractively illustrated, tells clearly and briefly of the advantages of such a machine and points out conclusively that it can be used by lumber companies to greatly reduce and systematize their accounting work.

The Mathews Gravity Carrier Company, of St. Paul, Minn., U.S.A., have established a Canadian agency at 83 Richmond street, Toronto. in charge of Mr. F. A. Francois, as local manager. The product of this firm consists of gravity carriers of various designs used for conveying brick, lumber, boxes, barrels, etc., between any two points in a factory or yard. It is especially useful for loading and unloading cars, as it does away with hand labor, considerably reducing handling expense. Automatic elevators, spirals and chutes are also provided for use with the gravity carrier. The invention has proved a great success in the States, and the demand for the Company's products has become international in its scope, as evidenced by the fact that last year, manufacturing rights were secured in England with executive headquarters in London. The company confidently expect the Canadian field to prove very profitable

---

A Useful Woodworking Machine

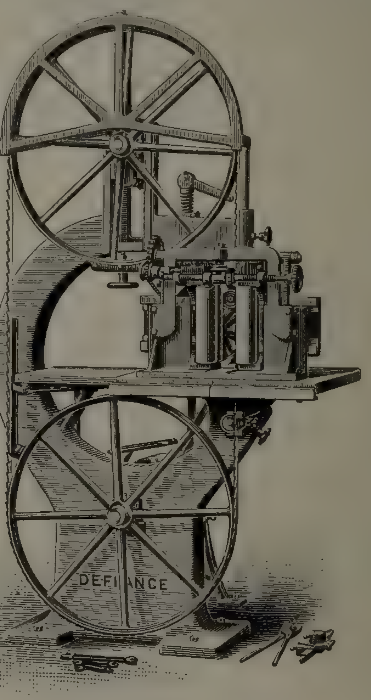
The accompanying illustration represents the new No. 6 patent 36-inch band, scroll, rip and re-sawing machine manufactured by the Defiance Machine Works, of Defiance, Ohio, U.S.A. This machine is most conveniently arranged for doing various ginds of band scroll sawing, ripping and re-sawing lumber. It is a combination of three machines in one, and can be changed in a few moments from one class of work to the other. It is suited to the very finest scroll sawing required in piano and organ factories, pattern shops. and by fancy woodworkers, etc., as well as the heavier kinds of work, such as sawing plow beams, wagon and carriage wood stock, agricultural implements parts, ship and car work, sawing hard wood with a saw blade as wide as 2 inches. All the adjustments on this machine are so perfect that it can be run constantly without injury to the saw blade or the machine.

The frame is of modern design, cast in one piece, with cored centre, making it strong and reliable, and is provided with a broad floor base to stand firm.

The saddle supporting the upper wheel is accurately fitted to the frame in planed and scraped angle-ways, it is adjustable vertically by hand-wheel and screw to accommodate various lengths of saw blades, taking at the longest a saw 18½ feet.

The saw wheels are 36-inch diameter, 2½-inch face, covered with solid endless rubber bands, ¼-inch thick, which are ground true and given a running balance by patent method, making them capable of running at a high rate of speed entirely free from vibration.

The patent tension device is provided with a compression spring in connection with the upper wheel, which provides the exact amount of tension to the saw under all conditions, instantly accommodating itself for light or heavy sawing, unlike the old-style weight affair, which is cumbersome and slow to act. It is a well known fact that a spring will act 100 times quicker than a weight, which means that the spring tension will meet and correct 100 variations in the strain of the saw while the weight is getting in motion to take care of one, and very likely, because of its inertia, missing that. The saw will cut perfect work only when the tension is accurate. By a single hand screw, the upper saw wheel can be tilted while running to lead the saw to any path desired over the face of the wheels.



A New Defiance Product.

The table, of iron, is 30 inch by 34 inch, planed true and arranged to tilt at 45 degrees angle for bevel sawing. The top is laid off in inches and fractions and fitted with a patent rip saw gauge, to be used for ripping lumber. This gauge can be instantly placed on or removed from the machine. Patent non-friction guides are used above and below the table, and are warranted by the manufacturers not to heat or injure the saw blade.

The re-sawing attachment consists of four vertical feed rolls, all powerfully driven, with three changes of feed to saw 20, 30 or 40 feet per minute, and it will accommodate material up to 12 inches wide by 4 inches thick, or any sizes under, and it will saw the stock parallel or bevelling and to any thickness required.

This machine measures 36 inches from the inside of the frame to the centre of the table, giving ample room for wide sawing. When the guide stem is lifted to its highest position, it will take work 12½ inches thick. All spindles are of ground steel and run in long self-lubricating bearings.

The tight and loose pulleys are 14-inch diameter, 4-inch face, and provided with an improved belt shipper, to be operated from the front side of the machine, and they should run 500 turns per minute. The loose pulley is fitted with bronze bearings and a self-oiling device. Three horse-power drives the machine and the floor space occupied is 42 inches by 60 inches.

Lumber Matters in the Law Courts

Settlement of Long Standing Dispute Regarding Right to Pollute Stream—Water Level Case Determined in Quebec

Pollution of Stream.—The right of a sawmill owner to pollute the stream beside which his mill is located, was the subject of a case which recently came before Mr. Justice Latchford. The plaintiff, Hunter, owned a lumber mill on Constant Creek, in the township of Grafton, and brought action against the defendant, Richards, owner of a mill above the plaintiff's on the same creek, to recover damages for injuries done to plaintiff by defendant in fouling the stream and obstructing the flow of water to the plaintiff's mill, by throwing refuse into the creek. Mr. Justice Latchford held that although the defendant may have acquired a right by prescription to pollute the stream, the amount of pollution permissable under the prescription was regulated by the amount caused by the mill in its primitive condition when it was built in 1855. Since that time the mill had been greatly enlarged and a large amount of modern machinery had been installed. This greatly increased the amount of pollution resulting and Mr. Justice Latchford held that, inasmuch as the defendant recognized this fact by making several payments from year to year to the plaintiff in consideration of the increased pollution, the plaintiff was entitled to judgment to the extent of $200 and costs, and to an injunction restraining the defendant from discharging refuse into the creek to the injury of the plaintiff. The operation of the injunction was suspended for four months to enable the defendant so to alter the mill that no additional damage should be done.

Right to Water Level.—The Jonquiere Pulp Company have won their suit against the Chicoutimi Pulp Company regarding the water powers on Lake Kenagami in the county of Chicoutimi, P.Q. The action was taken to prevent the Chicoutimi Pulp Company from taking more than a certain quantity of water from Lake Kenagami, and to sanction certain rights which the Jonquiere Pulp Company claimed, to keep the waters of the lake at a certain level during winter as well as summer. Judge Letellier, who heard the case, decided in favor of th Jonquiere Company. The issue was a most important one as it involved the continuance of the extensive building operations which Price Brothers and Company, Limited, have commenced at Jonquiere, and which, it is stated, will now be carried out as rapidly as possible.

Pulp Operations in Newfoundland

Operations around Grand Falls, Newfoundland, will, this season, be on a more gigantic scale than ever before. At Bishop's Falls, about 20 miles from Grand Falls, the Albert Reed Company are ready to start the manufacture of pulp and paper, and 1,000,000 logs are now at the plant and ready for use. When the fine weather of the usual late Newfoundland spring sets in, one of the large buildings will be extended for the working of "wet" machinery, and for the first year only, pulp will be manufactured and exported mostly to England. The plant will be added to after that, upon an extensive scale, and it will take a large staff of builders and other mechanics from 18 months to two years to complete the new buildings which the company will erect. Around these mills is springing up a little city. The company have had 1,000 men in the woods the past winter cutting from the inexhaustible supply of pulp lands in the company's domains.

At Grand Falls this year the Anglo-Newfoundland Development Company are enlarging their already enormous paper mills. Two more paper machines and two new digesters, with three new boilers, have been put in. Last year 900 tons of finished product was turned out weekly, which will be greatly increased this season.

With these two giant companies operating practically in the same vicinity, the drain on the pulp lands is enormous, yet it apparently has made practically no inroad upon the properties. With the excellent system of reforestation adopted, Newfoundland will bear out the claim that it is undoubtedly, for its size, the greatest pulp producing country in the world.

Searching for New Forest Reserves

With the object of determining what new portions of Canada's forest resources should be set aside as new government reserves, parties will be sent out by the Forestry Department this summer to the Peace River country, British Columbia, and parts of Manitoba and Saskatchewan. A party will also leave about May 1st for the Hudson Bay, to inspect the timber along the line of the projected Hudson Bay Railroad. The organization of the new Rocky Mountain reserve, which comprises the whole eastern slope of the range from a 4,000-foot elevation to the summit, has begun, Mr. Edgecombe, of the department having left recently to commence it. Mr. Knechtel, Dominion inspector of reserves, is now in Calgary organizing a fire ranging force to protect it. Trails will be cut through and eventually telephone lines installed. A survey will also be made of the Porcupine hills, at the south end of the Rockies, which it is considered should form part of the new reserve.

Disappointing Trade at Glasgow

Messrs. Cant & Kemp, Glasgow, under date of April 1st, report as follows:

The timber trade during this year has been disappointing, the volume of business being very limited. It was expected at the beginning of the year that with the labor troubles ended, an active demand would very soon set in, particularly for shipbuilding material, but the enquiry from this source has been somewhat restricted. The imports have not been heavy and in some items the stocks show a reduction as compared with the figure at 31st December last. Shipbuilders are now well employed, and it is expected that the demand for the various woods required in this industry will soon show an improvement. The enquiry for housebuilding and cabinet making woods continues very slow, while the demand from waggon builders has only been moderate. Prices are firm, with an upward tendency. The Quebec shippers have paid their annual visit, but contracting has been done on a very limited scale as compared with a few years ago.

Waggon oak planks.—There is a light stock composed chiefly of second grade wood. The enquiry has been moderate, and the import consists largely of contract parcels. Quotations for consignment parcels are 2/3 to 2/8 for first grade and from 1/5 to 2/- for lower grade —all according to specification.

Quebec yellow pine waney boardwood.—The stock is light, and the import so far this year has been nil. The demand has been moderate, and very high prices have been paid. First class lots are scarce.

Quebec square yellow pine—The stock is light with a moderate enquiry. Prices are very high.

Quebec red pine.—The stock is nil, with hardly any enquiry.

Quebec oak.—The import has been nil, and the stock has been somewhat reduced during the last three months. The demand has been wholly for first class lots, and which command good prices. Lower grade timber is most difficult to sell.

Quebec elm.—The stock is light and prices are firm, with a fair consumption. Shippers are demanding higher prices for contract lots.

Ash.—The stock of logs is exhausted, with a fair enquiry for first class lots, chiefly for Quebec parcels. Values are improving and shippers are quoting higher prices for contract parcels. Quotations, 1/6 to 2/6 per cubic foot, according to quality and specification.

Birch.—The import of logs has been moderate and almost entirely on contract. The stock is almost nil, with a fair demand. Quotations are 1/9 to 2/6 per cubic foot. The stock of planks and boards is much reduced, with a moderate enquiry. Quotations are 1/2 to 1/10 per cubic foot, all according to quality and specification.

Quebec yellow pine deals, etc.—The stock is somewhat lighter than at 31st December last, while the demand during the last three months has been limited, particularly for first class quality. Good sidings have been in fair request, and parcels of wide specification have been frequently enquired for. Quotations are as follows, viz.: Firsts—Broads, 4/6 to 4/10; Regulars, 4/3 to 4/5; Undersized, 3/- to 3/4. Seconds—Broads and Regulars, 3/- to 3/6; Undersized, 2/3 to 2/6. Thirds—Broads and Regulars, 2/- to 2/3; Undersized, 1/9 to 1/11. Fourths—Broads and Regulars, 1/8 to 1/10; Undersized, 1/6 1/6. Good sidings—3/10 to 4/6, all per cubic foot according to specification.

Quebec red pine deals—The stock is light with only a limited demand. Prices are fairly firm.

Quebec spruce deals.—The stock is moderate and the enquiry fair. Prices are firm. Quotations are—9-inch and up, 1/2 to 1/4; 6 to 8 inch, 1/- to 1/1—all per cubic foot The demand for pine is dull.

Lower port pine and spruce deals.—The stock is moderate, with a fair demand for spruce. Quotations are—9-inch and up, 1/- to 1/3; 6 to 8 inch, 1/- to 1/1—all per cubic foot. The demand for pine is dull.

Pitch pine.—The stock is considerable, and the demand very limited for both shipbuilding and housebuilding specifications. Quotations are very fitful, and may be named at from 1/4 to 1/8 per cubic foot for from 30 to 40 cube average.

WANTED & FOR SALE DEPARTMENT

PUBLISHERS' NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line ($2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same adverticement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Employment Wanted" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies.

Advertisements of "Employees Wanted" will be inserted at the rate of two cents a word net. Cash must accompany the order.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

WANTED—LUMBER, ETC.

Lath Wanted

We want to buy, for cash, all the White Pine and Spruce Lath, all grades, that you have. Communicate quick with Allegheny Lumber Company, Pittsburg, Pa. 9-10

Lumber Wanted

Have you any stock which you wish to sell? If so, make the fact known to probable buyers by placing an advertisement in the Wanted and For Sale Department. Address Canada Lumberman, Toronto.

Wanted

4-4 to 12-4 Log Run Birch, Maple, and Elm. Spot cash paid for stock as loaded.

AMERICAN WOODS CORPORATION,
Old South Building,
7-10 Boston, Mass.

Tank Lumber Wanted

We require 2-in. and 3-in. Tank White Pine, 6-in., 7-in., 8-in. and 10-in.; 10 ft. to 24 ft. Also red pine. Highest prices for Pump Squares. Ontario Wind Engine & Pump Co., Ltd., Toronto, Ont. 7-tf.

Spruce Limits Wanted

Wanted to buy Spruce and Pine limits in Eastern Canada, 100 to 250,000 acres. Option must be granted. Principals only, no agents. Apply Sieveking, Podmore & Wright, 57 Grace street, London, England. 8-11

Lumber Wanted

We contract and pay the highest cash price for hardwood lumber stocks. Take the entire car, large or small and dry stock for immediate shipment. Reply to Box 250, Canada Lumberman, Toronto, One. 7-10

Wanted—Ash, Elm and Oak

Wanted to purchase, for export shipment, Ash, Elm and Oak. Kindly state price and point of shipment. Address, with full particulars, Robert Cox & Company, Hope Building Ottawa, Ont. 9-12

Lumber Wanted

We will pay cash for Basswood, Soft Elm, Birch, Hard Maple and Black Ash, in straight or mixed car loads. All thicknesses. Johnston Lumber Company, John Street, Toronto. 9-10

WANTED

One to Two Million feet of Basswood, Elm, Ash, Pine and Cedar logs and ties delivered of your mill in good Birch, Spruce and Basstoulin Island. State price and quality expected. Box 177, Canada Lumberman, Toronto, Ont. 1-tf.

Lumber Wanted

Would like to hear from mills having Spruce Lumber, Lath and Cedar Shingles to sell, which can be shipped to New England territory. Would contract for mill cut or handle on commission basis. Address with full particulars. Wendell F. Brown Co., 38 Kilby street, Boston, Mass. 5-10

FOR SALE—LUMBER, ETC.

For Sale

3,000 Cedar Posts, 4 in. to 8 in. at top end and 8 feet long. R. J. McAfee, Cookstown, Ont. 9-9

For Sale

Sixteen thousand second grade ties, in good shipping condition, on Grand Trunk Railway. Apply Box 251, Canada Lumberman, Toronto, Ont. 7-10

Lath for Sale

Lath for sale, large quantities of No. 1 and 2 white pine lath for shipment, either by water or rail. Wilson Bros. Limited, Collingwood, Ont. 7-10

Cedar For Sale

Cedar posts and poles, any size posts sorted to suit your trade, any length or size poles. Ready for immediate shipment. Address, T. A. Wilson, Cannington, Ont. 9-10

For Sale

Several cars of 1-in. No. 2 Barn and better White Pine; 200,000 ft. 3-in. good Hemlock, largely 13 ft. Rail or water shipment. B11 Board of Trade Building, Montreal, P.Q. 9-14

For Sale
Hardwood and Hemlock

If you want to buy Hardwood or Hemlock or Ties, Posts and Shingles, visit limits and make an early contract. Pay as work progresses. Can get you 5 or 10 million feet of each on Georgian Bay. Box 266, Canada Lumberman. 9-16

For Sale

50,000 ft. 1-in. M.C. Ash.
5,000 ft. 1¼-in. Mc. Ash.
40,000 ft. 2-in. M.C. Ash.

FOR SALE—MACHINERY, ETC.

For Sale

One Berlin Matcher, No. 94, practically new. Wilson Bros. Limited, Collingwood, Ont. 7-10

Saw Carriage for Sale

For sale, one three block saw mill carriage in good condition with track complete. John Harrison & Sons Company, Owen Sound, Ont. 9-9

FOR SALE

Small Band Sawmill, Waterous make, complete with filing room tools, and Gang Edger, Live Rolls, Slab Slasher, Shingle Machinery, Shafting Gearing, Etc., also, Dynamo and Motor. Also a large number of factory Machines, comprising Matchers, Moulder, Band Rip Saw, Variety Saw, End Matcher, Shafting, Belting, Shaving Exhauster and Pipes, Dry Kiln with Steel Cars, Engine and Boiler, Etc.

2-tf. JOHN FINDLAY, Owen Sound.

WANTED—EMPLOYEES

Advertisements under this Heading two cents a word per insertion.

WANTED—A first-class edgerman; state experience and wages expecteed. Can give work at once on repairs. Mill starts about May 1st. Dryden Timber & Power Company, Limited, Dryden, Ont. 8-9

WANTED—First-class head sawyer for circular sawing mill cutting from ten to fifteen thousand. Services to commence between first and fifteenth of May. Apply Box 195, Jordan, Ont. 9-9

WANTED—Lath mill employee, a good strong man that can come well recommended as an A1 Lath Tier. Address, James Woodwork, care Cleveland-Sarnia Saw Mill Company, Limited, Sarnia, Ont. 9-9

WANTED—Shingle sawyer for Perkin's Favorite machine, day or job, also packer, also stationary engineer, no certificate required; good season. Apply to J. C. Murphy & Company, Tobermory. 9-10

WANTED—Manager for a lumbering company. To an active, experienced, capable man, a liberal salary will be paid. Apply by letter to E. R. C. Clarkson, Chartered Accountant and Financial Agent, Toronto, Ont. 8-9

WANTED—EMPLOYMENT

Advertisements under this heading one cent a word per insertion. Box No. ten cents extra.

If you want an employee for any branch of the lumber or woodworking trade the best, quickest and cheapest way to get him is by placing an advertisement on this page. Canada Lumberman and Woodworker, Toronto, Ont.

A young man, of good appearance, education and address, desires clerical position in the lumber trade, has had good experience and wishes to settle in Ottawa with some firm of repute. Age 27, teetotaler and of good habits; quick and accurate at figures. Box 264 Canada Lumberman, Toronto, Ont. 9-9

BUSINESS OPPORTUNITIES

For Sale

Saw mill, 40 h.p., portable, with small limit. Considerable other timber available for sawing. Box 386, Parry Sound, Ont. 8-9

For Sale

Saw Mill of 30 to 35 M. feet daily capacity, complete with engine, two boilers and lath machinery. For particulars write to E. D. Croden, Box 596, North Bay, Ont. 3-tf.

Sash and Door Factory

Partner wanted with $5,000 to $10,000. Practical man to take full charge or will sell on easy terms. Apply Box 259, Canada Lumberman, Toronto, Ont. 7-12

Timber Limits For Sale

Can be quickly and profitably disposed of by advertising them on this page. This is where buyers of timber property look for opportunities to invest, if your "ad" is here the investor will see it. Canada Lumberman, Toronto, Ont. tf.

For Sale

Steam Sawmill and Planing Mill and about seven million feet of standing timber for sale in the township of Christie, on Grand Trunk Railway, 12 miles from Parry Sound. For terms and other particulars write S. Armstrong, Assignee, Parry Sound, Ont. 7-10

Timber and Land Investment

Farm of three hundred acres within 35 miles of Toronto—one hundred acres of which is timber land—Pine, red and white Oak, Maple, Beech, Basswood, etc. Balance of farm is under cultivation, thirteen acres bearing apple orchard. Buildings cost over five thousand. Price, $29,000. Box 160, Canada Lumberman, Toronto, Ont. t.f.

Steam Saw Mill For Sale

For Sale—Small Steam Saw Mill, complete with trimmers and lath mill, capacity 15,000 feet per day. Price, including mill frame of sawed pine timber, $1,500 f.o.b. cars. Reply to C. H. Sheppard, Waubaushene, Ont. 7-11

Salesman Wanted

Large American firm making Adjustable Cutter-Heads and Dado Cutter-Heads, wants to get in touch with good salesman calling on manufacturers of furniture, interior finish, bank and office fittings and mantels, who can sell cutter heads along with regular line. Man connected with saw and knife trade preferred. Apply E. J. McIntyre, 4059 Perry street, Chicago, Ill. 9-10

SAW MILL, TIMBER LANDS, MINING PROPERTIES, ETC.

Saw and planing mill, capacity 30 M. in 10 hours; six thousand acres timber, 70 million feet; mill and timber $70,000. Farm with good residences with cattle, hogs and poultry, 3,000 acres freehold land; $30,000. A responsible purchaser with about $25,000 cash can handle this, balance of payments spread a period of 10 years, or more if desired.

Also several mining properties, iron silver, gold and lead, on half share for development work.

Saw and planing mill, capacity 40 M. in 10 hours, splendid situation, rail and water transportation. Mill and plant with several good residences. and fruit orchard, price $60,000. 10,000 acres virgin timber lands, estimated to contain over 100 million feet, price $50,000.

Terms—$30,000 cash, balance in easy instalments. Owner retiring from business. Apply Box 258, Canada Lumberman, Toronto, Ont. 7-12

MISCELLANEOUS

Mill and Timber for Sale

1,100 acres, well timbered with birch, hemlock, pine, basswood, spruce and cedar, together with new lumber and shingle mill, steam feed, large frame boarding house close to mill, situated on railway siding. Must be sold to close a partnership. Excellent opportunity for small mill man whose supply of timber is cut out and is looking for a new location. Stock of certain length now in yard. Get busy, this is a snap for some one. For further information apply to Box 531, Orillia, Ont. 6-9

A Saw Mill Wrinkle.

In a southern saw mill the timber all comes by rail, with a goodly amount of mud and gravel sticking to it. The derrick loads the logs on a car in the yard, and at the foot of the incline the car is stopped for a short time, and a stream of hot water from an injector cleans off nearly all the mud, and softens what it does not get off. The mill averages something over 20,000 feet a day, mostly quarter-sawed, and saws are changed three times a day. The forced stream of water from an injector is better than cold water, and the saws are saved at a trifling expense.

Ball Bearings for Wood Working Machinery.

Although the advantages of well-designed and constructed ball and roller bearings have been recognized in the engineering world for a good many years, it is only of comparatively recent date that they have been introduced into woodworking machinery. When ball bearings were first constructed there were a good many cases of failing owing chiefly to the balls not being absolutely alike in size and interchangeable, and the ball race or housing being more or less untrue a perfect rilling contact was impossible, but as in these days high grade ball bearings are guaranteed by the makers to some .00025 of an inch, this difficulty has been practically overcome, and we venture to predict that when their advantages are fully appreciated they will be much more largely used in connection with woodworking machinery.

Owing to the increase of speeds and feeds on many woodworking tools of late. the wear and tear on the bearings has become increasingly severe, hence the necessity of bearings that will reduce the working friction and consequent power consumed to a minimum.

When ball bearings are correctly constructed and proportioned to withstand the duty and load they have to bear, it has been found — after lengthened trials that the wear on them is very small indeed, and at the same time the amount of lubrication required is very largely reduced. Another advantage that can be claimed is that any wear that takes place is practically confined to the balls and inner races, and that the spindles themselves are not worn, as is the case when ordinary straight hard metal bearings are used.

The first cost of ball bearings would undoubtedly be more than for ordinary bearings, but this is rapidly overcome by the increased saving in power, lubrication, etc., and we therefore look for their extended introduction into woodworking machinery in the near future.

Circular Saw Accidents.

Probably more accidents arise from circular saws than all other woodworking machinery put together, and although mechanical guards protect the operator to a large extent, it is impossible to devise one that will entirely prevent the careless man from bringing his hand in contact with the saw. A good many accidents arise, however, from the asw throwing back pieces of wood, which often inflict serious injuries on the operator, and these can to a large extent be guarded against by suspending a board from overhead and letting it hang down to nearly the top of the saw, and should a piece of woodwood be carried over it strikes the board instead of the man. This may appear a simple matter, but in these days when so many claims are made against employers, anything that will tend to lessen their liability should not be neglected.

Belts and Blunders.

One of the most curious cases of breaking in a pulley was recently noted in a large factory where the heavy machine the pulley was on was driven by a belt with a tightener. The driven pulley on the machine broke at the rim where it joined each one of the arms, and each arm broke clear across. The tightener, in this case, was hinged on the floor, and the pulley was partly wrapped by the belt when the machine was stopped. A little carelessness in holding off the tightener let the belt rub too close, and in a little while the smell of burning leather called attention to the defect. The pulley was so hot on the rim that it was burning the grease on the inside of it, and the dust that had collected inside was on fire. A bucket of cold water put out the fire, but when the machine was started the rattle of the rim called attention to the fact that all the arms were broken at the rim on the inside. Of course, one swallow doesn't make a summer, but that tightener was in the wrong place. But, like the man who spelled socks "sox," if it suited the owner, it ought to have pleased the supply man who sold him the new pulley.

Right Way to Put on Spliced Leather Belts.

The general opinion has always been that the correct way to put spliced belts on the pulley was to place them so that the splice or joint would run on the pulley side and against the splice on the outside of the belt. The inside can take care of itself, as the joint is kept smooth by the contact and pressure of the pulleys (especially is this the case where any belt dressing is used.) It is always the outside of a splice that opens up and causes trouble. In running over the pulleys the tendency is to open the splice on the outside and close it on the inside. After the thin edge once starts to open the air is forced under it (as it runs thin edge first on the outside) and it soon becomes detached. Instead splice belts should be run with the splice on the pulley side so as to offer no resistance to the air on the outside of the belt.

Review of Current Trade Conditions

Ontario.

The improvement in the weather which has been noticeable during the last week or two has materially assisted the lumber trade in Ontario. This is particularly noticeable in the demand from across the border. One Buffalo firm reports that its business during April was as large as during the three previous months. Other firms corroborate this report. Trade, however, in the Northern States and in Ontario is rather quiet, as a result of the retailers having already laid in fairly ample stocks and being now in a waiting attitude. It will probably take some weeks for them to make materially holes in their supplies, and no great rush for stock is anticipated. A fair average trade is under way in practically all lines and there are no price changes to note. The demand for B. C. shingles continues active, and the price of XXX is steady at $3.30. An occasional sale is reported at a little less than this figure, but $3.30 is the most general price. The demand for shingles is stimulated by the activity among the farmers who are now in the market for shingles for repair work, being anxious to get their work all done before haying time.

As usual, the trade in the higher grades of white pine is good. Stocks in first hands are practically out of existence. This applies also very largely to most of the medium grades. The low grades also are pretty well picked up throughout Ontario. Hemlock continues unchanged, though many of the retail yards are reported to be disposing of it without profit. There is a decided scarcity of 16-foot lengths. A fair demand for lath is reported, particularly for the low grade. The upper grades are showing a slight tendency towards sluggishness.

A traveller who recently covered the southwestern part of Ontario reports that in all the important consuming centres, with the single exception of Woodstock, he met with excellent trade. In Woodstock the inactivity was accounted for by the backward weather and the bad condition of the roads. In Hamilton, London, St. Thomas and Brantford he met with an excellent and increasing demand. The building activity in Hamilton, he reports, is greater than he ever knew it before at this time of year. So far as prices are concerned, he reports that they are practically unchanged. Lath are very strong and scarce, and shingles, he stated, are strong but uncertain, there being a range in the retail price all the way from $3.30 to $4. At the former figure the retailer is disposing of the stock without profit.

The month of April in the Ottawa trade was rather quieter than usual. Towards the end of the month, however, trade improved and a good demand is expected. The outlook for the building trade is encouraging and there is a noticeable decrease in stocks in manufacturers' hands as compared with other years. This applies particularly to stocks of mill culls, which a year ago were something of a drag on the market, but which are now pretty well cleaned up.

Eastern Canada.

Montreal exporters are expecting a good season's trade during 1910. Prices at present are firm, and expected to advance. At the moment, the most active lumber is birch, which is scarce and sells at high prices. The demand for birch from the United States is strong and is regulating export prices in general. The principal demand in the United States is for automobile rims or felloes. Montreal exporters who have recently visited England, report that the outlook there is not very promising. The shipbuilding trade, however, is quite active, and trade in general is doing well. England, however, is now obtaining a great deal of its timber from Russia, and getting it cheaper than it would from Canada. The lumber trade in Montreal is reported as rather slow. The backward spring is interfering seriously with the opening up of operations.

A large volume of business and a firmer market for eastern spruce are reported by Boston retailers. Opinions are rather different as to the course of prices to be expected during the summer. Frames 9-inch and under are selling at $23.50 to $24. There is only a moderate demand for random, although prices are firmer. A slightly increased activity is noted in the demand for covering boards and prices are a little firmer. Eastern spruce at New York is doing well. An improvement is reported in the building trade and retailers are making numerous inquiries for stock. The demand for hardwood at Buffalo is lighter than usual at this time of year. The yard trade is less active and retailers are content to wait till prices become normal. Maple and birch are in fair demand, and plain oak is fairly steady.

Great Britain.

The timber trade at London has been rather quiet during the last fortnight. The spot demand continues at a good level, although the building trade is still only a consumer. Temporary buildings for the coronation, and the demand for the packing trade have, however, kept things moving. An increase is also expected in the export figures for the month of April. For the week ending April 8th, the deliveries at London docks amounted to 4,022 standards, as compared with 3,749 standards during the corresponding week of 1910. At the auction sale recently held by Messrs. Foy, Morgan & Company, 2nd Quebec regular spruce sold at £11 and £10 15s. 10 and 11-foot brought £10, 3 by 8, 10 and 11-foot, £9 10s. 3 by 7, 3rds, sold at £9, and £8 15s. 2 by 7, 1sts, brought £12. In Quebec pine, 3 by 11, 3rd 12 and 13-foot, sold at £16 10s., and 11-foot brought £15 10s.

The holiday season at Liverpool interfered considerably with the extent of trade. No general improvement is making itself felt at present, but it is confidently expected shortly. The average market is stiffening and at the present, tonnage, from New Brunswick and Nova Scotia ports to Liverpool is quoted at 2s. and 6d. to 5s. per standard higher than a year ago. The Canadian pine deal market remains unchanged. Stocks are moving off slowly. Consumers are probably holding off in the expectation of easier prices later on. They are likely to be disappointed in this regard, as stocks purchased at Ottawa have been at full prices. In some cases, in fact, the prices have been higher than a year ago. Birch from St. John and Halifax, both in logs and planks, continues scarce and dear, and there is a strong demand particularly for birch planks of good quality. Timber arrivals have been more plentiful during the last fortnight.

At Manchester the holiday season had the effect of rendering the market inactive. The tone of trade, however, is considered healthy and in no on department is there any sign of weakness. Floorings have hardened to a c.i.f. basis of £9 17s. 6d., and £10, and there is no inclination to accept lower prices. The general belief is that spruce deals will not be any cheaper, at least for a few months. Dock stocks are being held firmly and the spruce situation is strong. Anything in the nature of 11 by 3 inches in 18-foot lengths or thereabouts can be sold at £12 per standard, ex stocks. Pitch pine has improved considerably. Stocks are light and only good prices will bring forth sales. There is a splendid demand for birch planks. The supply is practically nil. At present they could bring fully 18d. per cubic foot. In practically every direction, timber values are firm. The indications are that during 1910 Manchester firms will experience an excellent trade. Housebuilding at present is stagnant, but trade in general is quite active. At Bristol, imports have been confined to a few liner parcels, which have not stirred the trade to any extent. A meeting of property owners was recently held at Bristol at which the general opinion was expressed that beyond any question the long period of depression was coming to an end. Signs of a revival were noted and a general feeling of optimism was expressed.

A fair volume of trade is in progress at Glasgow. Stocks in first hands are being gradually diminished and in a few staple lines a shortage is already apparent. The opening of the Quebec season, however, is expected to have an important effect upon the market at Glasgow, which will depend entirely upon the extent of consigned goods sent forward. It is probable that these will be rather light and that higher prices will result. Not only are supplies reported rather short in Canada, but shippers are not inclined to make consignments at current prices. Stocks of spruce at Glasgow are light and very little has come forward of late. The demand, however, is not very active. Prices have kept very firm. Oregon pine, spruce deal, birch, and pitch pine have been moving fairly well.

United States.

A number of cross currents seem to be affecting the lumber markets of the United States at present. It would be a very difficult matter to give a correct general impression of the trade. There is one noticeable feature, however, namely, that scarcely anybody is laying in stock for future trade. Purchases in general are for immediate use. The increased activity in the Eastern States, resulting from the development of the building season, is largely counteracted by the decrease in the demand in the middle west, which is probably the result of the farmers being closely engaged with planting. Labor troubles and weather conditions have had a good deal to do with the decreased sale of lumber during the last fortnight. This has been the case particularly at Chicago, where plumbers and steamfitters have held up building operations to a great extent. It is confidently expected, however, that the advent of spring weather will stir up the trade in general. Building operations have been quite heavy and consequently retail yards will have to replenish their stocks shortly. The demand for northern pine at Chicago is smaller than a fortnight ago, but the prices for all upper grades are strong and steady. A fair trade in box shooks is in progress, but prices are not very satisfactory. There is a good demand for pattern lumber. There has been a great increase during the last few weeks in the demand for low grade hardwoods. No. 2 and No. 3 plain red oak are especially active. Stocks of No. 3 are reported low. Plain red oak is holding steady in the upper grades and the general impression is that an advance is likely. Good plain oak is quoted at various prices. Dry stock is scarce and the situation is rather confusing. Quarter-sawed white

J. M. Diver, General Manager
E. C. Barre, Assistant Manager

oak is in fair demand only. There is good inquiry for Michigan birch, and maple, and for maple flooring, which in many cases is sold by manufacturers a long way ahead.

Occasionally shipments of hemlock by lake are being received at Chicago, and stocks in the yards are being replenished. It is reported that mill stocks are badly broken and that manufacturers are asking better prices. The price of southern pine at Chicago has softened a little. Occasionally an odd item in dressed stock is being offered at $1 under the list. The demand for heavy construction timbers, however, is steady. No. 3 boards are moving well and mill stocks are reported low. No. 2 dimension is also active. Price advances in these stocks would not be a surprise. Red cedar shingles are again lower in price at Chicago and are being offered at $3.07 for clears, and $2.59 for stars. Even at these prices the sales are infrequent. Lath are steady. The cooperage industry at Chicago is reported extremely dull.

An increased trade in northern pine is reported from Buffalo, resulting largely from the building activity. Higher grades are scarce, and are quoted at firm figures. Many of the yards have had a rather dull spring, although some have been quite active. Most of the yards, however, are now finding business of fair proportions. Quite a large amount of stock has been ordered for early lake shipment.

There is not much change to note in the hardwood markets at Buffalo. A fair volume of business is in progress and prices continue strong. The most active woods are birch, maple, and plain oak. Maple flooring is rather quiet at unsatisfactory prices, the result largely of competition. The increased building activity at Buffalo is helping the sale of hemlock, and a good average trade is expected this spring. Supplies of lake hemlock have been ordered by some dealers and this will soon commence to arrive. Prices are not likely to show any change. Southern pine at Buffalo is meeting with an active demand. The Buffalo shingle market shows no improvement. Red cedars are selling at a very close margin. Lake supplies are not expected yet for several weeks.

Market Correspondence

Ottawa Valley Trade Encouraging

Ottawa, April 25.—The marked delay in the building operations in Eastern Ontario owing to the very late spring has resulted in a very quiet April among retail lumbermen, which, in turn, is felt by the manufacturers and wholesalers. However, the last two weeks in April have been a great deal more active, and a good demand is anticipated from now on. There will be much building in Ottawa during the coming months, particularly of the class which requires large amounts of lumber. Many contracts are being let now for summer cottages which will be erected on the parks that have street car access to the city. These, of course, are almost entirely of wood.

A strong indication of the confidence with which retailers view the future lumber trade of this city, is their desire to establish branch planing mills in various sections of the city. It has already been announced that the W. C. Edwards Company and Cummings Brothers are building mills on the Britannia line west of Ottawa and now George M. Mason Company have secured a site in the same section, and will begin the construction of a mill on May 1st. There will be four or five machines installed as soon as possible and it will cooperate with the main mill on Wellington street. There is very little change in the prices with the retailers as compared with those of last spring, except that perhaps the cheaper grades are a trifle firmer.

With the manufacturers, the outlook is bright. The best grades for export advanced during the winter from 8 to 10 per cent., and in mill culls and box lumber, while there is no noticeable advance, there is a much better demand. Mill culls last year were somewhat of a drag on the market, and a year ago many manufacturers still had much of this variety unsold. It is entirely different this year. Throughout the Ottawa valley practically all the mill culls held by the manufacturers has been disposed of.

Driving Operations may Commence Late.

The Ottawa river is still tied up with ice, and men from up the river state that it is yet almost firm enough to carry a team. It will probably be some time before it will be cleared sufficiently to permit towing. In this connection it is interesting to note how greatly the changes are from year to year in the time the Ottawa river breaks up. The Hull slides open as soon as towing operations begin on Lake Deschene. In 1906 they opened on April 17th, in 1907 on April 26th, in 1908 on May 4th, in 1909 on April 29th, and last year as early as April 8th. The present indications are that this year the date will be later than any of these.

A few drivers are being sent to work on the Ottawa river. The wages paid so far have been $42 a month, which is considered low, and the employment agencies expect to pay nearly $2 a day very soon.

Considerable improvements have been carried out on the tributaries of the Ottawa this winter both by the lumber firms which operate on them and by the government. The result will be that the drives will not last as long as heretofore. It is estimated that they will be about all over within a month after the driving starts, except in isolated cases. Kippewa and Petawawa rivers have been the scenes of the greatest improvements.

J. R. Booth's men have built piers and placed guide booms across Mountain Lake on the Montreal river to keep the drive logs from scattering on that water. The company have about 50,000 cords of pulp logs to go from that point. Of this amount about 200,000 pieces came out of Bear creek, necessitating considerable work being done by the Township of James in strengthening the Bear creek bridge built by the township council last year.

Montreal Exporters Expect Good Season

Montreal, April 24.—Mr. E. H. Lemay, speaking of the export lumber trade, reports that the prospects are very good and the season likely to open with prices firm. Trade with England would appear to have better prospects at the moment than that with the United States, although in both cases things look brighter than they did a year ago. Mr. Lemay is a strong supporter of the reciprocity agreement and says that if it passes it will make the lumber trade hum.

Another prominent lumber exporter states that birch is the only timber that is on the move at the present time. This wood, he says, is very scarce, and prices are correspondingly high. The American market is making the new prices, while the English market has not followed the trend of events. Canadian dealers can get $4 a thousand, board measure, more in the United States to-day for the best grades than they could some months ago. Last year, dealers could buy log run, dead culls out, at the mill for $16, whereas the same quality now brings $19.50. In high grades the increase is much more noticeable. This dealer says that last year he sold a hundred thousand feet of thick birch at $28. The same timber to-day brings $41. There is so much difference between the English and American markets that one shipment which was consigned to an English firm has been transferred to Philadelphia buyers before being shipped and in this case the original consignees are reaping a profit of a dollar a thousand and the Americans are glad to get the output at the additional figure. English prices will have to be increased if the firms in the old land intend to get any of our new cut.

The English market demands the heaviest lumber, as the wide board is the fashion over them. In this country the big trees are constantly getting farther from the railway track, which means increased expense in getting them out. The unusual demand then comes in and the price is further inflated. Practically only light timber and the cheaper grades are left for our market and as a matter of fact smaller goods will be sent to England this year than have ever gone over before in any quantity. This will apply to square birch as well as to deals. Reports state that building operations in the United States are not unusually brisk this season and if there is such a demand under those circumstances it would appear to follow that still higher prices are inevitable.

Another reason for the rise in the price of birch is the fact that it is being put to a number of comparatively new uses. A process has been discovered by which it can be treated so as to give it a mahogany finish, including both color and hardness, which only experts can detect from the real thing. Birch is also now largely used in the manufacture of "mission" furniture as it readily takes almost any stain. It is becoming popular as a material for bars and counters and in many instances it has been used for yacht decks, but perhaps the one purpose to which it is being most largely devoted is the construction of automobiles. It is being used to a great extent for making the rims or felloes of automobile wheels. One Montreal dealer recently received an order from a single Philadelphia firm of automobile builders for 290,000 feet of birch for this purpose and they want big stuff—not less than 4 and 5 inch stock. This size timber is growing scarce in Canada, and it is practically unobtainable across the line.

A lumber exporter who has just returned from England reports that dealers over there are very pessimistic. He reports building operations to be very slow, although he says the shipbuilding trade is good. On the whole he found a lot of general business in progress. Speaking of lumber, particularly, he said that England was getting a good deal of its timber now from Russia. That country was sending in various kinds of timber cheaper than it could be got from Canada. 1. All signs point to a backward season, which will affect all departments of commerce as well as the lumbering business.

So far as Montreal is concerned the lumber business is still very slow. The river has not yet broken up and one company reports that the streams their mills are on will be at least three weeks later in breaking up this year than they were last. Captain Bourassa, Deputy Harbor Master, states that he scarcely expects ocean liners, or steamers from Quebec, to be able to come up to Montreal much before May

Improved Trade in Great Britain

Liverpool, April 20.—At the principal ports of England and Scotland at which cargoes of timber are received and distributed, business continues to improve slowly. At London, the special demand on coronation account, is keeping up an active movement of planks, scantling and boards suitable for stands and barricades and has proved very timely to the trade. Special importations of timbers for coronation uses are being made, and the goods received on this account are competing with stocks on hand The consumption for this special purpose will, however, be great, so that merchants will derive much benefit from it. A demand for planks and scantling on coronation festival account has arisen in other cities; in connection with special gatherings and demonstrations which are to be held to celebrate the event; and which will be attended by large concourses of people. From the present time onwards, until the middle of June, the demand for wood suitable for barricades, platforms, stands and seats, for coronation events will continue, so that a large consumption of wood, in the aggregate, will have been caused.

As showing how the coronation will quicken business in the timber trade in different braches, it may be mentioned that upwards of 6,000 chairs of a special design, have been ordered from makers at High Wycombe, for use in Westminster Abbey on the occasion of the coronation. Weeks ago, permits for the erection of fully 1,000 stands, in Westminster, had been obtained. Many of these stands will be provided with chairs, so that chairmakers in the London district will do well. An extra demand for birch and ash has arisen in connection with the event, for chairmaking.

Spruce has been in better demand and a fairly active delivery from yards has been maintained. Prices remain at practically recent figures. Birch, also, has sold more freely, but stocks are still light. Quebec, 4-inch birch, has sold lately at 1s.7d, and Montreal 2-inch at 1s.6d. to 1s. 3½d. per cubic foot.

At Liverpool, spruce continues in good demand and liner parcels find ready buyers on arrival. Birch still sells freely, and arrival parcels are eagerly inquired for, and bought ex quay. Stocks have been much reduceed. Plank birch has sold on a larger scale and the stocks of this class of wood have also been reduced. Recent sales have been at higher prices. Ash has been in largely increased demand and stocks are now small, though the importation haes ben on a larger scale. Pitch pine has been in very fair demand, sawn wood especially being taken. The deliveries of this wood and of planks have lately been on a large scale, but hewn has been inactive. Oak has sold more freely, the demand for oak for waggon building having increased. Stocks have been much reduced, Canadian and United States logs and planks being in comparatively short supply. Sales continue on the larger scale and the outlook for business in this wood has much improved. Coffin oak is also in short supply, and first quality planks coming to hand would find eager buyers, and would bring comparatively high prices. Walnut of all kinds has been in good demand and high prices are being paid for wood of medium to first class qualities. Satin boards have been freely inquired for, but sales have been restricted owing to the high prices asked.

At Manchester, trade generally has further improved. Spruce deals are in larger demand and prices are very firm. Liner lots find ready buyers and apparently are wanted for immediate use. Quebec board pine has been in moderate request, and so has square pine. Birch logs have sold rather less freely, though the consumption through the first three months of the year, shows a large increase. Planks have been less inquired for, within the last two weeks, but for the first three months of the year they, too, show a largely increased consumption.

The Caledonian Railway Company have decided to add 1,000 new waggons to their stock. Half of the number are to be built by the company at their own works, St. Rollox, Glasgow, and the second five hundred by R. Y. Pickering & Company, Wishaw; and Hurst & Nelson & Company, Motherwell. The building of this lot of waggons for the Caledonian Company will keep the demand for waggon oak active, in Scotland for some time.

Messrs. Denny, Mott & Dickson, Limited, report from London, Eng., under date of April 1st, as follows:

Canadian timber—Waney pine.—Consumers are contracting forward, and the limited supplies are being rapidly absorbed, so that stocks of first class timber will be difficult, and probably impossible to obtain later in the year. Elm is also being purchased for forward delivery by consumers, and prices are firmer. Oak continues the weak spot, and although the annual railway enquiries are still to be filled, there seems a poor prospect for marketing this wood.

Spruce—Some business has been done for early cargoes, and stocks now show some reduction in comparison with last year's figures, whilst the consumption has somewhat improved.

Pitch pine—Whilst prices continue to be cut very fine, leaving only a narrow margin of profit, the stocks are healthier in the chief importing centres. If shippers do not force forward shipments, a re-

Plant of American Ball Bearing Co., Cleveland, Ohio, covered with J-M Asbestos Roofing.

ROOFING AS PERMANENT AS THE FOUNDATION

The only ready roofing to which this applies is J-M Asbestos. It is the only one made from indestructible asbestos (stone) fibre combined with Nature's wonderful weatherproofer, genuine Trinidad Lake Asphalt.

J-M
ASBESTOS ROOFING

has no skin coat of paint or gravel surface to wash or wear off. It is a permanent roof, and never has to be painted.

Add to this its wonderful fire-proof qualities and you will readily see why it is in a class by itself.

Note the blow-torch test. Any other ready roofing would burn up in a few minutes if subjected to this test.

A postal to our nearest branch will bring you samples, Catalog No. 303 and full information by return mail.

In this test the flame of a powerful blow-torch was placed within two inches of J-M Asbestos Roofing. At the end of fifty minutes the roofing was not burned or injured, being only slightly blackened by smoke.

Stocks will be sawn at Biscotasing, Ont., C.P.R. main line and at Spanish (Georgian Bay).

currence of the past year's disappointing trading should be avoided, but not otherwise.

Oregon pine—In the absence of any large imports, the stocks are being reduced to more healthy dimensions; and the outlook is sounder than it has been for some time past.

London Deal Prices Continue High

Merrs. Churchill & Sim, London, Eng., in their monthly wood circular, give the following information regarding shipments from Canada up to March 31, for the current year:

There has been no importation from the St. Lawrence.

From New Brunswick, etc., the figures are: Pine deals, 17,000 pieces, against 23,000 pieces in 1910; spruce deals, 88,000 pieces, against 206,000 pieces in 1910; birch planks, 57,000 pieces, against 94,000 in 1910.

Retail sales are the order of the day in the better class of pine deals, and no wholesale business is possible at the heights to which prices have attained. The supply of spruce is smaller than usual, and prices show some firmness, but any upward movement is checked at once by the cheap Russian supply. Birch planks have been enquired for, and some improvement is noticeable here, as the quantities available are smaller than usual. The stock of birch timber is disappearing, but the demand for oak and elm is very poor, and the stocks quite adequate.

The supply of sawn pitch pine timber has been limited to one cargo during the month, but the stock remains small. Prices have been quite steady and the quantity of timber of reliable quality available here is not excessive. Quotations from the shipping ports eased slightly towards the end of the month in sympathy with some concessions in the rates of freight, but the demand continues good. A fair quantity of deals and boards arrived during the month and met with a better demand, so that the stock is a little lower than it was in February.

Encouraging Outlook in Nova Scotia

Sawmill operators in the counties or Anapolis, Digby, Yarmouth, and Shelburne, Nova Scotia, are much encouraged over the lumber outlook for 1911, says a U. S. Consular report. During 1909 considerably over 100,000,000 fet of lumber were cut in the district; but last year the cut was not over 70,000,000 feet, which shortage was due to the mild winter and slight snowfall in 1909-10. Operators were unable to get logs to the rivers, and what they did get were expensive, much wagoning having to be done.

The past winter has been an ideal one, with much snow, and the ground frozen hard for several months. Six or seven of the largest operators have cut and got to the river from one-third to one-half more logs than in 1909, and considerably more than twice last year's supply; moreover, the saving in getting them to the waterways was considerable. All the mills anticipate a busy summer's work.

The best information attainable indicates that the 1911 cut will be at least 1,250,000 if not 1,500,000 feet in the four counties. The only complaint now heard from the big mill men is about help, which is quite scarce, as a large number of workingmen from this section have gone to the Canadian west during the past six or eight months.

S. P. Musson, Son and Company, Barbados, report under date of April 1, regarding lumber, as follows: White Pine—The only arrival during the fortnight is a small lot of 27 m. feet, ex schr. "Minnie F. Crosby," from Halifax, which consignees have not yet offered. There have been, however, several cargoes sold to arrive, which are on the way, and one or two are also coming on consignment. Spruce—Arrivals consist of the schr. "Basile' from Meteghan with 196 m. feet which had been sold to arrive at $26.50 for merchantable, the trn. schr. "Minnie F. Crosby," from Halifax, with 150 m. feet, sold at $26.50 for merchantable, and a small lot of 48 m. feet ex "Sobo" which was sold at $24.50 round. Dealers are now fairly well supplied and we hardly think present prices can be maintained. Pitch pine—No arrivals, but supplies are expected. Shingles—The trn; schr. "Annie E. Banks" arrived on the 30th inst., with a cargo of 1,400,000 Extra No. 1 cedar laying shingles of very superior quality, which were sold at $2.20. No receipts of Long Gaspe. Shooks—Receipts consist of 100 bdls. puncheon shooks, and 1,042 bdls. barrel staves, imported on dealers' account, and there is a sail cargo on the way from Portland. Wood hoops—The "Dee" from London brought down 400 bundles which were imported by a dealer.

Charles W. Goodyear, of Buffalo, N.Y., head of vast enterprises in lumber, railroading, iron, steel and coal in Pennsylvania, Michigan, Minnesota, Louisiana, Mississippi and New York, and an employer of thousands of men, died at his home on April 17. As head of the Goodyear Lumber Company he had established an enviable reputation in the lumber industry throughout the United States and was also widely known in Canada.

TALK NO. V.

It is absurdly easy

to make a lot of fine resounding assertions about the "AMPHIBIA" Water Proof Belt. Any man with an extensive vocabulary could do that about any weak-knee'd proposition.

But we're out to convince you, so here's a definite offer.

We will send to any responsible firm

ONE "AMPHIBIA" BELT

on trial and if it fails to do as we state, it can be returned and no charge will be made.

Now, advertisers sometimes make offers which have a nice open-handed appearance, but which it would'nt pay them to get accepted.

But our offer, as outlined above, has been accepted and

Not one belt has come back

One customer says that it lasts five times as long as any other belt he has ever used.

Enough to make you think, eh?

Remember, "AMPHIBIA" is waterproof and made from first-class oak leather.

EDGINGS

Ontario

Port Arthur, Ont., received tenders up to April 29th for 1,500 sound standard jack pine ties.

The McAuliffe Davis Lumber Company, Ottawa, have purchased all the Shepard & Morse Company's stock of spruce. This stock runs to lengths of 32 feet, etc.

An extra-provincial license has been granted by the Ontario Government to the Lake Superior Paper Company, Limited. The capital of the company to be limited to $4,200,0000.

The Interior Hardwood Company, of Berlin, Ont., are erecting an addition to their factory, 40 x 50 feet, three stories high. The whole of this addition is necessary for present business.

The box factory of the Parry Sound Lumber Company, Parry Sound, Ont., was destroyed by fire on April 25th. The plant, which was one of the best in the province, will not be rebuilt.

Negotiations are under way for the establishment of a match factory at Port Arthur, Ont. The plant will employ 100 hands at the start, and the output will be handled by a Winnipeg firm.

The Fort Frances Pulp & Paper Company, Limited, Toronto, Ont., has been incorporated with capital of $501,000. The incorporators named are: W. Bain, R. Gowans, H. Chambers and R. M. Coates, all of Toronto.

The Rat Portage Lumber Company report that they have not as yet formed any plans for rebuilding their mill at Rainy River, Ont., which was recently destroyed by fire. They do not believe it likely that they will do anything in this direction this season.

The Peterboro Lumber Company's mill at Burnham Point, Ont., started full operations last week. The mill employes from 80 to 125 hands. The season promises to be a very busy one. The McDonald Lumber Company will also start their mill this week.

It is reported that organization work is rapidly progressing in connection with the new sash and door factory which is to be erected at Sarnia, Ont. It is expected that in the near future work will commence upon the plant. A suitable site has already been selected.

Arrangements are under way for establishing a factory at Fort William, Ont., for the manufacture of a lumber loader patented and invented by Albert Forest, of Duluth. The Northern Engineering Supply Company, of Fort William, have secured the manufacturing rights for Canada. J. M. Paton is manager of the Northern Engineering Supply Company.

A large block of property at Woodroffe, on the Britannia line, has been purchased by the Geo. M. Mason Lumber Company, of Ottawa, for about $9,000. It is the intention of the company to build a small planing mill to supply the growing needs of the summer resorts along the Britannia line. The rest of the property will be occupied by a lumber yard.

The Ontario Gazette announces the incorporation of the York Lumber Company, Limited, with capital of $40,000, and head office at Toronto. The provisional directors are James Baird, T. L. Monahan, and K. F. Mackenzie, of Toronto. Among the objects of the company are, to manufacture and deal in lumber, pulp and other forest products, and to engage in planing and dressing lumber and the manufacture of articles of all kinds, in the making of which lumber is used.

No bids received for the Fort Frances and Abitibi pulp concessions were satisfactory to Hon. Frank Cochrane, Ontario Minister of Lands, Forests and Mines, and he has anounced that the lands, timber and water privileges will remain in the possession of the Crown for the present. It is understood that the conditions of purchase requiring the erection of mills and prompt development were responsible for the unsatisfactory nature of the bids. The Fort Frances area covered 800 square miles and a mill costing at least $350,000 was required to be erected on the property. The Abitibi area consists of one million acres, and a pulp mill costing at least $500,000 was stipulated for it.

The Standard Chemical Company, of Canada, have bought out the Standard Lumber Company, of Longford Mills. The company was formerly known as the old Longford Mills Lumber Company. The mill has a capacity of about six million feet per year. The purchase includes the company's limits, consisting of about 45 acres of freehold, and located in Longford Township, about 20 miles from the mill. The Standard Chemical Company operates a mill also at South River, Ont., which they built about two years ago, and which is about the only mill in Ontario that runs all the year round. In the winter this will runs with a double shift day and night. This is rendered possible by the use of a hot pond.

Eastern Canada

Larose & Cie., Montreal, sash and door manufacturers, are stated to have dissolved.

The Edward Partington Pulp & Paper Company, Limited, St. John, N.B., has increased its capital by $200,000.

A meeting of the creditors of A. E. Hamilton, Limited, woodworkers, of St. John, N.B., was called for April 21st last.

Fire which broke out in the engine room of the Peel Lumber Company's mill, at Florenceville, N.B., on April 13th, damaged the plant considerably. The walls of the engine house were badly damaged and the roof fell in. The carriers caught and were half burned down. The loss will be covered by insurance.

In the Quebec Legislature a bill has been passed setting aside the sum of $18,000 for the protection of forests. This is a new move on the part of the province, and the Minister of Lands and Forests stated that it would undoubtedly be shortly followed by other grants, as the Government has made up their minds to do all in their power to protect the forests from fire. He stated that it was their intention to co-operate with the timber owners and railway companies.

Mr. Seaman's sawmill at Stoney Brook, near Shanklin Settlement, N.B., was burned on April 14. The season's cut had been finished the evening before, and during the night several of the mill crew and C. S. Hickman's woods' crew left for their homes near Shediac. Mr. Seaman succeeded in saving the carriage and edgers, but the belts and trimmer were destroyed. The water being out of the boiler gave the fire a better chance. There was no insurance. Mr. Seaman proposes making repairs at once.

James Dempster, Limited, manufacturers and dealers in door, sashes, mouldings, lumber, etc., North George street, Halifax, N.S., have purchased the business formerly conducted by the estate of the late James Dempster. All the old staff have been retained and the business mill be conducted on an enlarged scale. The following are the directors of the new company: President, H. R. Silver; Henry Roper, W. T. Harris, A. D. Falconer and J. A. Marshall. Mr. A. F. Messervey, who was associated with the old firm for the past twenty years, has been appointed manager.

A Quebec despatch states that an important lumber deal has been concluded betwene a foreign syndicate and the Joly de Lotbiniere estate, respecting the cut of timber on the Joly seigniory in the county of Lotbiniere. The syndicate has purchased the timber cut of 40,000 acres for a period of 40 years, and it is stated that the price paid was $600,000. As the seigniory is the sole property of the July estate, the timber cut is not subject to any restriction as regards exportation. It is also stated that the Joly estate will soon dispose at a good price of all the timber still belonging to it.

The lumber mill owned by John L. Hicks, of Sackville, N.B., situated at Cookville, was completely destroyed by fire on April 20. The mill was one of the best equipped in that part of the province and capable of turning out between 25 and 30 thousand feet per day. It employed about 25 hands. The building continued a lath and shingle machine, planer, etc. The boiler had been bricked in and the roof of the building was of steel to guard against fire. The fire could hardly have occurred at a worse time for Mr. Hicks, as he has over a million feet to saw, all of which he had contracted to deliver at an early date, and it will be next to impossible to get the delivery of a new mill, in time to fill all these contracts, and at this season almost every portable mill is at work. The loss is probably in the neighborhood of $15,000, and is only partly covered by insurance.

Western Canada

The Great West Lumber Company, Red Deer, Alberta, has branched into the retail business.

E. E. Gardiner, Quill Lake, Sask., has sold his lumber business to the Dutton Wall Lumber Company.

The Downie-Aldrich Lumber Company, of Carstairs, Alberta, has been succeeded by the Aldrich-Boyce Lumber Company.

Oakley & Webb, Vancouver, have bought D. H. Campbell's sash and door factory in Kamloops, and will install a new plant.

The J. D. McArthur Company is completing the enlargement of its sawmill equipment at Lac du Bonnet, Man. The logging operations of the company were unusually large this season.

The Sturgeon Lake Lumber Company, Prince Albert, Sask., is negotiating for the rights in Saskatchewan of a wood vulcanizing process which, it is claimed, will dry lumber in 24 hours.

American capitalists made an offer of $500,000 cash for 41 timber licenses owned by the Sunset Mills, Limited, and located on the Adams River, B.C. The owners are Nelson and Coast capitalists, who hold for $600,000. The cash offer was considered, but turned down.

The B. C. Gazette gives notice of the incorporation of the following companies: The Peavine Lumber Mills, Limited; capital $50,000. The Dominion Western Timber Company, Limited; capital, $600,000.

A sawmill is to be put in near Aldridge by H. R. Hazelwood, of Cranbrook, and J. W. Fitch, of Moyie, and 50 men will be employed. The firm has a contract to deliver 200,000 ties to the C.P.R. by November next.

The Canadian Western Lumber Company has been awarded a $140,000 contract by the Grand Trunk Pacific. It will supply six million feet of mixed lumber for construction of 125 stations in Alberta and Saskatchewan.

The sawmill owned by Mr. W. H. Day, corner of Ferris road and Ontario street, Vancouver, was burned to the ground on April 18. The fire was confined practically to the mill building, very little lumber being lost. The loss on the building was partially covered by insurance. Mr. Day states that he will rebuild immediately. The daily capacity of the mill was 25,000 feet.

The head office of the new British Columbia lumber company which is being formed by the consolidation of the Michigan-Pacific Lumber Company and the Michigan-Puget Sound Lumber Company, will be at Victoria, B.C. Mr. M. Hankin will be manager of the sawmill and lumber department, and Mr. J. H. Moore, the new vice-president and general manager, will have charge of the timber and logging department.

Trade Enquiries

The Dominion Government Trade and Commerce reports contain the following trade enquiries. Readers of the "Canada Lumberman" may obtain the names of enquirers by writing us, enclosing stamped envelope, and stating number of enquiry:

376. Wooden handles of all kinds—One of the best known firms of manufacturers' agents in London, England, is anxious to establish connections with a few first class manufacturers of handles of various kinds. Splendid showroom facilities.

380. Lumber—The largest lumber importers in Cartagena wish to be placed in communication with Canadian exporters of same.

381. Shooks, laths, staves and other manufacturers of wood—A Cartagena firm wishes to be placed in communication with Canadian exporters of the above articles.

385. Lumber—A firm of lumber importers in St. Vincent desires to hear from Canadian exporters of white pine, spruce, shingles, etc.

386. Lumber—An established firm in Barbados, now adding a lumber yard, requests correspondence from Canadian exporters.

424. Lumber manufacturers—A London firm who are the patentees of a new system for profitably utilizing the waste products of the lumber industry, desires to enter into correspondence with Canadian lumber manufacturers who would be interested.

429. Handles—A Liverpool firm who imports handles of all description would be pleased to receive quotations from Canadian manufacturers who can fill orders.

The Barnhart Log Loader

has been in successful operation in all parts of the country for twenty years and never caused a complaint. We are now manufacturing a new Barnhart Loader known as **Model "12,"** which is specially designed for use in very heavy timber. This loader is built on the same lines as the old Barnhart Loader now known as Model "10" and which we still continue to manufacture. We are operating lumbermen, producing 200,000,000 feet of lumber per annum and we use the Barnhart Loader exclusively. Could we afford to do so if it were not the best? Write us for prices.

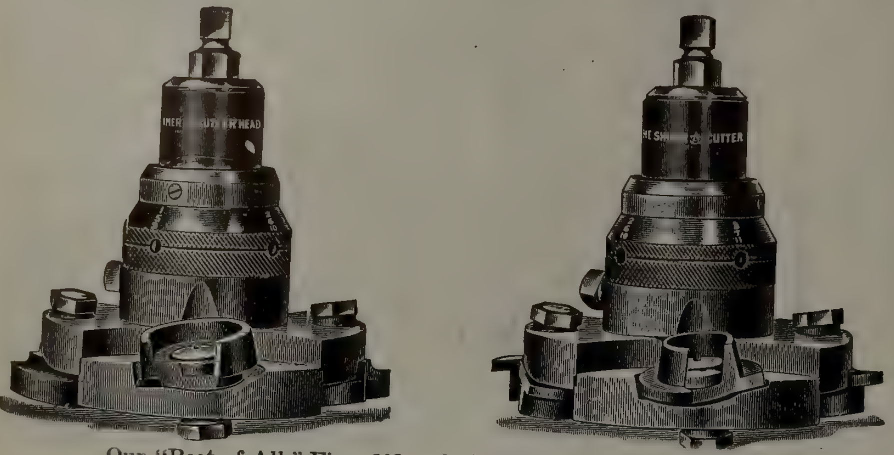
Shimer Cutter Heads and Cutters



Our "Best of All," Figs. 202 and 203 with 4 Bits to each Head

The Better Quality of Greatest Importance!

It is not the price, but the service you get out of a Cutter Head, that determines its value to you or to anyone else.

Shimer Cutter Heads become a permanent investment when put on your machine, because they are built to last indefinitely. There is nothing to wear out about them but the cutters, which can be renewed at small cost when needed.

These tools will bear the strictest investigation. They have the "make-ready" built into them to save time, save annoyance, save lumber and turn out a finished product equal, if not superior, to any on the market.

Look this page over carefully. Consult our Catalog, and see if you do not find a tool that will pay you to invest in to-day.

Rosette Cutter Head

Our new Head and other tools for the purpose of making Rosettes should interest vou if you do any work in this line. The Head is made with interchangeable milled Bits anad turns any substantial wood turning lathe into a Rosette Making Machine with large capacity. Corner and Plynth Blocks with turned Rosettes are always in good style for interior house finish and are quickly and neatly made with this new Head.

Price, Head complete, $11.75.

Filing Stand and Tracker

This is a neat little device to fasten to a work bench for holding a Head when filing the Bits. It holds the Head with a stub spindle and is better than the ordinary pinch vise which, in time, mars the surface of a Head. The Tracker Attachment sets the Bits to share alike in the cutting..

Price, plain Filing Stand	$4.87
Price, Filing Stand with Tracker,	$11.37
Price, Extra Stub	$1.00

In ordering give the number stamped on your Shimer Cutter Head.

We make two styles of Grinding Machines to lighten and hasten the work of the filing room. Particulars sent upon request.

Cutter Head for Matching Reversible Glue Joints

turns out a most satisfactory fitting of the tongue and groove, interlocking from the same piece of matched material, requiring but one Head with Bits to produce. The jointed material will fit together when the pieces are sawed to length by simply turning the one piece end to end.

Glue Joints must depend upon accuracy as well as permanency of pattern. We guarantee both.

Prices range from $15.54 to $17.30 for a four bit Head, and from $19.96 to $22.60 for a Head with 6 Bits complete.

Bolts, Wrenches, Etc.

We carry a full stock of supplies and can fill orders promptly for anything in our line, such as Wrenches, Planer Head Bolts, Nuts, Washers, Gauges, Set Screws, Brass Washers for under Bits, etc.

A Smooth Surface

on lumber as it comes from the machine will save much of the extra labor on the Sander. For several years we have been making a Shear Cutting Cylinder which is now used almost exclusively by some of the large hard wood flooring manufacturers. It has long since passed the experimental stage and will prove all our claims for it. Send for full information.

OUR "BEST OF ALL"

The most popular of The Shimer Cutter Heads are Figs. 202 and 203. The Bits are held within conical duplex bit seats, self-centering, arranged with the very complete Expansion feature for the fine adjustment of tongue and groove thickness.

Price with 4 bits to each head, the set, ...	$40.95
Price with 6 bits to each head, the set	49.27
Price with 8 bits to each head, the set	57.60

Complete with Flooring Bits. The Heads will also receive Bits for thin Ceiling—3/8 at $1.30 each and Bits for 2-in. thick plank at $1.63 each.

JOINTER HEADS

For jointing plain edges we make several styles of Jointer Heads provided with shearing effect to produce the easiest and at the same time the smoothest work. Made of Steel Forgings they supply the strongest and best. Our very reasonable prices put the tools within the reach of all.

Price, with 4 bits to each head, the set, 1¼ in. ..	$31.20
Price, with 4 bits to each head, the set, 2 in. ..	33.28

SHIP LAP HEADS

to give you the best services must be of a kind that is alwayready and to interchange with matcher and other Heads you may have fitted to your machine, thus avoiding a change of machine guides. This is one reason why the Shimer Ship Lap Heads are so generally used. The other reason is that they do work so satisfactorily that all who know their convenience take them in preference to others.

Price, with 4 bits to each head, the set, 1½ in thick.	$34.84
Price, with 4 bits to each head, the set, 2½ in. thick.	35.88

DOUBLE CEILING HEADS

These heads have a special design to suit the purpose of double tonguing and grooving, with overlapping of the bit cutting edges to produce perfect clearance anad to protect the leading points from unnecessary friction and wear.

They double the capacity of any matcher or moulder and provide a means of turning out single surfaced ceiling or flooring upon the most economical basis.

Price, Double Ceiling Heads complete with Bits, net, $40.94

The Shimer Cutter Head for O. G. Batting and Siding

These heads are especially designed to work O. G. Batten or O. G. Siding, having three circular cutters in line of the cut, seated and firmly bolted to one side of the head flange.

We make them to suit any matcher of moulder. They turn out O. G. Battens as regularly as our matcher heads work tongue and groove flooring. Give measurements same as for flooring heads; or, if flooring heads are already in use on your machine, give their record numbers, and send a cross section of the batten --wood sample or drawing.

Price for each Cutter Head, without bits, $9.75. O. G. Batten Bits to mould ¾-in. deep or less, net each, $2.08.

Door, Sash and Coping Tools

That save all the hand fitting. No changing of patterns, therefore, no trouble in framing the door and sash parts when they are matched up with the Shimer Cutter Head. We relieve you of that detail of the business when we place the mould in counterpart within the contour of the Bits. The Bits are filed only to sharpen and being set by means of a gauge give accurate and uniform results. Prices very reasonable.

Reversible and One-Way Cutters

The Shimer Reversible Cutters for Single Spindle Shapers, Variety Moulders of Freizers, are carefully moulded opposite to the shape of the mould to be produced, in such a way as to have only the cutting edge touch the lumber. They are complete—inexpensive—time saving. We also make One-Way Cutters for the Double Spindle Shaper.

Wire Rope

For Every Requirement

We are specialists in the manufacture of wire rope. We can ship from stock any length or size of the wire ropes usually supplied and can manufacture specially a rope exactly suitable for your requirements. Perhaps you are having wire rope troubles—if so—drop us a line advising us your requirements and we will be pleased to make suggestions as to the class and style of rope you should use. We have had years of experience—and should know.

The Dominion WIRE ROPE Co., Limited
MONTREAL

Jeffrey Wire Rope Conveyers

Are used extensively in the lumber industry

Because

They have greater efficiency and are more economical than other types of conveyers.

They are pre-eminently fitted for medium and long distance haulage; are employed with greater success in handling Lumber, Logs, Refuse, etc.

We have conveyors of this type exceeding 1,000 feet in length which are in successful operation.

Write for Booklet 33

We build Conveying Machinery for all requirements in the Lumber Industry.

The Jeffrey Mfg. Co.

A Band Mill Without a Peer

Best balanced and most symmetrical band mill ever designed

The despair of imitators
Built with 6, 7, 8, 9, 10 and 11 foot wheels
Does not overhang its foundation
Is the heaviest band mill built
Also the perfection of simplicity
It holds all the cutting records
Has the greatest range of top wheel
Double spring cushion tension device
Steam straining engine when specified
Quick opening bottom guides
Bottom guide completely buried in husk frame
Safety upper guide
Steam controlled upper guide when wanted
Steel spoke V section bottom wheel
Chain oiling bearings
Hubs are longer than on any other brand
This insures a very rigid wheel
Wheels tilt from front and rear
The standard of excellence
Every feature original with us
We build every machine required in an up to date mill

Dry Lumber

Like you want it ~ *When* you want it ~

Read This Letter

Woodstock, Ont., Nov. 10, 1910

Grand Rapids Veneer Works,
Grand Rapids, Mich.

Gentlemen :—

In reply to yours of the 2nd inst. would say that your Dry Kiln System has been very satisfactory to us. We have had no difficulty in drying perfectly any kind of material we use except rims. It will dry the material all right but the steam straightens them out. It is the only system in our experience that will dry gum box boards without warping. When we put in additional kilns it certainly will be your system.

Yours truly,
THE BAIN WAGON CO. LIMITED
(Signed) John A. Bain,
Vice-Prest. & Mngr.

We have letters from many more Canadian Factories and Mills which we will send you on request. They will tell you how to

MONTREAL

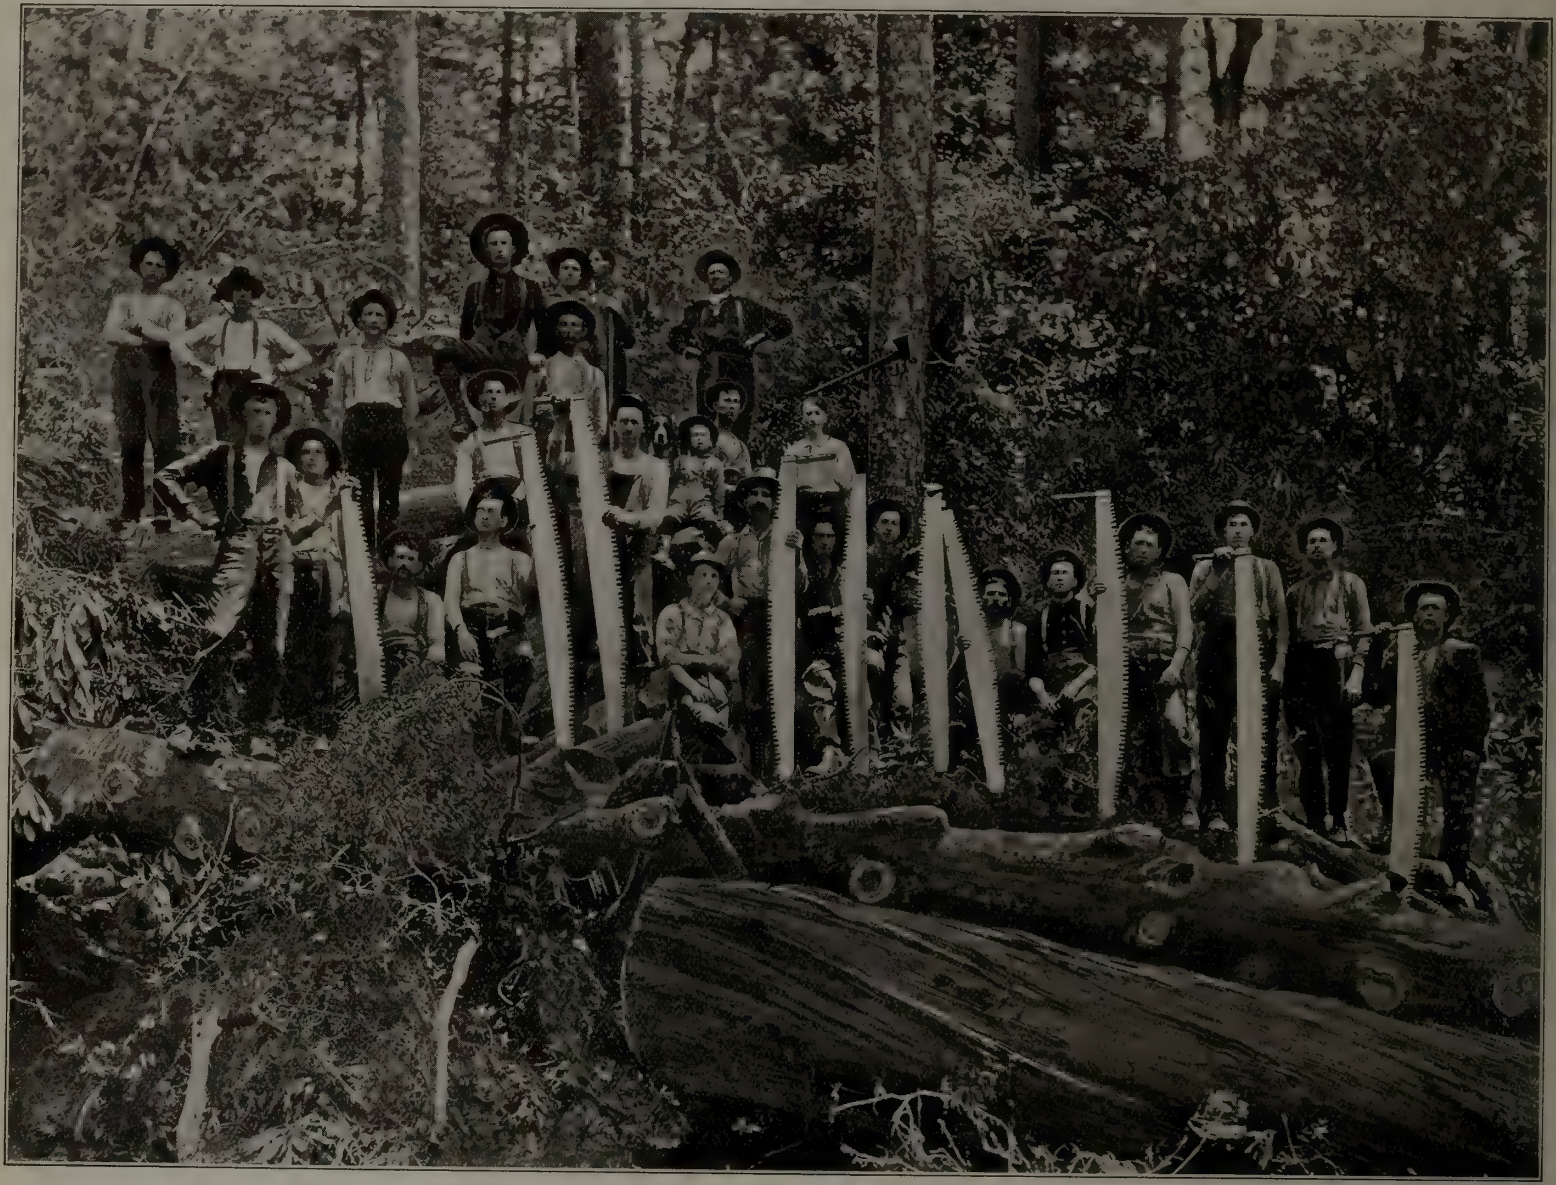
Fenwick, W. Va., June 23, 1910.

Henry Disston & Sons, Philadelphia, Pa.

Dear Sirs:

Enclosed you will find check for the Crosscut Saws. Will mail you photo of the cutting crew and I will say the **Disston Crosscut Saw** is the best Hardwood and Hemlock Saw I have ever used and I have cut timber all my life.

Yours truly,
C. Markly.



In the foreground will be noticed two logs, one of which is of the knurly or spiral grain species, while the other is exceedingly knotty, showing two classes of timber which test the metal, temper and workmanship of saws more severely than any other known class, and as Disston Saws are successfully cutting this kind of timber, it is self evident that they are of the highest quality in every respect, as confirmed by Mr. Markly's letter.

Will You Save Money Now or Then

We should like to send you a picture of a mill where twelve of these machines are at work. These twelve have made good from the start.

Never since they were installed has a man been sent to straighten trouble or has trouble been reported.

Never since their start has anything but splendid results and continuous results been reported.

Now, what are they doing that you are Not. How do they manufacture cheaper and why?

The reason why.

You can run No. 1 Partition, beaded and center beaded at 180 feet per minute and produce lumber that you would be proud to ship.

On two-sided stuff you can run 200 feet per minute and as far as surface is concerned, there is no difference between that and 50 feet per minute.

You can run flooring at 150 feet to 200 feet per minute or up to the limit of the 12-bitted side-heads and turn out perfectly matched lumber.

Drop-siding, moulded base, ship-lap—turned out at 150 feet to 200 feet per minute.

And your intricate cuts like those just mentioned are produced more perfectly than is possible otherwise.

Money is saved.

One little stunt of putting saws on their profiling attachment cut the costs of one company 30 cents a thousand. Could YOU use that saving?

Twelve machines as a labor item are cheaper than thirty of the ordinary type are they not?

Power saved in the operation of the same is cheaper than a miscellaneous number of slow speed tools.

Transmission costs are reduced 66 2-3 per cent and this necessarily saves money.

Belting by the new method of flexible belt tighteners and reduced in the proportions of machines reduced means some saving.

Raising of grades (absolutely guaranteed) which means higher prices and less No. 2 stock puts money in your pocket every time.

Time saved in immense quantities as is done by the new methods results in more work, better work and labor money saved.

YOUR own plant.

You may have one matcher, two matchers, six or fifteen. It makes no difference.

The time to save money is when the method shown is absolutely square and proven beyond question.

Two hundred lumbermen are using "90's" to do this trick. Not one machine has fallen down on the job.

A few years ago, you were satisfied with slow speed machines. Thick knives were all right, square heads were the fashion.

To-day you buy "90's" for the same reason you buy better mill construction, better automobiles, better everything.

It's with the times. You cut every log to-day that makes a 2-4. A few years ago you didn't cut close.

Save as carefully in the planing mill as in the saw mill. You can certainly do it by installing one machine in place of three.

No Inside Moulder.

The day of the Inside Moulder is passed. Why make drop-siding at 40 feet when it can be better made at 150 feet.

Yet to those who think the fast-feet proposition is not necessary, please remember this.

A machine isn't eating up power when idle. If you can do in a half day what you can do now in a full day, couldn't you do more work, better work at less labor and machine cost?

It isn't necessary even to speed a machine up to its full limit. But—when you want to run a carload out fast for shipment, you don't have to say "I'll get it off to-morrow" because you can do it to-day.

Send for Circulars.

It might be a good plan to tell us how much you manufacture and what you use to do it with.

Usually, we are advisors and solicitors only when a man really wants something.

Send for circulars, full data and let us tell you about the machine itself.

USE

Your Mill's Refuse

To Dry and Preserve Your Wood

"The HOWARD" Vulcanizing Process

Positively the quickest and most economical system known for drying and Preserving Lumber, Railroad Ties, etc.

POINTS IN ITS FAVOR:

Improves quality of all lumber
Increases the crushing strength
Increases the transverse strength
Reduces the weight 30 per cent to 45 per cent
It materially prolongs the life of wood
Eliminates shrinking, swelling and warping
Emphasizes and beautifies natural grain of the wood
Makes fit for commercial use woods not otherwise merchantable
Does away with necessity of maintaining heavy stock of lumber in yards
By this process green lumber taken from the log can be used for building purposes in 2 or 3 days

---

We invite Lumbermen and Owners of Woodworking establishments to see a practical demonstration of the process at our plant in Toronto

Our descriptive booklet tells in a most interesting manner the advantages, etc., of "The Howard System." It's yours for the asking

Executive Offices: McKinnon Building - TORONTO

With the Spindles running 9000 revolutions per minute in Phosphor Bronze Bearings with continuous Oil Flow, the best results on our

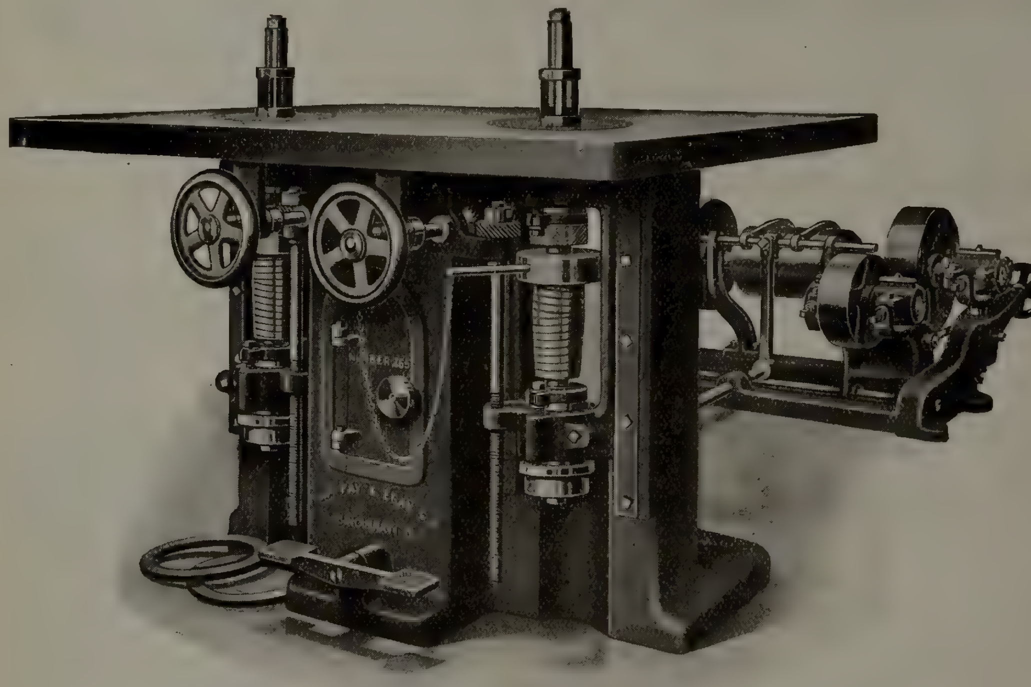
No. 265 Double Spindle Shaper

are attainable

It takes high speed to make a good shaper, and it takes a good machine—good material—good workmanship and good principles of construction to stand a speed of 9000 revolutions per minute.

We have a book called "Section L" which shows our machine in detail. Copy sent free to you gladly.

An item of great value in the construction of our shaper is the countershaft. It's made like the machine itself—heavy, universally adjustable and with double pulleys to insure perfect tracking of belts—very necessary on a high speed machine.



No. 265 Double Spindle Shaper

Referring to our book again—get it please—it only costs a postal to brihg it. State where you saw the ad, so we will make no mistake by sending you the wrong book. **"Section L"** is the one.

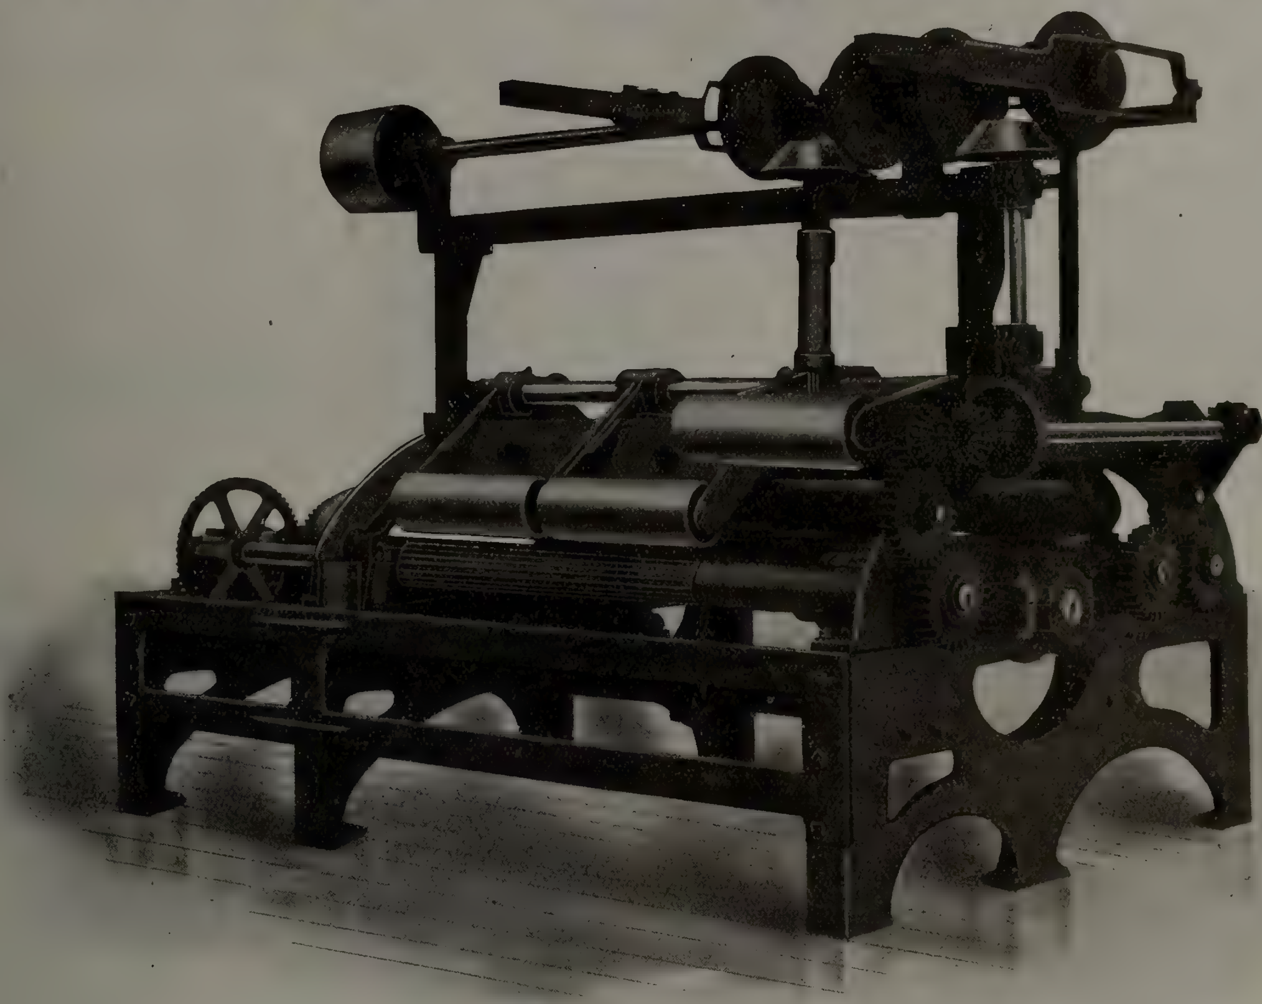
"Jumbo"

Combined Gang and Edger



We have made several improvements since this cut was made, less gearing is used than shown in the cut.

This is a very complete machine and embodies every detail of construction essential to an adequate gang edger.

We have sold a great many of these machines and hear nothing but good said of them. We have some very flattering remarks for our "Jumbo."

Some of its good points are:

MANDREL: 4½ inches by 10 feet 6 inches long.
DRIVE PULLEY: 20 inches by 20 inches.
SAWS: 2 Movable Saws on Edger side (more if desired) 8 stationary saws on gang side. 2 Water Boxes.

This machine is 5 feet 7 inches inside of frame; reverse friction is supplied in case cant binds and prevents saw from being burned Supplied with Press Rolls and impossible for Cant to fly back.

Prices Cheerfully Quoted

MOWRY & SONS **Gravenhurst**

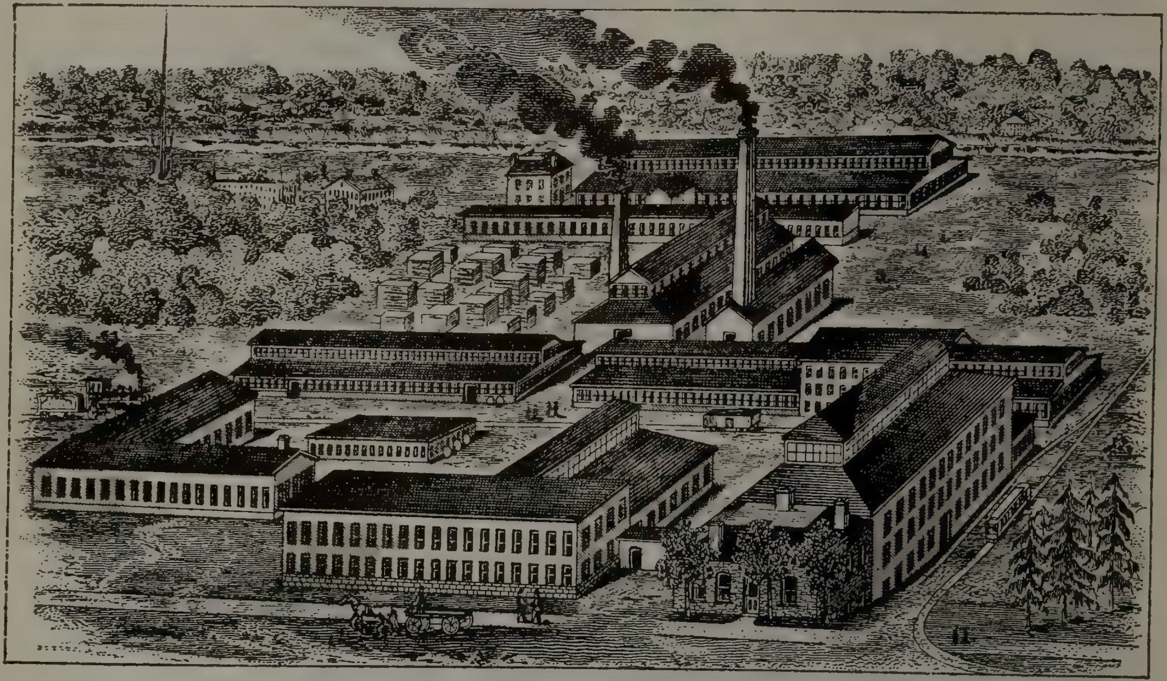
MAPLE LEAF SAWS

The Improved Racer Cross Cut Saw, by Actual Test, is the Fastest and Easiest Cutting Saw Made

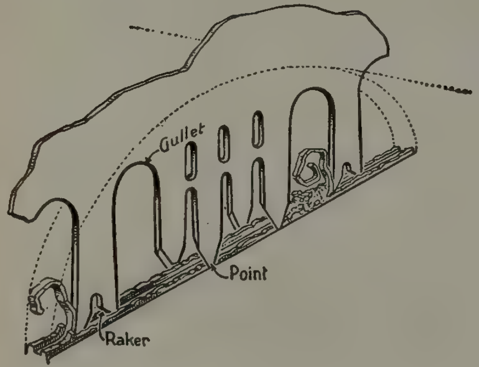


The Maple Leaf saw is higher priced than the ordinary saw because it costs more to make it. It is made of the very highest quality of steel and tempered by a secret process which toughens and refines the steel. The Maple Leaf trade mark on the saw means that it is the equal, if not superior to any saw made. It also means that you are privileged to test it against any other make and if not found equal or superior in quality you can return it and have your money refunded.

The ambition of the manufacturers of the Maple Leaf Saws has always been to produce the best tempered saw in the world and they are constantly investigating and experimenting with this end in view. They have recently made some valuable discoveries in evenness of temper. It has always been difficult to get a perfectly even temper on long and thin sheets of steel, such as saws are made of. Our recent discoveries make this an absolute certainty. Every user of saws should bear in mind that the temper of the saw is its most valuable quality. High finish and attractive appearance amount to nothing if the temper is not right.

All Maple Leaf Saws are Guaranteed to be Perfect in Temper

Shurly-Dietrich Co., Limited **Galt, Ontario**



Why Atkins Sterling Saws Run Free and Easy

Saws that depend on "set" for clearance have to tear their way through the timber, like the picture to the left. The teeth are sprawled out on either side and chatter and stick and bind and tear. That's why wood sawing is sometimes considered such hard work. That's why commonly ground saws can NOT run fast or pull easy.

ATKINS SEGMENT-GROUND CROSS-CUT SAW BLADES are ground thinnest on the center of the back. The teeth are the widest part, and the blade drops easily into the smooth cut which is made by the saw teeth. Very little set makes the teeth cut clean and the rakers clear the center. See the picture to the right. These Saws merely require enough power to pull them back and forth. That's why they run so easily.

ATKINS STERLING CROSS-CUT SAWS are the only Saws that are Segment-Ground, and for this reason are guaranteed to run easier and cut faster than any other Saws. Write us for free information, or order through your jobber or dealer. If they won't supply you, let us know.

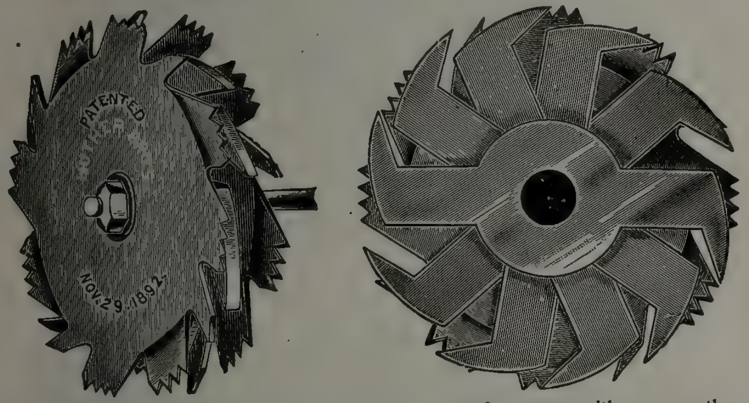
HUTHER BROS. PATENT GROOVER OR DADO HEAD
For cutting any width groove from one quarter inch to 2 inches or over



Can be used on any Circular Saw Material. Will cut a perfect groove with or across the grain. This is the only Dado Head on the market that gives entire satisfaction on all classes of work. No screw adjustment. For different width grooves, simply remove or add inside cutters. Sold by builders and dealers of wood working machinery in all parts of the United States. Will send on approval, in competition with any other make on the market; if not the best return at our expense.
HUTHER BROS., SAW MFG. CO., Inc., 1170 University Ave., ROCHESTER, N.Y., manufacturers Circular Saws, Morgan Pattern Lock-Corner Box Cutters, Concave Saws, etc.

"COVEL"

SAW FILING TOOLS

¶We are the only authorized Canadian manufacturers of Covel Saw Filing Equipment. ¶We underline "authorized" because it has an emphatic meaning. here are others selling what they represent to be Covel Filing machinery. So it is. But it is years out of date. ¶It has been superseded by newer designs that have been evolved and placed on the market because they are better than the old. ¶Being the authorized builders of these tools, we are in direct and constant touch with the designers. Every model they turn out and every improvement added is embodied in the machines we sell you—the latest and best in the Filing Tool line. *Send for our Filing Tool booklet.*

AUTOMATIC BANDSAW SHARPENER NO. 150

The No. 150 Automatic Bandsaw Sharpener illustrated herewith will take a saw with a blade up to 20-in. wide, and with slight variation is built as Nos. 140, 130 and 120, to take saws with 16-in., 14-in. and 10-in. blades respectively.

Frame

The machine is entirely self contained. The frame is built most substantially to overcome all vibration, and is open to permit quick adjustment and easy overhauling of every part. Over-all dimensions 50-in. x 55-in., extreme height 65-in.

Sharpening Head

The sharpening head is adjustable to give a concave cut with a straight wheel, and will set through a 45 degree angle to accommodate the hook of saw teeth. A 12-in. emery wheel is used, has three speeds, and is driven direct from the countershaft. This is made possible by the automatic idler attachment—a new wrinkle—that keeps driving belt always in the same tension regardless of the position of the emery wheel, and holds the belt always in the centre of the pulleys no matter at what angle the head is set. The sliding gate is 1¼-in. thick, slides in "V" shaped gibs so that wear can be taken up by adjusting one gib only. The gate rod controlling the position of the gate in the head is operated by a handle at the front of the gate which permits adjustment without hiding the wheel from the operator, and does away with the necessity of lifting the saw over the screw on the head. A ratchet lever is provided which raises gate and stops motion of the same when cams are being changed or when feed is regulated. All sizes and shapes of teeth can be sharpened, from 1-in. to 4-in. space. Each machine has five cam forms, giving as many standard sized teeth. Each cam is adjustable on the holder to give a large assortment of different shaped teeth. The cam shaft has two speeds and is cone pulley driven from the side of the machine where the belt can be easily regulated or shifted.

Front Feed

The feed arm is pivotted in double, babbitted boxes at the extreme bottom of the frame, making the push on the saw almost in a straight line. As it feeds the saw ahead it also holds it down so that it cannot climb. An adjustable guide holds arm in exact line, and a pull spring attached to it ensures a smooth even movement. Our patented adjustable knife shaped feed finger is furnished. This finger is flat, of ⅛-in. x ⅝-in. high speed steel, has lost motion take-up, and when worn can be readily removed. A replaceable hard tempered steel slide is provided, as is also an adjustable feed finger stop by which over-feed is avoided.

Back Feed

The back feed is simple, positive, and strong. The 1¾-in. shaft put through the bottom frame, carries rocker arm which works against back feed cam. This is round and adjustable from the centre to give more or less throw of back feed finger. The latter can be turned up out of the way and will not interfere when saws are being changed.

Saw Rest

The front bar on which saw slides is 5 ft. long, is furnished with square hardened steel saw rest adjustable so that its four faces can be used. The saw is raised and lowered by crank and sprocket chain shown in cut, making it unnecessary to stoop under saw.

General Construction

All connecting rods are forked, have double bearings to give even and uniform wear on all bolts and bearings. All wearing surfaces are planed and scraped; all boxes are large, are babbitted and scraped, and oil reservoirs are furnished at each bearing.

440 Square Miles Timber Limits

on Georgian Bay

to be Sold by Private Sale in Large or Small Blocks.

On account of their President and Principal shareholders being engaged in other large enterprises, and not having the time to give to them all, THE PARRY SOUND LUMBER COMPANY, Limited, offer fo Sale all of the timber lands, mills and town property situated in the Town of Parry Sound; also Tug Scow and full Camp Equipment for five camps, including boom chains, snow plows, sleighs, etc.

THE LIMITS TO BE SOLD

comprise some 440 square miles of licensed and deeded Pine, Hemlock, Spruce, Birch and other timber. The licenses from the Ontario Government include all timbers and are not restricted for time. Government dues are as follows: Saw Logs, White Pine, $1.50 per M. ft., B.M. Saw Logs, Hemlock, Tamarac and other woods 75c. per M. ft. The timber is situated in the Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street. The Canadian Pacific, Canadian Northern and Grand Trunk Railways run through the limits, which makes some of the parcels offered for sale particularly desirable for small mill owners.

A circular giving full information, maps, terms and conditions of sale will be furnished upon application to

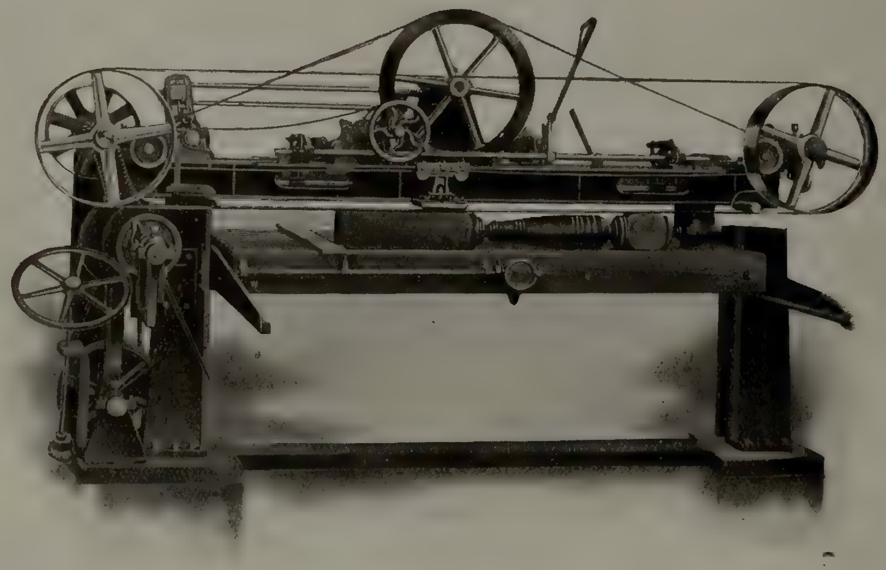
TWO SANDERS

that should be in every woodworking establishment



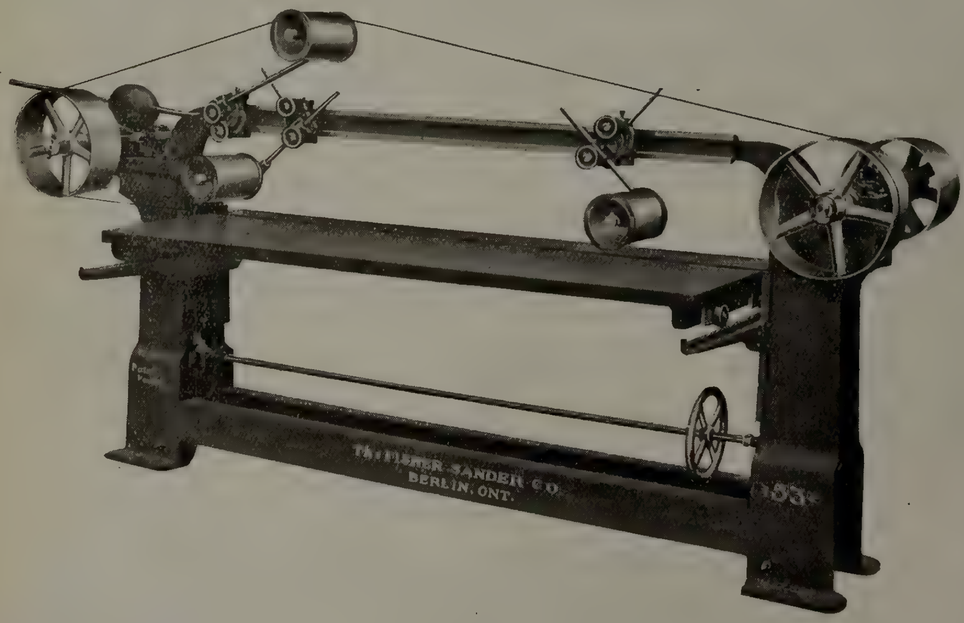
FISHER AUTOMATIC VARIABLE SPEED BELT SANDER

This machine will take your stock, either veneered or solid material, direct from the press, and finish "without any hand work" ready for the varnish room.

With the FISHER SANDER it is impossible to blister or burn your stock while sanding.

The operator has complete control of all adjustments while the machine is in operation.

This Sander is designed for the use of woodworking factories of all kinds, and will be found a most valuable assistance to any such business. The machine is strongly built with the weight were it is needed. All gears are cut from the solid.



FISHER NO. 2
VARIETY BELT SANDER

This Sander is specially designed for the sanding of all kinds of mouldings, piano falls, opera chairs, seats and backs, and all irregular shapes.

This machine is self-contained, giving a solid bearing on any kind of floor. An eight inch belt is used and can be adjusted by means of idle pulleys to suit any irregular shape, and can be converted in two minutes into a plain sander for flat surfaces of any width.

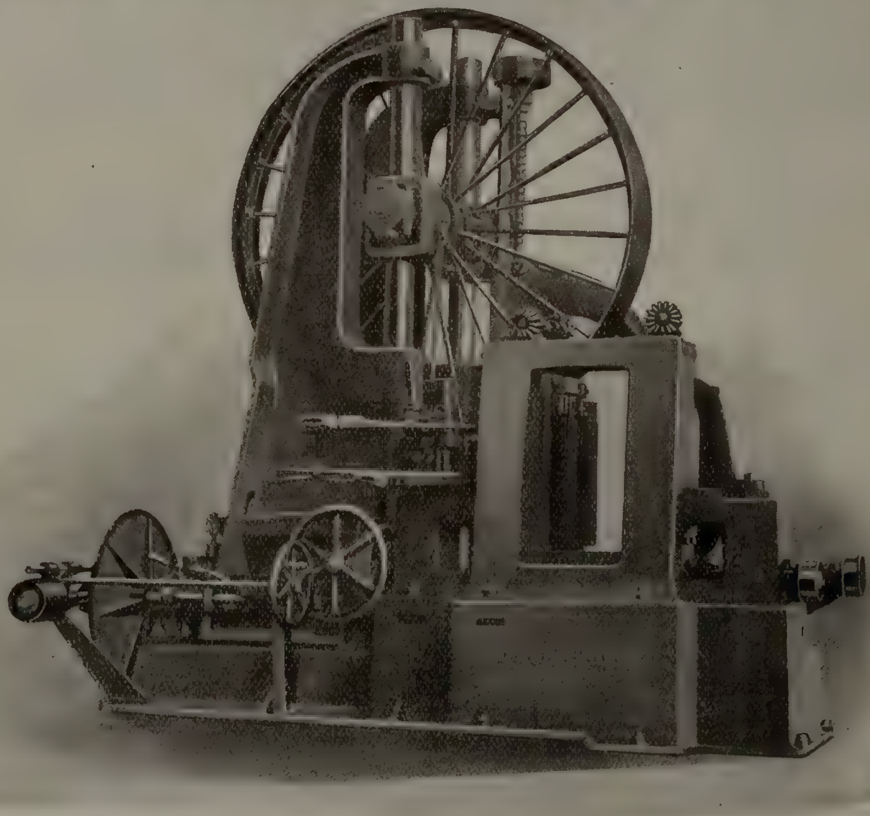
It is a mistake to

Install a Light Band Resaw



A 7 Foot Clark Band Resaw

Just as many men are required to operate a 60″ or 66″ resaw using 6″ or 8″ saws as are required to operate a 7′ resaw using 12″ saws.

The band resaw illustrated herewith is capable of a continuous daily output of from fifty to sixty thousand feet of 1″ and 2″ lumber, every piece of which is perfectly manufactured. This band resaw in connection with transfers and return rolls will raise the output of a single band mill from twenty-five to fifty thousand feet daily and will increase the daily cut of a double band mill from fifty to sixty thousand feet, depending upon the size cants or timber passed through it. It is a powerful and extremely rigid machine and weighs 28,000 pounds.

We build the heaviest and most complete line of saw mill machinery in the world. Better ask for catalogs.

Grand Rapids Veneer Works,
Grand Rapids, Mich.

Gentlemen :—

In reply to yours of the 2nd inst. would say that your Dry Kiln System has been very satisfactory to us. We have had no difficulty in drying perfectly any kind of material we use except rims. It will dry the material all right but the steam straightens them out. It is the only system in our experience that will dry gum box boards without warping. When we put in additional kilns it certainly will be your system.

Yours truly,
THE BAIN WAGON CO. LIMITED

WE have been making Knives seventy-eight years, long enough for us to be sufficiently sure of the Knives we make, to give an unqualified guarantee of satisfaction with them.

The steel used in Simonds Canada Saw Co., Limited, Knives is our special crucible steel, made in the Simonds Steel Mill especially for Simonds Saws and Knives.

Thus you will see we start right, and thereafter the steel is handled most skillfully until the finished knife is produced.

Whether you want Planer, Veneer, Stave, Shingle, Moulder or any other woodworking machinery knives, you may go as far as you like, try as many makes as you like, you cannot improve on Simonds Knives. Of course, different conditions require different knives, a difference in the temper most likely. Given an idea of the kind of woods to be cut, the machine on which the knives are to be used, and the dimension, we guarantee to give you Simonds Knives that will be perfect in balance and temper, exactly right to do the greatest amount of smooth cutting with the least amount of wear and care.

When you buy Knives, always buy Simonds

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Vol. 31 Toronto, May 15, 1911 No. 10

Lumber Prices and the Cost of Living

The cost of living, which has increased so enormously in recent years, and has become one of the most fruitful sources of discussion in the long list of questions of the day, is frequently treated in connection with the increased cost of lumber. It is safe to say that the average citizen, and, in fact, the vast majority of citizens, knew absolutely nothing as to the cause of this increase. Economic students and government bureaus are alone able to fathom the situation in any measure approaching to completeness. What the public reads in books and magazines has been so colored, according as it was written by the exponents of one theory or another, that for practical purposes it has had no value to the layman. There is one feature of the case, however, upon which the public can come to some sort of a definite conclusion, and that is the actual record of prices for a period of years, and their particular significance.

Taking such an important article as lumber, which has a great deal to do with the actual cost of living, it is interesting to study the figures which are given in a recent publication, issued by the Canadian Government, under the title of "Wholesale Prices in Canada, 1890 to 1909 inclusive." The Department of Lobor, which was in charge of the preparation of this work, had access to the records of many lumber companies, and to the files of lumber journals which have recorded the prices of the leading lines of lumber throughout this period. The first table, which is presented in this report, in connection with lumber, gives the average price per thousand of pine lumber, all grades, as obtained by large lumber companies in the Ottawa Valley. The average price in 1890 was $12, and remained at about this figure until 1898. In 1899 it commenced to advance, and in 1900 had reached $16.50. In another five years the price had reached $17.50, and by 1909 it had advanced to $20.50.

The price of good pine sidings, 1 by 7, and up, is tabulated in minute detail for the 20 years. Starting at $35 to $40 in 1890, it fell off gradually until 1898, when it sold at from $29 to $36. In 1899 a gradual advance commenced, and by the end of 1909, the price had reached $42 to $46. The advance during these years was, therefore, about $6 per thousand feet. Dealing with other grades and varieties of lumber, the following fluctuations are shown: Pine, No. 1 cuts and better, 1- inch commenced at $30 in 1890, advanced to $34.50 in 1893, fell off to $33 in 1897, continued at this figure until 1901, and advanced gradually to $50 in 1906, after which it decreased to $43.50 in 1909. Pine shipping cull sidings sold at $15 in 1890, fell off to $10.70 by 1898, advanced gradually to $26.50 in 1908, and declined to $25 in 1909. Pine box boards sold at about $13.50 in 1890, and fell off to $9.50 in 1898, then advanced to $21.25 in 1908. A decline then took place and the price in 1909 was $17.50.

Pine shingles, clear butt, 18-inch, at Ottawa, were selling at $1.67 per thousand in 1900, and gradually increased until 1909, when the price was $3.03. Cedar shingles, "Extras," on the wharf at St. John, N.B., were sold in 1890 at an average price of $2.70, and declined until 1897, when the average was $1.87. An advance then commenced, which continued until 1908, when the price was $3.25. During 1909 the prices fell to $2.93.

In hardwoods, the Toronto prices are given. Birch, common and better, 1-inch, commenced in 1893 on an average of $18, advanced gradually until 1895, when the price was $23.50, then declined until 1902, when the average price was $19. An improvement then began, and in 1906 the average was $24.66. A slight decline then took place, and in 1909 the average price was $24.20. Soft maple, common and better, 1-inch, sold at an average price of $16 in 1890, at Toronto. With slight fluctuations the price advanced steadily until 1904, when it stood at $22.83. A slight decrease followed, and the average price in 1909 was $21.10. Plain red oak, 1sts and 2nds, 1-inch, at Toronto, sold in 1890 at an average price of $24. This advanced until 1894, when $29 was reached. The price then remained fairly steady until 1900, when an upward tendency set in, and by 1908 the price had reached $50.16. In 1909 it remained at about this figure.

No. one white pine lath, 1⅜-inch, sold in 1890, at Ottawa, at an average of $1.85 per thousand. They fell off slightly until 1899, when the average price was $1.24 and then gradually advanced until 1907, when they sold at $4.25. In 1909 the price again declined and $3.40 was reached.

Causes of Price Increase.—All these prices show a gradual increase, in keeping with the advanced cost of manufacturing, caused by increased wages, increased stumpage cost and the necessity to go further away from the markets to secure supplies of growing timber. The fluctuations have also coincided closely with the economic fluctuations which have taken place during these years in the general trade conditions of the country. During periods of depression lumber prices have declined and during periods of industrial activity prices have gradually advanced. The figures go very forcibly to prove that the prices of lumber are dictated almost entirely by economic conditions in general, and that the lumber manufacturer, the wholesaler, and the retailer are to be considered properly, only as agents in the conversion of growing timber into merchantable lumber, and its transportation to the consumer. Their influence in the maintenance or increase of prices is practically nil. They are governed by the conditions prevailing in the industrial world in general. The only influence they can legitimately be considered as having upon the price, is the influence which they may exercise in an indirect manner, as being one factor in the general economic conditions. It would be as impossible for the lumberman to inflate prices for any length of time, as it would be for him to alter the planets in their course.

The Lumberman's Position.—These figures are an impartial record, secured by the government, and they should give a quietus to the occasional criticism of the lumberman on the ground that he is making undue profits, and that he is converting the forest resources of the country into lumber more rapidly than the circumstances require. The lumberman will continue for all time to convert the forests into lumber so long as there is a demand for it, and so long as prices warrant it. The people themselves are responsible if the forests are destroyed and it is the duty of governments to watch this phase of the question. There is no question that the timber resources of the country must be protected in the future much more than they have in the past, and it is equally certain that lumbermen will always be ready and anxious to assist in the work, because their own interests are involved more directly than those of anyone else.

As to the effect of the increased cost of lumber upon the high cost of living, the problem is more properly considered in its reverse light, viz., the effect of the high cost of living upon the cost of lumber. The cost of living is one of the most important factors in the cost of lumber. The wages of lumbermen in the woods and mills, the salaries of wholesalers and the profits of retailers are governed by what it costs them to live. Of late years the tendency in all branches of the industry has been to increase the share of the workingman in the distribution of wealth, and probably this fact has more to do with the increased cost of living than any other single factor. In former days the workingman did not receive what could properly be considered a living wage, and in those days prices of every commodity were low. To-day the workingman is, comparatively speaking, well off, and it is reasonable that the cost of living should have advanced in proportion. It is equally reasonable that the cost of producing lumber should have increased. The wonder is that with the rapid cutting out of the more easily accessible timber, prices have not soared to much higher levels, than those which have been reached. Fortunately, for the consumer, this has been prevented by the periodical fluctuations of industrial conditions, which, whenever prices have shown a tendency towards inflation, have invariably applied the brake.

Lumber Production in the Lake States in 1909

An interesting report has recently been issued by the Forest Service and the Census Bureau of the United States, relating to the lumber cut of the year 1909. The report embraces returns from 48,112 sawmills, which were in active operation, and it states that there were also 3,000 idle mills. In former years the number of mills in active operation was as follows: 1908, 31,231; 1907, 28,850; 1906, 22,398; 1904, 19,127; 1899, 31,833. The total lumber production for 1909 is shown to have been 44,509,761,000 feet of lumber, 3,703,195,000 lath, and 14,907,371,000 shingles, having a total value of $724,705,760. The next greatest quantity of lumber reported was that for 1907, 40,256,154,000 feet. In 1907, however, the present report points out, only 28,850 mills reported. It is practically certain, therefore, the report says, that had the canvass of 1907 been as thorough as that upon which the present report is based, the production for 1907 would have been much in excess of that of 1909.

The figures for the three lake states, Michigan, Minnesota and Wisconsin, are of direct interest to Canadian lumbermen. Of the individual woods, northern pine still constitutes the chief output of the three states, the total for 1909 being 2,179,268,000 feet, of which Minnesota, with 1,308,861,000 feet, manufactured considerably more than half. Michigan, once the greatest producer of this wood, manufactured but 258,080,000 feet. Michigan has more than made up for this, however, in her production of hardwoods, the output of maple alone being more than half a billion feet. Wisconsin led in the production of hemlock lumber, having produced 709,347,000 feet, to which should probably be added the 15,552,000 feet credited to Minnesota, as no hemlock is manufactured in this state. Both Michigan and Wisconsin produced more hemlock than they did pine, and Michigan produced more hardwood lumber than her combined output of both hemlock and pine. Wisconsin led all the states in the production of hemlock, birch, basswood and elm lumber; Michigan ranked first in maple and beech, while Minnesota stood at the top in the production of pine, tamarack, spruce and cottonwood. The production of birch was one of the leading industries of Wisconsin, coming next after hemlock and pine, with a total of 179,692,000 feet. This is one of the most serviceable of woods, and Wisconsin is far in the lead of all other states in its production. Basswood is another prime asset of Wisconsin, the product in 1909 being 133,887,000 feet. The production of sycamore was peculiar to Michigan, and Minesota enjoys the questionable distinction of producing the largest amount of balm-o'-Gilead. Not enough of this latter was produced, however, to give it a standing by itself, and it was included with the cottonwood, another wood of comparatively low value. The Wisconsin output of oak lumber was more than equal to the combined output of the other two states.

The most valuable lumber produced in the three states is walnut, the average mill price being $32.72. Wisconsin manufacturers seem to have placed a rather low value on this wood, for in that state its mill value is given as $26.62, whereas, Michigan valued it at $36.55, and Minnestota, at $35. Cherry ranks next in value, at an average mill price in the three states of $27.68. Conditions in the maple trade during the year appear to have resulted in a peculiar situation as regards values in the three states. The Minesota mill men valued their maple lumber at almost fifty per cent. more than the average for the other two—perhaps because there is very little maple produced in this state.

The values placed on their output by the Government report rather gives the Minnesota manufacturers the best of the situation. The average value per thousand for Minnesota soft woods is $16.65, which is higher than for either of the other two states, and the average price for Minnesota hardwoods, $17.04, is higher than for Michigan, though lower than for Wisconsin. The average value, $16.92, for all woods, is higher for Minnesota than for either of the other two states.

The Wholesale Lumberman's Duty to His Customers

Wholesale lumber dealers in Ontario, and, in fact, in practically every province of Canada, as a rule treat their retail customers in a businesslike manner and give them good service, but there are among the men on the road to-day a number who, in their anxiety to secure order, and who does not talk about other people's business. The man attention as they should to the principles of square dealing. The most successful wholesaler (the one whom the retailer likes to see oftenest) is the man who always sends them, without delay, the goods they order, and who does not tal kabout other people's business. The man they do not welcome is the one who takes an order for any kind of lumber, whether he can fill it or not. Retailers do not allow themselves to be bitten twice by such a man, but there are so many of them on the road to-day that it is possible to be made the victim by this sort of business several times in the course of a season. He retailer wants a particular class of stock. He has an order for it from a customer and can sell it profitably if he gets it in time. A wholesale traveller calls upon him and he explains his wants. "All right," says the wholesaler, and he goes on his way with the order booker. Another wholesaler who could fill the order quickly, happens along. He is told that the order has already been placed. A week or two passes and the stock does not arrive. The retailer becomes anxious, fearing that he will not be able to sell the lumber, unless it arrives soon. He writes to the wholesaler and is told in reply that the firm is unfortunately out of that class of stock, but that it will have some on hand shortly and will then fill the bill. Being unable to wait any longer the retailer at last places the order where it should have gone in the first place. He has lost much valuable time. He may lose the sale altogether, and thus not only lose his profit, but be burdened with the extra trouble of having to dispose of the stock, possibly at a loss, because there is little demand for it.

The retailer is entitled to better treatment than this. He should be able to depend upon receiving without delay whatever he orders from the wholesaler. As a matter of fact, in a great many cases he is never certain about stocks ordered, until they have been received and found O. K. Everyone in the trade can cite instances of this trouble. Here are a few of them from actual recent experience:

A traveller representing a manufacturer recently took an order for posts. At this time of year dealers can sell posts only on quick delivery. If they do not receive them in time, the posts must be carried over until fall. In this particular case the price and size of the posts seemed very reasonable to the retailer. The order, however, was not filled, and he lost a number of sales because of none-delivery.

In another case a traveller took an order for part of a carload of 1 x 5 clear strips. When the car reached the retailer, he found that this part of it was of a very inferior grade of lumber worth only about $35 a thousand instead of about $51. The retailer was caused a great deal of annoyance because he not only was unable to fill orders which he had received, but was obliged to force the inferior stock on an unwilling market.

Another retailer ordered a car of 2 x 10 and 12, and paid a price for which he should have secured these widths. When the car arrived it was a straight car of 2 x 10 without a single piece of 2 x 12 in it.

A carload of 2-inch No. 2 hemlock was ordered by another retailer and the wholesaler guaranteed him that it would contain 40 per cent. of 16-foot lengths. When the car arrived the retailer found that it did not contain more than 5 per cent. of 16-foot.

These cases are only a few from the experience of retailers in Ontario during the past few weeks. The least that can be said about wholesalers who practice such tricks upon their customers, is that they are dishonest. They bank upon the fact that the retailer will have to accept the lumber when it arrives, and they take advantage of this to try to dispose of stock which was not ordered. In too many cases retailers have been in the habit of putting up with this sort of thing quietly. They have found that they lose money by continually complaining. Their only remedy seems to be to ascertain by experience what firms they can depend upon and to deal with them exclusively. Unfortunately there soon comes a day when they need a certain class of stock urgently and at the same time an unscrupulous wholesaler happens along who works the same old game on them once again.

While on the subject of the retailers' complaints about the treatment they receive from wholesalers, it is fitting to say something about the practice of wholesalers selling to contractors. A wholesaler will call upon a retailer and be unable to secure an order. If he is one of those men who do not look closely into the ethics of their behavior, he hurries off to any contractor in the district and tries to sell him stock, even at a sacrifice. Contractors are willing enough to get their stock at wholesale prices, and the wholesaler makes a sale and goes away feeling that he has taught the retailer a lesson. This sort of thing is not only unfair to the retailer; it is a disgrace to the trade. The retailer is not a mere convenience for the wholesaler, to be ignored whenever it happens to suit him. He is an important channel of trade. He camps on the spot, studies the demand and keeps the wholesaler in touch with that demand throughout the year. For this service he is entitled to generous treatment. If he knows that the demand is not sufficient to warrant him in giving the wholesaler an order, he should be given credit for understanding the situation. The wholesaler who treats him properly will some day land his order. The man who seeks out the contractor, cuts his own throat. If the retailer knows his business he will never again give that man an order. So prevalent has this trouble become of late that a number of retail dealers have taken the stand that they will not buy in the future from any wholesaler or manufacturer who they find selling to the contracting trade in any manner.

The reverse side of the picture also has its disagreeable features. One of the worst of these is the habit some retailers have of playing off on wholesaler against another. The retailer should consider his transactions with the wholesaler as sacred. He has no right to mention to one wholesaler that another has been selling him stock at a price below that which is being offered. It would be fairer and at the same time much better for themselves and for the whole trade if retailers would remain silent about their dealings with wholesalers. The retailer and the wholesaler alike should transact business with one another on terms of the strictest confidence. As soon as one of them commences to play the other off against his competitors, the latter will naturally feel that he is justified in trying to follow the same tactics. The result is disorganized trade, and much bad feeling. The maxim of the retailer and wholesaler should be to go after business only in legitimate ways, and, above all, to preserve as much secrecy about their customers' dealings as they would wish the customers to preserve about their own.

Editorial Short Lengths for Busy Readers

In the Canadian Senate, Senator Deveber recently moved the adoption of a report assigning the Health Committee, of which he is chairman, five hundred dollars to enable investigation to be made of causes of typhoid in lumber and railroad construction camps. The committee two years ago did a useful work investigating the pollution of streams. There were many deaths from typhoid in lumber and construction camps, and he thought there was a useful field of investigation. The motion was adopted.

That the United States Government will do everything in its power to discover a lumber trust is indicated by the fact that in spite of the discouraging results which it has had so far, it is still on the hunt through the records of all the lumber organizations of the country. The northwest lumber and shingle manufacturers are now occupying the attention of a representative of the Department of Justice, who is at present on the Pacific coast. So far he has spent his time investigating the mechanism of various lumber and shingle organizations. He has been going over the books, minutes and records of the Pacific Coast Shippers' Association, an organization whose membership is made up largely of shingle wholesalers, and he is carefully making detailed notes of what the association has done in the three years it has been in existence. The government's representative also plans to go through the records of various other lumber and timber organizations before completing his investigations. He has just completed an investigation of the Western Retail Lumber Dealers' Association, with headquarters at Spokane. This association is one of the largest in the United States and its membership embraces retailers in Montana, Idaho, Washington, Oregon, Utah and California.

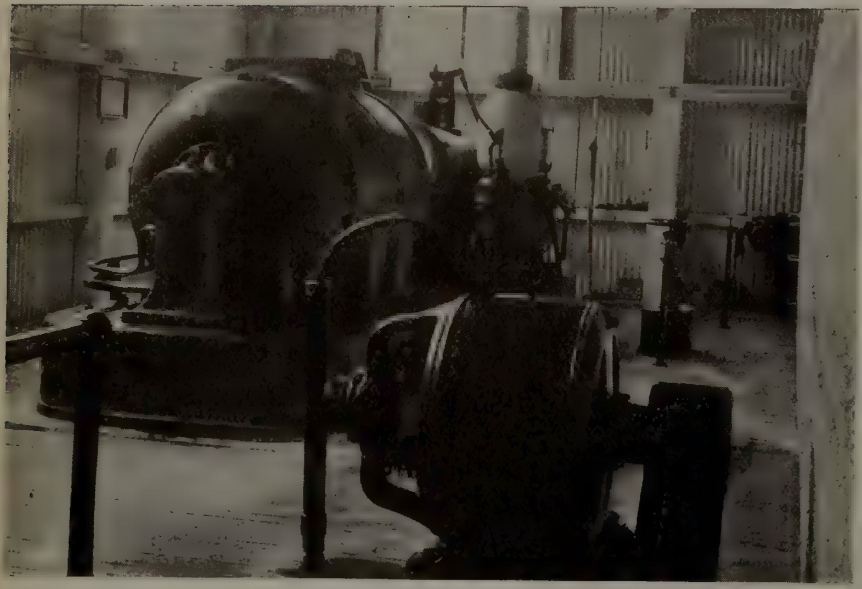
It is calculated that originally the timber bearing areas of Canada approximately numbered 1,900,000 square miles. Of this total it is computed that 98,000 square miles have been cleared for settlement and 100,000 square miles cut over by lumbermen, thus leaving a timber area yet untouched of 1,702,000 square miles. A considerable portion of this huge area has been permanently reserved to guard the watersheds of the river systems that water the great plains, and may therefore be regarded as outside of the pale of commerce. Some idea of th ravages caused by forest fires may be realized by an authoritative estimate that for every foot of lumber that has ever been cut by lumbermen in Canada at least seven feet must have been destroyed by fire. Since the first settlement of the country it is computed that the losses by fire in the forests of Canada must have amounted to 2,185 billion feet, which is 437 times as much as is cut yearly in the country. Fortunately, the natural reproduction is abundant, and measures which have been taken for proper protection against future fires will go far towards restoring the ravages caused by flames.

Canada's exports of lumber, timber, etc., for the month of February, 1911, amounted in value ot $1,300,642, and for the 11 months ending with February, the total was $42,726,349. The exports for the 11 months were made up as follows: logs, $1,033,056; lumber, $34,166,096; timber, $1,145,391; pulpwood, $5,693,058; miscellaneous, $34,166; In connection with these figures, it is interesting to note the destination of some of the more important classes of exports. The pine deal exports, which amounted to $1,468,801, for instance, were divided as follows: to Great Britain, $1,375,967; to the United States, $50,289; to other countries, $42,545. The spruce deal exports amounted to $6,557,123, which were divided as follows: to Great Britain, $6,137,769; to the United States, $218,676; to other countries, $200,678. The exports of planks and boards amounted in value to $20,329,480. This was divided as follows: to Great Britain, $1,538,779; to the United States, $15,143,289; to Australia, $294,286; to Argentina, $2,153,594; to Cuba, $314,348, and to other countries, $885,184. Exports of shingles amounted in value to $1,579,300, which was divided as follows: to Great Britain, $1,544,105; to United States, $30,796; to other countries, $4,399. Our pulpwood exports were entirely taken by the United States.

Notable New Saw Mill for Vancouver

J. Hanbury & Company's Plant Recently Completed—Entirely Driven by Electricity—Description of Buildings and Equipment

By C. E. Kendall



Turbo-Generator, at J. Hanbury & Co'y's New Vancouver Saw Mill.

Door Stickers with Direct Electric Drive, at J. Hanbury & Co'y's New Mill.

The recent completion of the sawmill and sash and door plant of J. Hanbury & Company at Vancouver, B.C., marks the inauguration of one more of those gigantic lumber manufacturing plants which are rapidly giving to the Province of British Columbia a foremost place in the lumber producing industry of the world. Mr. John Hanbury, the owner of the mill, already owns and operates large mills in the Kootenay district and at Brandon, Man. The most important feature of the mill is the fact that it is entirely driven by electricity. The site of the plant is an ideal one for the sale of lumber and stove wood at retail, and particular attention will be given to these branches. The mill is located at the south end of the Granville street bridge, on False Creek, thus being on tidewater and at the same time in the heart of the city. Probably two-thirds of the population of Vancouver is within a radius of a mile from the mill.

The sawmill was designed to cut short logs and handle them speedily, 32 feet being the extreme limit in length, with the intention of cutting fully 90 per cent. of the logs 20 feet and under. To make this possible, a heavy marine drag saw, motor driven, was installed on a float, in the log pond, where the logs are cut to suitable lengths. It is also the intention to cut only high class logs on account of the large amount of door stock required for the factory. The sawmill is a heavy frame building 38 feet by 244 feet, two storey, entirely enclosed with galvanized corrugated iron.

A Unique Log Hoisting Device.

On account of the large amount of space required for an ordinary logway, it was decided to install a vertical hoist at the side of the mill. An opening 12 feet x 36 feet was left in the side of the mill and the roof, heavily trussed, extended over this. A heavy shaft, with three drums, and heavy gears, direct to a pair of 10 feet x 12-inch Beck engines, was put in over the opening to par-buckel the logs up into the mill. One end of the 1-inch flexible steel cables is fastened in the log deck close to the log loader, the other ends are fastened to the drums. In operating the engines are run backward, lowering the loops of the cables into the water. The logs are then shoved into the loops, one, two, three or four logs at a time, according to size and shape. The engines are then run forward and the logs rolled up into the mill. In this mill the lift is about 40 feet at low tide. The logs are loaded on the carriage with a three-arm steam loader with extended arms to bridge the live rolls in the log deck. A 10-inch and 12-inch by 72-inch steam nigger handles all the small logs and an overhead chain canter looks after the large heavy logs. This canter is driven by a 10 h.p. motor-belted.

The carriage is a three block, 72-inch opening, heavy Pacific coast type, with Trout set works and a 12-inch x 42-foot shotgun feed. The set works are run by a motor below the floor, running an endless rope. The band mill is a 9-foot double cut, taking saws 15 inches wide and 52 feet long, and is driven by a 200 h.p. special slow starting motor, belted with a 20-inch double leather belt. The heavy band can be brought to full speed in one and one-half minutes. The main line of live rolls extend from the band mill to the tail end of mill and are divided into four sections. The first section, extending to the edger, is of extra heavy 12-inch x 36-inch rolls, with steam lift transfer to edger. The second section, extending to the slashers, is of

Two Door Stickers in Door Factory, with Motors Direct Connected.

High Speed Matcher with 50 h.p. Motor Direct Connected.

lighter rolls but the same size, 12-inch x 36-inch. The other two sections are 10-inch x 30-inch and 8-inch x 30-inch. The live roll drives are all below and are taken from countershafts with belts The edger is a Pacific Coast type, 8-inch x 72-inch, with steam lift rolls and is driven by a 100 h.p. motor direct connected to the saw arbor: The feed is driven independently from below, having two speeds forward and one reverse.

Behind the edger is a line of rolls in three sections extending to the tail end of mill, with transfers to the gang and resaw. The main line of live rolls also has transfers to gang and resaw. The slasher has 24 saws, spaced 12¼-inch centres, to cut all slabs and edgings into 12-inch stove wood, and is driven by a 50 h.p. motor direct connected to the saw arbor, with a flexible coupling. The chains are driven by friction and gears, belted from saw arbor. The wood falls from the slasher into a conveyor and is distributed automatically into 17 wood bins, each holding a good waggon load.

The gang is a 10-inch x 32-inch pony, Wickes Bros. make, and feeds towards the head end of the mill, the lumber falling onto the transfer to trimmers without any handling. The gang is used for cutting all the best grades of flooring, ceiling, etc. The resaw is a 6-foot pony Allis brand, with roller attachment, the rolls and pressure being operated by steam. This resaw is used for splitting door stock, panels, etc., and any 2-inch stock that may need to be split into 1-inch. A return set of rolls are installed and a transfer alone is needed to make it a return system. It was thought, however, that it could be kept going, splitting, and the return would not be needed. The feed is towards the head end of the mill and the lumber falls onto the transfer to the trimmers without handling. The lumber trimmers are the old style push trimmer on account of the lumber being cut short in the log. Lumber up to 24 feet long can be trimmed, but it works best for 20 feet and shorter.

Course of Lumber in the Mill.

After passing the trimmers, the lumber goes onto the first section, 50 feet long, of the sorting chains, where all the flooring, ceiling and door stock is taken off onto three wheeled Benson trucks. The remainder drops onto a set of chains controlled by the man feeding a 10-inch x 30-inch Stetson & Ross ready sizer. This planer will tawe, with two men feeding, any size lumber up to 12-inch wide S.I.S. I.E. from 1-inch to 10-inch thick or 1-inch shiplap up to 12-inch wide, changing instantly from shiplap to any size dimension, so that a piece of 8-inch x 12-inch can follow a piece of 1-inch x 6-inch shiplap. After the lumber has passed the planer, it falls onto transfer chains, and then onto a set of live rolls which convey it back on to the same line of sorting chains, which continue on for another 75 feet, the lumber being sorted onto trucks to be conveyed to retail yard or shipping platform. A 50 h.p. motor drives a 45-inch fan and the live rolls and transfers around the sizer. The sizer itself is driven by a 60 h.p. motor direct connected with flexible coupling.

The basement of the mill is high, 16-foot posts, giving plenty of room for the conveyors and drives. The system adopted was to group the drives as far as possible by belting from a motor to a short shaft and taking as many drives off it as could be conveniently reached, using frictions, wherever possible, to make the system flexible.

All the conveyors empty into the furnace feed conveyor, so that all the refuse goes through the boiler house. The basement contains the large 200 h.p. motor to drive the big band, a 100 h.p. motor to drive the resaw, three 40 h.p. and three 15 h.p. motors. Each motor has an oil starter and an automatic circuit breaker.

The power house is a frame building, iron clad, 44 feet x 60 feet, with an ell 30 x 26 feet. The boilers at present consist of three 72-inch x 18-foot return tubular boilers 145 pounds pressure, with foundation for another boiler of the same size. The boilers rest on concrete foundation, resting on a solid bed of piles, the piles being cut off 15 feet below where the brickwork starts.

The induced draft system has a fan 144-inch diameter, driven by an engine direct connected to shaft. Back of the boilers a solid crib wall 6 inches thick, separates the boiler house and the generating room. The generator set at present consists of a 500 k.w. turbo-generator of the Allis-Chalmers-Parsons make, a 27½ k.w. engine-driven exciter, and a 10 k.w. motor-driven exciter. The engine-driven exciter is also used to light the sawmill and buildings adjacent to it. A slate switchboard holds a complete set of instruments and a Tyrrell volt regulator. The system used is 3-phase, 60 cycle, alternating current, 440 volts. The generator being a 480 volt machine. Another 500 k.w. set will be installed so that ample power will be available for additions to the factory plant. Two main circuits lead from the switchboard, one to a distributing room in the basement of the mill and the other 600 feet to another distribution room in the planing mill. The cables are led to heavy copper bus bars and taken through fuses to the different motors. The wiring is all in conduit.

The filing room is situated in the roof of the mill, and is driven by a 7½ h.p. motor, a complete line of Covel machinery being installed.

The Planing Mill Equipment.

The planing mill building is a two-storey frame building 120 feet x 144 feet, roofed and sheathed with corrugated iron. The planing mill is in the upper storey on the same level as the sawing floor of the sawmill and the same height above the railway track as the car floor. The machinery consists of a No. 44 Berlin, driven by a 50 h.p. motor belted to countershaft, a No. 97X matcher with a 50h.p. motor direct connected to the countershaft, a No. 4 Berlin sizer 14-inch x 20-inch with a 60 h.p. motor direct connected to countershaft. A No. 108 moulder, Berlin make, with a 25 h.p. motor direct connected,; a 54-inch band resaw, with a 40 h.p. motor belted, and a heavy power feed rip saw, with a 15 h.p. motor belted. A 10 h.p. motor drives the filing room machinery and six trimmer saws behind the planers. There is room on the floor for four more planers.

The lumber is brought to the planers on three wheeled Benson trucks, and is loaded on the same kind of trucks behind the planers after being trimmed. Down stairs is the door factory with the following machines, each having its own motor to drive it, direct connected wherever possible: One 36-inch band saw; 2 panel raisers; 2 cutting up saws; 1 chain mortiser; 1 double emery grinder; 2 panel sanders; 1 door clamp; 1 2-head shaper; 2 door stickers; 1 rip saw; 2 double-end tenoner; 1 42-inch 3 drum sander; 1 48-inch 3 drum sander, all supplied by the American Woodworking Machinery Company. Besides these machines, there are several new machines, the invention of Mr. Mathieson, the factory superintendent. One of these is a 6 saw mortiser, which will make from one to six mortises at one operation. The present capacity of the factory is 50 doors per hour, and it is intended to increase it to 100 doors per hour. The posts are spaced 24-foot centres, so that they do not interfere with operations. For light, a continuous string of windows, 10½ feet high, run around three sides, so that there is 360 feet of unbroken glass.

Scenes at J. Hanbury & Company's New Saw Mill at Vancouver, B. C. 1. Arrangement of Piling Grounds; 2. Sorting Chain Buildings and Car-loading Platforms; 3. Platforms and Sorting Sheds; 4. Slab Slasher, with 50 h.p. Motor Direct Connected to Arbor; 5. Interior View from Band Mill to Tail-end of Mill; 6. 72-inch x 10-inch Edger, showing 100 h.p. Motor, Direct Connected.

A complete dust and shavings system is installed. A double 70-inch Sturtevant slow speed fan with the two wheels keyed to the ends of a 60 h.p. motor shaft, takes care of the planing mill, every saw and planer head being connected and sufficient sweeps being provided for the floors. The fan discharges into an Allingham dust separator on top of the roof. The dust from the separator drops down into the suction pipe of an 80-inch single Sturtevant fan with the wheel keyed to the shaft of a 60 h.p. motor. This fan takes the shavings from the separator above and also takes care of the different machines in the factory. The discharge is at present led to the piling yards for filling in, eventually it will be extended to the boiler house and burner.

An Otis-Fensom freight elevator, with a floor 6 feet x 20 feet, is placed alongside of the factory, and is used to take lumber and doors from the lower floor to the upper floor. Alongside of the planing mill and connected at both ends with a 26-foot passage way, is a 60 foot x 148-foot 2-storey building for storing lumber and doors. The upper floor being on the level of car floors. It is the intention to build other stock sheds alongside this one as they may be required, the front ends abutting onto the side track.

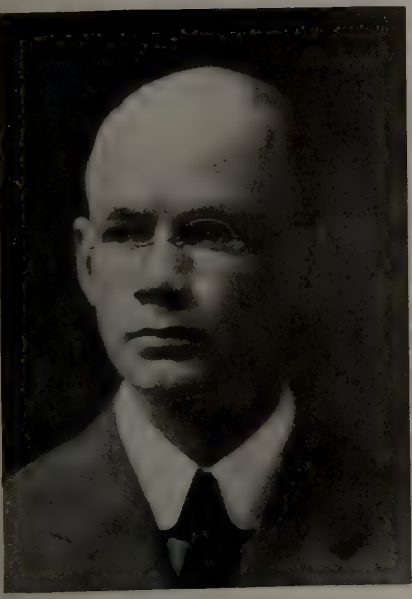
After investigating practically all the modern systems of drying lumber, it was decided to adopt the Lane & Jewitt system and to put in a four-room system. These four rooms are 10 feet 8 inches x 33 feet, inside measurements, and are built of brick and concrete, the roof of concrete and the walls of brick. No steam is required from the boilers in this system, the operation being on the same principle as a shavings exhaust. On the concrete floor of each kiln is a rectangle pipe 12-inch x 30-inch with openings in the side. This pipe extends through one end of the kilns and is connected to the main suction pipe of a single 90-inch fan placed in the ell of the boiler house. The discharge of this fan enters at once a dome shaped heater and is built up in the form of a helix. The fire is kept away from the pipe by a brick wall extending nearly to the top of the dome. The heat goes up to the top of the dome and then down around the thin sheet iron pipe coil, heating the air to about 300 degrees Fahr as it passes through the pipe. The hot air enters the kilns in another set of rectangular pipes lying on top of the suction pipe mentioned above. The hot gases escaping through a long slot in the top, circulate through the lumber and are again caught by the suction below, and carried to the fan and heater, carrying a percentage of moisture with them. The heavy moisture is taken care of by a shaft at the side of each kiln, in the form of steam. An ingenious arrangement extracts turpentine from the moist air while passing through this shaft. Each kiln is designed to dry two charges of 10,000 feet per 24 hours, making a daily capacity for the four of 80,000 feet of 1-inch lumber.

The size of these kilns is a great consideration, the total area for the four kilns being only 48 feet x 34 feet, where an ordinary set would cover about 80 feet x 120 feet. The kiln also makes it possible to saw a green log one day and ship finished doors from it the next day, doors that will not shrink or show gum pockets.

The general idea and arrangement of this splendid plant are to be accredited to Mr. John Hanbury, the detail plans and construction having been carried out by the writer. The Allis-Chalmers Company supplied practically all the sawmill machinery, and the Allis-Chalmers-Bullock Company all the motors, there being 45 motors, with a total horse power of 1,355½. The Waterous Engine Works Company supplied the boilers and induced draft system, also the filing room equipment. Mather & Yuill Company, electrical engineers, of Vancouver, B.C., attended to all the electrical installations. The Archer Blower Company, of Seattle and Vancouver, installed the complete shavings system. The Sumner Iron Works, of Everett, supplied the Benson trucks and the transmission for the Stetson & Ross sizer. Litson & Burpee, of Vancouver, the Vancouver Engineering Works, and Schaake Machine Works, of Westminster, built a lot of the special machinery.

Two thousand piles and 2,000,000 feet of lumber were used in constructing the plant, and the total cost was in the neighborhood of $225,000. A modern two-storey office building has been erected at the corner of Granville street and 4th avenue, the main office opening onto Granville street bridge. The furnishings were manufactured of oak, by the Hanbury Manufacturing Company of Brandon, Man.

Forest Engineering in Canada



C. A. Lyford, Montreal

Forest engineering is practically a new branch of technical enterprise in Canada. Needless to say it involves one of the most important lines of investigation and report yet established in this country. As pioneers in this field of research, Messrs. C. A. Lyford & Company have established offices in the Board of Trade Building, Montreal, following the establishment of headquarters for similar operations in Vancouver, B.C., under the name of Clark & Lyford.

Mr. C. A. Lyford was born at Waverly, near Binghampton, N.Y. Deciding to take up the profession of a civil engineer, he spent a year in practical work before going to college. In 1904 he graduated from the New York State College of Forestry at Cornell University as forest engineer, and in the same year he received the degree of Master of Forestry at the conclusion of a post-graduate course at Yale. The next three years were spent in the United States Forest Service. In 1907 Mr. Lyford became general manager of the Eastern Lumber Company, of Huttonsville, West Virginia. In 1908 he came to Canada and entered upon an engagement with the Riordon Paper Company, Limited, of Montreal, to make a survey of their limits on the Rouge river. In May, 1910, Mr. Lyford resigned his position with the Riordon Paper Company, after having surveyed approximately 1,175 square miles. He was, however, retained as consulting forest engineer.

At this juncture Mr. Lyford formed a partnership with Judson F. Clark, Ph.D., formerly Forester of Ontario, opening an office in Vancouver, B.C., under the firm name of Clark & Lyford, forest engineers. Mr. P. L. Lyford, a brother of C. A. Lyford, assumed charge of the Riordon survey. After five months spent in cruising British Columbia timber, Mr. C. A. Lyford returned to Montreal to sound eastern possibilities and as a result opened an office there. It will thus be seen that he has had eight years of practical experience chiefly in the pine and spruce forests of Canada and the northeastern states.

Mr. Lyford is a member of the Canadian Society of Forest Engineers, and of the Society of American Foresters. Evidence of his ability is to be found in a general forest survey and map of southern New Hampshire published in 1905 by the New Hampshire Forestry Commission, as well as in the detailed forest survey, including topographical maps for the Riordon Company. The area covered to date by the Riordon survey is 1,750 square miles.

Mr. Lyford is of a rugged type of manhood and a lover of the forest and of outdoor life. When a student at Cornell he was prominent in all forms of athletics, including football and rowing. He was "stroke" of the Cornell "Varsity" four-oared crew, which made a name for themselves in 1902.

Mr. Lyford reports that business is developing much faster than he expected when he opened his Montreal office. Inquiries are coming in from all over eastern Canada, including far-away Labrador, and the prospects are that the fall and winter work of the approaching season will be much more extensive than could have been expected a few months ago.

Driving Operations Commenced on the St. John

Fredericton, May 1.—The St. John River commenced falling in the last week of April and river drivers began to leave for the headwaters about April 30. The first bank logs to come down the river this season reached Springhill on April 27. They were owned by Mr. Robert Scott and sold to Randolph & Baker.

It is estimated that there will be about ten million feet of bank logs coming to Springhill, making a busier season than last year. The opening prices being paid by the lumber buyers there are $10 for battens and $13 for deal logs in spruce, while hemlock logs bring about $8.75 per thousand feet. It is believed that the prices of spruce logs will soon advance considerably as there is a lively demand. Lumbermen are much pleased with the prospects for stream driving on the Upper St. John. "I am not worrying about the logs coming out," declared a lumberman in charge of extensive operations on the upper St. John river. Encouraging reports have been received from up-river points. Old logs which had been hung up from last season in the upper river are running over the Grand Falls. They are logs which were below Grand Falls since last season.

Floating Birch Logs on Long Drive

Further Correspondence bears out Opinion of Previous Writers—Methods Adopted by some Prominent Operators

Several more letters have been received by the "Canada Lumberman" upon the question of floating birch logs. They bear out the opinions expressed in previous letters that floating birch logs on a river with rapids, is almost an impossibility. The additional letters received are as follows:

Editor "Canada Lumberman":—Our experience of floating hardwood logs is somewhat limited. We have tried soft elm and some hard maple. By having the timber felled during the bark-peeling season and rossing one side of the tree an axe-width and leaving the logs uncut until the fall, when they were skidded up, and in the winter landed on river bank and not rolled in until driving commenced, we found they floated up well. Our drives are usually short, lasting from a month to two months, and we arrange to saw the hardwood as fast as it can be sorted out. We have not found that this noticeably affects the quality of the lumber, although the rossed side of the log always floats up, and it might be thought would partially dry and get brittle. The loss in our short drives was about 2 to 3 per cent., and possibly some of these were not lost by sinking. We have no doubt that birch would be found to float quite as well as the maple and soft elm, although our experience with birch is not as extensive as with the others Yours truly, The Pearce Company, Marmora, Ont.

Editor "Canada Lumberman":—We have never known hardwood logs to be floated without a percentage of loss. Some operators peel their logs or strip them on two sides and allow them to stand until they are partially dried out. Others will bore the ends with a large sized bit for a distance and then plub the hole. This, of course, leaves an air space and makes them more or less buoyant, but hardwood logs after laying in the water for a while get very heavy, and a percentage are bound to sink. Maple, beech and birch, which are the principal native woods, will act about the same in this respect. Ash, elm, basswood and hemlock, which by some are classed with hardwood, will, of course, float. Yours very truly, The Seaman, Kent Company, Limited, Meaford, Ont.

Editor "Canada Lumberman":—We float a large quantity of hardwood principally maple, beech, basswood and soft elm, along the shores of the Georgian Bay with, we presume, an average loss of 10 per cent. This is what we have estimated our average loss to be through sinking logs and from other causes.

In reference to birch, this will float the same as other woods if left on the banks until it gets fairly well dried out, but we question whether you could float birch in a river, as it requires calm water, and the best weather is always picked out for floating or rafting hardwood logs. We have had no experience. however, in driving in a river, hardwood timber, and would not care to say what could be done in that respect. Yours very truly, Keenan Bros., Limited, Owen Sound, Ont.

Editor "Canada Lumberman":—In our opinion the only way that hardwood timber could be made to float would be to bore it with a 3-inch auger hole and plug the hole with a pine plug. It would require a hole bored out at each end and treated in this manner I think it would float. Of course, it wastes the timber some, but it will not float unless it is so treated. Very truly yours, Cleveland-Sarnia Saw Mills Company, Limited, Sarnia, Ont.

Question and Answer

F. W. J. asks the meaning of a "square" of shingles. Among the trade a "square" of shingles means sufficient shingles to cover a surface ten feet square, i.e., 100 square feet. In practice this works out at three bundles, or 750 shingles.

A Bay City, Mich., subscriber asks the meaning of the terms "c.i.f." and "standard." The term c.i.f., which is used in connection with the export trade, means "cost, insurance and freight." A quotation given by a Canadian exporter "c.i.f. Liverpool" would mean that the price quoted would be the cost to the importer in Liverpool, of the goods on board the vessel at Liverpool docks. The term "standard" is understood by the trade to mean the St. Petersburg sandard, which is equivalent to 1,980 superficial feet.

A Busy Season expected at B.C. Mills

Mr. G. McKay, Provincial Timber Inspector, reports that the coming season will be one of the busiest in the history of the lumber industry of the Pacific coast, and will also see one of the largest outputs ever made in one season in British Columbia. From advices received at the offices of the timber department, it is learned that preparations are being made by most of the lumber concerns operating on the west coast of Vancouver island and on the north coast of the mainland for a heavy season's work, many of them increasing the capacity of their plants to the extent of doubling their output.

On the west coast of Vancouver island the B. F. Graham Lumber Company, who possess extensive holdings at San Juan river, are putting in large booming grounds and making other additions in order to handle at least double the amount of lumber put through their mill last year. The James Deakin Lumber Company, who also possess extensive holdings on the San Juan river, are installing a large plant this year and preparing for a heavy season's work.

Mr. J. H. Hillis, of the provincial timber office staff, who returned recently from a trip to the San Juan river and Port Renfrew, reports that the preparations being made this year indicate that this will be by far the heaviest season on the west coast of Vancouver island.

Mr. Hugh McLean, the well known lumberman of Buffalo, who owns large plants in Quebec and New Brunswick, is on a visit to British Columbia and has been looking into the advisability of purchasing limits in that province.

Output of Tight and Slack Cooperage

Detailed Report Showing Quantities and Values During the Year 1909 —Information Secured from 128 Manufacturing Firms in Canada

(By H. R. MacMillan)

The information as to the amount of cooperage stock manufactured in Canada in 1909 is based upon reports received from 128 firms. The total value of the cooperage stock manufactured in Canada in 1909 was $1,842,235; the value of the tight cooperage stock amounted to $247,116, or 13.4 per cent. of the total; the remainder, $1,595,119, or 86.6 per cent. of the total, represents the value of the slack cooperage stock.

Tight Cooperage.

The tight coperage industry, the making of barrels for the containing of liquids, reaches but small proportions in Canada. The large users of tight cooperage, the shippers of whisky, beer, ale, wines and oils, import from the United States either their barrels, their staves and heading, or the logs from which to make this stock. The reason for this is that there are in the forests of Canada no oak, the only wood yet found to be suitable for the manufacture of the high grade tight cooperage required for the handling of these products for which in Canada are used the largest quantities of tight cooperage.

Table I., which shows the quantity and value of tight cooperage manufactured from different kinds of wood in 1909, represents only what was manufactured in Canada, and takes no account of the large quantities of barrels, kegs and staves, chiefly of white and red oak, which were during the year imported from the United States.

Table I.—Tight Cooperage, 1909—Total Quantity, Total Value, and Average Value, by Species and Classes, of the tight staves manufactured in Canada, 1909.

Table I

Kind of Wood.	Sawed.			Ale and Beer.			Bucked and Split.		
	Quantity — thousands	Value.	Average Value per 1,000	Quantity — thousands	Value.	Average Value per 1,000	Quantity — thousands	Value.	Average Value per 1,000

Total..	8,394	142,198	16·94	132	9,655	73·14	545	47,351	86·88

(1) From both imported and domestic logs.

The striking point in Table I. is that the tight cooperage manufactured in Canada is, both as regards the class of product and the species of wood used, not high grade. Only 1.5 per cent. of the tight staves manufactured in Canada are ale and beer stock, a class of goods requiring straight grained white oak free from knots. Such oak is not now to be had in Canada; consequently, the large quantity of ale and beer stock used in Canada is imported from the United States. Similarly, the other class of staves requiring a high grade of oak timber, the "bucked and split," constitutes only 6 per cent. of the total. The great bulk of tight staves manufactured in Canada are sawed; in 1909, out of a total of 9,071,000 tight staves, 8,394,000, or 92.5 per cent., were sawed. The relative quality of the different classes of staves is shown by a comparison of the average price per thousand; in 1909 sawed staves were $16.94, ale and beer staves were $73.14, and bucked and split staves were $86.88.

The great preponderance of the sawed tight staves and their low average price as compared with the other classes is explained by a study of the species used. It has already been explained that oak, and chiefly white oak, is the only timber suitable for the manufacture of ale and beer and bucked and split staves, that there is practically no oak in Canada, and that consequently these classes of staves are imported from the United States. On the other hand, Table I. shows that eight species of wood were in 1909 used in Canada for the manufacture of sawed tight staves. The two chief woods are elm and oak, which constitute respectively 63.5 per cent. and 19.4 per cent. of the total quantity of sawed staves; the other woods, with the percentage they represent, are: Spruce, 6.6 per cent.; Douglas fir, 4.2 per cent.; basswood, 2.6 per cent.; ash, 0.9 per cent.; and cedar, 0.8 per cent.

Though sawed oak barrels are used almost exclusively[1] for the handling of alcoholic liquors and oils, trades which require by far the greater part of the tight cooperage used in Canada, oak, including imported oak, stands second on the list of tight cooperage woods, and represents less than one-fifth of the total. Nearly four-fifths of the tight staves used in Canada are imported in a manufactured state; the remaining one-fifth, is manufactured in Canada from white and red oak, most of which is imported, part of which is picked up from farmers' wood lots, chiefly in southern Ontario.

The tight cooperage plants turning out high grade material are not situated in certain forest districts in Canada where raw material abounds, as is the case in the United States, but are managed by or closely allied to the large breweries, distilleries and refineries using their product. Varying with their convenience the breweries, distillries and refineries of Canada import their barrels or staves already manufactured or import the logs and manufacture them;[2] many of the tight cooperage plants in Canada using oak and supplying the high class trade are only assembling and repair shops; others are factories dependent upon foreign logs; a very few quite small manufacturers still manage to secure enough oak timber to supply them.

The tight cooperage manufacturing industry in Canada, not having any native supplies of a perfect tight cooperage wood at its disposal, is chiefly concerned with supplying barrels for the shipment of rougher commodities, such as fish, pork and other packing house products, syrup, molasses and glucose. For the handling of these materials, which are not so easily tainted as alcohols and which are not so penetrating as alcohols, or oils, tightly jointed barrels of elm, spruce, Douglas fir, basswood and ash are suitable.

Though these woods are used somewhat indiscriminately for the different uses to which low grade tight cooperage is put in Canada, there are special uses in which certain woods have come to be used to a greater extent than others. On the Atlantic coast large quantities of spruce, and on the Pacific coast large quantities of Douglas fir, are used in the manufacture of fish barrels and salmon tierces. Douglas fir is manufactured into tallow casks and exported to Australia. Elm contributes to all classes of cheap tight cooperage, but, with basswood, is used especially for syrup barrels. Ash goes chiefly to the packing house trade.

Breweries report the use of Douglas fir and cedar for vats and tanks. The high average price of the cedar staves manufactured, $83.33 per thousand, would indicate that they were for such tanks.

The quantity and value of the tight heading manufactured is given in Table II.

Table II.—Tight Cooperage, 1909—Total Quantity, Total Value and Average Value, by classes, of the Tight Heading manufactured in Canada, 1909.

Table II

Class.	Quantity. — (Sets)	Value.	Average Value — (per Set)
		$	c.
Sawed....................................	413,764	42,356	·10
Ale and beer (1)............................	11,250	5,556	·49
Total....................................	425,014	47,912	·11

(1) This heading is all White Oak, chiefly from imported logs.

Here it is shown that sawed heading predominates just as do sawed staves; 97.4 per cent. of the heading manufactured in Canada is sawed, 2.6 per cent, is ale and beer. Oak alone is used for the ale and beer heading, and the price, 49 cents per set, is consequently nearly five times as great as the sawed heading, for which elm, spruce, Douglas fir, basswood and ash are used.

The annual manufactures of tight cooperage in the United States are 38 times greater and 58 times more valuable than those of Canada. The United Statesh exports high grade tight cooperage. Canada imports it. The United States owes its control of the tight cooperage on this continent to its large hardwood forests; so superior in this respect is the position of the United States that while, even including imported logs, oak constitutes only 55.5 per cent. of Canada's small tight cooperage output, it furnishes 87.2 per cent. of the tight staves manufactured in the United States.

Slack Cooperage.

As there is a greater demand in Canada for slack cooperage than for tight cooperage, and as Canadian woods are better adapted for slack than tight cooperage, the manufacturing of slack cooperage stock is by far the greater part of the Canadian cooperage industry. There were manufactured in Canada during 1909, 103,982,000 slack staves, valued at $809.649; 8,310,000 sets of slack heading, valued at $432,343; and 35,771,000 hoops, valued at $353,127; a total of $1,595,119 for the slack cooperage industry.

---

[1] Some imported red gum is now used for barrels containing heavy oils.

[2] There were imported into Canada in 1909, 101,818 tight barrels, valued at $117,667, and 4,919,000 oak staves and heading, valued at $174,346—a total tight cooperage import worth $292,013.

Details are given in Table III. of the quantity and value of the different species of wood used for staves, heading and hoops.

Table III.

Kind of Wood.	Staves.			Heading.			Hoops.		
	Quantity — thousands	Value.	Average Value per 1,000	Quantity — thousands	Value.	Average Value per 1,000	Quantity — thousands	Value.	Average Value per 1,000
		$	$ c.		$	$ c.		$	$ c.
Elm	66,586	563,198	8 46	2,297	97,983	42 65	29,327	294,224	10 03

Balsam	200	1,160	5 80	....	....	....	....	....	....
Total	103,982	809,649	7 78	8,310	432,343	52 03	35,771	353,127	9 87

Ten species of wood were used in the manufacture of slack staves in 1909. Two species, elm and spruce, furnished over four-fifths of the total; 64 per cent. of the staves were elm and 16.5 per cent. were spruce. Poplar furnished 6.1 per cent. of the staves manufactured, and the other species used—maple, birch, beech, basswood, ash, cottonwood and balsam—furnished each less than 5 per cent. of the total.

Excluding cottonwood, of which a comparatively small quantity manufactured in British Columbia brought the high price of $15.83 per thousand, basswood and elm staves at $10.83 and $8.46 per thousand were the most valuable. Staves of other species varied in price from $7.28 to $5.80 per thousand, with spruce and balsam the cheapest at about $5.80. One reason for the low price of spruce is that it is the wood chiefly used for nail kegs and the roughest class of cooperage. The higher price of basswood and elm and poplar is due to the superior qualities of the cooperage manufactured from these woods and to their general use in the higher class of cooperage used for flour and sugar barrels.

The decrease in the quantity of basswood and the extension of the slack cooperage industry into districts where basswood is not to be found, but where poplar is abundant, has given poplar first place in the manufacture of heading. Poplar is good heading material and is destined to replace basswood for this purpose in Canada. It is now used largely for flour barrels. Nearly one-third of the heading manufactured in 1909 was poplar; poplar and elm together furnished over one-half; about one-fifth was basswood and one-fifth spruce. The percentage manufactured of each of the leading species used was: Poplar, 30.9 per cent.; elm, 27.7 pe cent.; basswood, 21.2 per cent.; spruce, 19.1 per cent.

Of the four species furnishing the bulk of the heading, spruce and elm bring the lowest prices at $30.68 and $42.65 per thousand sets, while basswood and poplar sell to the best advantage at $57.43 and $70 per thousand sets.

Though metal and wire hoops are being increasingly used with slack cooperage, wooden hoops are still turned out in a quantity proportionate to the staves and heading manufactured. Elm is the chief wood used for hoops in Canada; there were 29,327,000 elm hoops manufactured in 1909; this was 81.9 per cent. of the entire output; the other species used—basswood, birch and beech, maple and spruce—divided almost equally the remaining 18.1 per cent.

Hoops of all species, excepting spruce, sold for about $10 per thousand; spruce hoops averaged only $5.94 per thousand, the price being kept down by the poor quality of the material used for this purpose and by the use of spruce for nail kegs.

Three classes of manufacturers produce the slack cooperage of Canada. The smallest and most numerous are the individual coopers, chiefly located in the apple regions of Ontario, Quebec and Nova Scotia, who cater only to the local demand. Frequently these men carry on a cooperage business in connection with a small sawmill. Another class of slack cooperage manufacturers comprises the large shippers, chiefly of flour, who maintain private cooperage plants. The third class, manufacturing the greater part of the slack cooperage used in Canada, comprises the large cooperage factories. These factories are located with reference both to the supply of hardwood timber and to the market for barrels, and are nearly all situated in the hardwood regions of the eastern provinces, chiefly Ontario. Reports from these factories indicate that they are finding it increasingly difficult to find timber; that those which do not close down permanently are forced to move to new locations to secure raw material. As the farmers' wood lots become exhausted, the general trend of the slack cooperage industry is to move farther north, where large supplies of poplar, spruce, maple and birch may be found.

Most of the slack barrels used in Canada are of domestic manufacture. The chief imports are of hoops, together with small quantities of gum and sycamore for flour barrel staves.

Considered on a per capita basis, the annual slack cooperage output of Canada is greater and more valuable than that of the United States. Slack cooperage is, nevertheless, dearer in Canada than in the United States; the United States prices per thousand were for 1908: Staves, $5.72; heading, $45.71; hoops, $6.91. The prices in Canada during 1909 were: staves, $7.78; heading, $52.03; hoops, $9.87. Nineteen woods are used for staves in the United States; five of these—red gum, pine, elm, beech and maple—furnish each more staves annually than are cut in the whole of Canada. Though pine is the second most important slack cooperage wood in the United States, it was not reported for 1909 by any Canadian cooperage firm.

Slack cooperage can profitably be manufactured from sawmill waste, and it would be a great saving of timber if this practice became general. This method of utilizing all the timber and reducing the cost is finding favor in the United States. There are yet but few signs of it in Canada.

Shrinkage of Lumber in Seasoning

It has always been a question with the manufacturer, when sawing up his logs, as to just what thickness the boards should be sawed, that when thoroughly dry they will be of the required thickness. During the past two months we have endeavored to determine from actual tests, results of which were submitted to us, the percentage of shrinkage in the different woods, and we submit below the average percentage of each wood as reported to us:

Kind of Wood	—Periods of Seasoning— 2-months dry. Per cent.	4 months dry. Per cent.	6-months dry. Per cent.
Ash	3⅓	6	6
Basswood	3½	5	7
Beech	3	3½	7
Butternut	4	6	6½
Cherry	2½	4½	6½
Chestnut	6	6½	7½
Cottonwood	6	8½	10
Cypress	8	10	10
Elm	5	7	9
Gum	4	7½	9½
Hardwood, D.M.	3	4	5
Hickory	2⅔	4	5½
Maple	4	7½	8
White Oak plain	3½	5	6½
Red Oak, plain	4	6	8
White Oak quartered	2½	5	7
Red Oak, quartered	3½	6	7½
Poplar	4	6½	8½
Sycamore, plain	3	5	6
Sycamore, quartered	1½	4½	6½
Tupelo	4	4	6½
Walnut	3	5½	6

It should be very strongly impressed upon all manufacturers of hardwood that one of the best profit-makers in his organization is his sawyer, and that next to him should, perhaps, be placed the edger man and the trimmer. A sawyer may be able, by good judgment, in turning his log at the proper time, to get the greatest possible amount of high grade lumber out of it, but there is always something left to the edger man and to the trimmer and these should not be neglected.

In the visits of our inspectors to consuming points, they have been placed upon cars of lumber which had been absolutely refused by the purchaser, owing to their extremely ragged and rough appearance, and upon inspection it was found to be below the grade invoiced, owing entirely to bad ends and waney edges, which should have been trimmed and edged off. Our inspectors cannot manufacture the lumber with a board rule. Again, shippers of wagon box boards frequently receive reports of shortage in measurement and when it is known that such shortage has been obtained by the buyer measuring inside of such defects as wane, bad knot ends, it will be better to allow such shortage than to insist on remeasurement, as otherwise our inspectors, if placed upon the car, will be forced to measure each board full, and the defects mentioned will naturally lower the grade; the grade may thus be lowered in excess of the amount of shortage claimed.—Lewis Doster at annual meeting of Hardwood Manufacturers' Association.

Mr. Samuel Collyer, a well known investment broken of Seattle, Wash., recently visited Vancouver and Victoria in the interests of wealthy clients who are considering the purchase of limits.

The Retail Dealer and His Problems

Opportunity In The Retail Lumber Trade

The Retail Lumber Business of the Present

By W. C. Hickman*

The retail lumber business of the present time is one of the best vocations a man could follow. I can see no reason why any man, it matters not who he might be, should not feel proud to be called a lumberman, either retail or wholesale. It is a great industry carried on by upright, honorable men, who do things—men whose words stand for something—men the world can depend upon. I am proud of the fact that I am associated with this great industry, even though it be in a small way, and I only hope that I will always be as well pleased with its workings as I am to-day.

I know of no other line of work that offers better and more inducements to the young man than the retail lumber business, provided the young man has the proper amount of energy to stay with it. Most people, and especially young men, look upon our work as being below their calling, and most especially the retail end of the business; they seem to want to get into something easy where they can go dressed-up while at work, and they are very particular about keeping their hands soft and white; but you cannot handle lumber with soft hands and while wearing fine clothes.

Now, we might ask the question, What does it take to make a successful retail lumberman?

First—He must not and cannot be what we term lazy.

Second—He must not be what you would call a "grouch," but to the contrary he should always wear a smile—the kind of smile that won't come off. You know that one little smile, followed by more later on, has changed many of our lives and the good work is still going on—why, if it had not been for that first smile I would not to-day be the happy married man that I am—so smile!

Third—I believe, to be a successful retail lumberman, that you should familiarize yourself with the faces and names of your customers and when you meet them, it matters not where, give them the glad hand and make them feel that you are interested in their welfare more than to simply sell them a bill of lumber and get their money.

Fourth—For a man to be a successful retail lumberman, he must be a merchant—a merchant in the fullest sense. He must keep posted as to the market, and know the condition of his stock at all times. I wonder how many there are here to-day who have gone through their yards and found that they were out of the very kind of stock that was needed the most; and as you were making your way back to your office to look through your order files thinking all the time just what you were going to write to the poor old travelling man, or to the head knocker at the main office—and then what? You would find that you had overlooked ordering that particular stock, although the salesman had been drumming you hard for orders.

Speaking of travelling men, God bless every one of them! I do not think that a retail lumber dealer could have a better asset than the good will of the men who call on him, looking for orders. They always bring sunshine and pleasure and we should always greet them with open hands, even if they do make us pay for our lumber and other stocks at times, like they are doing now.

We, as retail lumber dealers, have our friends and enemies—our friends are the manufacturers and wholesalers and their travelling representatives that sell through the legitimate channels of trade—the retail dealers. These friends we should cherish, for they are near and dear to us—without them we could do nothing; we should cooperate with them as much as possible by ordering our stocks far enough ahead so as not to cause them unnecessary expense and trouble in filling our orders.

About Collections.

Now what about our collections? I believe that this is a part of our business that we all neglect more or less and it is the most important part of the whole. If it were not for getting into trouble with Met L. Saley, I would bet $4 and my old black muley cow that nearly every lumber dealer here to-day has, while making strenuous effort to get new business, neglected collecting for that already sold and due as well as past due.

I believe that we ought to pay more atention to collecting our outstanding accounts and be less eager to underbid our competitor on bills we feel that justly belong to him and would go to him if he can make even as good a price as we can make.

Now don't understand me as advocating the elimination of honest competition, for such is not the case. Business would lose all its fascination if there were no competition—but I do hope to see, and I believe we will all welcome the day, when we as retailers will have learned more and better sense than to indulge in what is known as cut-throat competition.

Now, what kind of a citizen does the retail lumber dealer make? It can tell you. He makes a good one. You cannot point out a man in your locality more loyal to his community and who is more ready and willing to contribute to any good cause, than the successful retail lumber dealer. He stands ever ready to lend a helping hand to any movement that is calculated to upbuild the community in which he lives. Go with him to his home, meet his family, and note while there how happiness in this home reigns supreme.

Yes, the retail lumber dealer makes and is a good and substantial citizen.

The retail lumber business of the present is just what we make it and if we will continue to pull together and work to one end, we will off when every legitimate dealer will be enrolled under our banner to battle with us in upholding one of the greatest mercantile industries upon the face of the globe to-day.

---

*Extract from an address to the Southern Retail Lumber Dealers' Association

Pertinent Points on Retail Yards

The successful modern retail lumber business is a science, and as such it should be studied and mastered. Its development is conditioned by the same sound business sense as is that of any bank or railroad, says F. J. H. in the West Coast Lumberman. The lumber merchant must enter the open market for his stock in trade, where supply and demand govern the price he must pay. He must sell on the same basis and under the same conditions. His business is as complicated and diverse as any in the mercantile world, and well may the aspirant for future greatness in the retail lumber world conclude to serve faithfully his apprenticeship under the best leaders of the land.

The modern yard should have a neat, well-lighted and well-ventilated office, such as you will find in an up-to-date bank or any up-to-date business. It should be fitted with suitable furniture, an easy chair wherein the tired customer may rest while you figure his bill. Writing table and material should be handy, that he may make out his own bill, if he chooses, or write out his check. There should be no place for the loafer and no inducement to make a smoking room of it should be given or allowed. The floor and the stove should be as free from tobacco spit as that of our parlors; in short, the office should be kept sufficiently neat and clean as would be agreeable to any lady.

We would have all our lumber under cover. This for economy as well as convenience and a trade getter. Any carpenter prefers dry lumber and will buy from the merchant who keeps it dry, and as one once said in the writer's hearing: "I buy my lumber from the merchants who keeps his lumber dry, if for not other reason than the one that prompts me to find shelter for all my stock." We presume he meant that it paid him to keep his stock sheltered. Tte style of the shed must be governed by the location and the taste of the owner.

The stock should be systematically arranged, neatly piled and studiously taken care of. No lumber should be put into the pile until it has been carefully inspected, both as to quality and quantity, and also as to condition of dryness. We have seen lumber rot in the pile, for which we can offer no apology. If it is not thoroughly dry it should be protected by extra sticking. If dry lumber is bought the wholesaler should bear the cost of extra sticking, but in any case the lumber should be properly protected and taken care of. The count should be verified and any overage should be as scrupulously reported the same as a shortage. If the proper credits for overage are reported we will find less trouble getting credits for shortage.

We would allow ourselves a good salary for our time, take into account all items of expense; allow only such risks as are absolutely unavoidable; exercise every precaution and sound business sense, then add the customary rate of interest and be content. If we want to speculate we should enter other fields.

We seem to be greatly exercised of late over a mail order competition, and are laying all manner of plans to put them out of business. But after a closer study of their methods, the field they labor in and the patronage they receive, we may learn a lesson that might enable us to avoid other evil consequences.

We believe the mail order house has come to stay. From their success we judge that they have the sympathy of long lists of our people. Fundamentally they are the natural result of our own exhorbitant rates of profit, and until we change our methods (which we scarcely expect this side of the millennium) they will continue to prosper. Their birth dates back to the time when the retail merchant in all lines was reaping an exhorbitant profit, and their business was established on no other than a sound business basis. They perceived that by buying for cash and selling for cash they could sell at a less profit than could the man that sold on credit. They also saw that if they would buy from the wholesaler and sell direct to the consumer they could make another saving, and by dividing their savings with the consumer they could expect his patronage. It was simple, and the only wonder is that not more took advantage of the opportunity.

Do not forget that the customer, as well as the merchant, has become enlightened. He knows the market price of lumber as well as the merchant. The time is past when the merchant can get exhorbitant prices undetected for his wares. And when detected he must pay the penalty. The customer realizes he is under obligation to his merchant and is willing to honor this obligation, but he also insists that the merchant is under some obligation to him, and we believe a recognition of these mutual obligations would smooth out several rough places in our business life. The trouble with us all, dealer and consumer, has been: We are too extravagant. We, as merchants, are too loose in our business methods, too extravagant in our habits, and yet we prosper. The consumer, noting this, sees our habits and evident losses, and sees that we prosper, and naturally figures it out that he is paying for it. Can we wonder that he turns away from us and buys where he can buy cheapest?

Recognizing the right to all the trade we can get, we should not forget the right of others. There are business ethics which prove a good investment. It does not pay to antagonize trade naturally belonging to other territory. It does not pay to have our rating in the Red Book as 33. It does not pay to cancel an order given and accepted in good faith simply because we learn that the goods could have been bought a little cheaper elsewhere. It does not pay to have the reputation of being tricky. It does pay to give value received for what we sell. It does pay to insist that our goods be up to the grade. It does pay to discount bills. It does pay to be wide awake and looking for opportunities to improve our business.

The Spring Clean Up

There is scarcely a more important time of year to the retail lumber dealer than the early spring. It is often then that the first definite plans for the new building season are talked of, and the new stock of lumber for the coming season is picked out and ordered, says a writer in The Lumber World. It is just at this time of year that every retail lumber dealer should go thoroughly through his stock and he has at this time an opportunity to convert much of his unsalable stock into cash.

It is very essential that the yard and sheds should have a very thorough cleaning. In the yard there are numerous odds and ends which have been laid out during the preceding season. There are countless small piles of off-grade stock, broken pieces of tree stuff and boards, and many odd pieces of uncalled for sizes and lengths. These should all be picked up, sorted over and put together in some conspicuous place where each prospective customer may be taken and shown. All the broken bundles of lath should be picked up and rebundled. The same applies to shingles. It requires but a small amount of time and converts worthless rubbish into a salable product.

If there is any very large accumulation of this odd stock—and in almost every yard there is more than the owner will believe—it should be put together and arranged in such a manner that its attractiveness may be easily shown. There is always a buyer ready to take it if it is shown to him in the proper light.

After the ward is well taken care of, it is equally important to carefully go into the shed.

How about the roof? Does it leak? Generally, yes. And now is the time to fix it before the spring rains set in and ruin a lot of stock for you. Here, as in the yard, get all of the odd stock together. Tie up the broken bundles of siding, flooring and ceiling. Pick out the off-grade stock and get it into a bin so that you can readily show it to your customers. Don't put it off in a corner where it will be hidden away, but put it in the front of the shed where the salesmen will see it every time they go into the shed and it will become such an eye sore to them that they will make an extra effort to sell it.

Fix broken window lights and wash the windows in the skylights. Have as much light as possible in your shed—it will make everything look better.

Take your odd windows and doors and sort them up as far as possible, putting the various sizes together, but put them in a conspicuous place and put a price on them that will move them, and when you have sold them, convert this new capital into stock which is standard and can be turned over and over.

This same feeling of "cleaning up" in the spring applies not only to the yard and shed, but also to your book accounts. You are not so very busy right now. Bills are not being figured in any great numbers, and it is an ideal time to go over your accounts; find out who have ben delinquent all winter, and go and see them personally; find out what they will do for you. Letters are all right, the telephone is better, but seeing them personally is the way to get the money. Clean up the old accounts. If there is any dispute, settle it, and get the money in the bank. This will help you discount your bills on the new stock which is coming in and will put you in a position to command a better price.

When your new stock comes in try as far as possible to pile it so you can sell the old stock first. It is a common mistake to keep piling new stock on old stock until the old stock rots or degrades so you have to take a serious loss on it.

The ideas which I express are known to you now, but I have saved a good deal of money and worry for myself by following these simple suggestions, and it is with this in mind that I suggest them to others.

Difference in Piling

Recently I was in a shed in which several bins were filled with maple flooring, says Met. L. Saley, in The American Lumberman. In a couple of the bins the ends of the flooring were piled evenly, and in the others the piling was about as rough as you would want to see. It was explained that the flooring that was decently piled was handled by the regular employees of the yard, and the other by draymen. Of the work of the draymen the dealer was ashamed and remarked how much more attractive the well piled stuff was to purchasers. On the surface a novice most assuredly would call it better flooring, and there was not a penny's worth of difference in the quality.

The lumbermen who have not got this idea in their heads are numerous enough to make several regiments. Goodness knows why they are staggering along in this way so long when they have had ample opportunity to learn to the contrary. "Do you see much poor piling?" was asked recently. Do I see much of it! I wish I could say I didn't, but if such a statement were made, little Dutchie's conscience would be as uneasy tonight as his stomach would be if he had eaten gravel for supper. Some dealers have not the time to pile their lumber properly—so they say. Others whose piles look as if they had been shaken up by an earthquake appear to be unconscious of the fact. I was in a large shed in which there was miserable piling, and this unprofitable way of storing material was not referred to by the proprietor, who showed me around the premises. I should have liked to touch him up a little on it, but what is the use? He has seen fifty years, has sold lumber half of that time, and for him to try to learn a new trick at this stage of the game would be asking too much. This dealer says he means to retire from business in a year or two, and maybe when a new man takes the helm the piles will be put in shape that will add to their appearance 50 per cent.

When this dealer talks about retiring one may know that he has made money in the business. So he has. He could live without shoving boards. He is rated at from $25,000 to $35,000, and even the last amount wouldn't buy half of his assets. Here I have been all these years paying strict attention to punctuation, spelling, diction, have written as long as he has sold lumber, and have not made one dollar where he has made five. Which illustrates what a mighty fine business retailing lumber is. If I had not paid strict attention to the way I had done my work; if I had not done it according to the requirements of the publishers for whom I have worked, where would I have landed? On my back somewhere, asking my rich relatives in the East if they would be so kind as occasionally to fire me out a dollar or two.

I don't know how many times I have said in this department that owing to the character of the retail business the man who engages in it may succeed when in other callings he would fall flat. Instead of telling others how to get rich I have a mind to turn little Dutchie out to grass, borrow enough money to buy a yard and get rich myself.

U. S. Consul Alfred J. Fleming, of Yarmouth, N.S., reports that a large lumbering firm has had the survey made and all other preliminaries arranged for a railroad from its mills at Caledonia to the sea at Port Midway, a little over 28 miles. The road, in addition to carrying lumber, will be operated for the general benefit, carrying passengers and freight. The country to be served by this line is rich in timber and somewhat settled, but at present the several mills operating in the interior are compelled to haul their output 28 miles by ox teams.

Centering Circular Saws

In a recent issue of the Wood-Worker a correspondent describes a method of centering saws which have eyes larger than the mandrel on which they run. It seems to me that better results could be obtained by having the outside collar on saw mandrel bored, say, 3/4-inch or 1-inch larger than spindle, and have it threaded inside. Then have a piece made to fit the saw mandrel and threaded to fit inside the collar and to reach nearly through same, and have a cone-shaped piece on the end next the saw. By letting the cone end of piece extend into saw eye, and screwing the collar against saw, then screwing nut on end of mandrel, the saw mill be positively and accurately held in place. Would like to know through the columns of your valuable journal if it is practical to run spindles at a high rate of speed (say 3,500 or 4,000 r.p.m), having 1 3/4-inch centres, and to do heavy cutting. It will be necessary for spindles to be adjusted from 1 3/4-inch centres to about 2 1/2-inch centres. If it is practical, what kind of gears should be used, all steel, or a combination of steel and rawhide, and what should be the construction of the gear and the relative position of one to the other?

THE WOODWORKER

During the recent annual meeting of National Coopers' Association at St. Louis, Mo., an address was delivered by President J. R. Kelley upon the subject, "How the hoop, stave and cooperage manufacturers can work in closer harmony." Mr. Kelley's remarks were as follows:

Beginning with the first part of the subject, the steel hoop men, as a rule, are not only the best of good fellows, but good business men, as well, who carefully study their business in order that the most up-to-date method be applied to increase their dividends. In my opinion to do this successfully, they must also watch and keep in mind the interests of their customers. If this be true, it seems to me, they could work in closer harmony with the cooper by giving us a little more consideration, and by taking an active lively interest in all economic and other questions that come up in our meetings affecting the cooperage industry which consumes such a large part of their product.

If my memory serves me right, a few years ago the question of flaring hoops at the mills came up and was carefully gone over at one of our meetings, some of the mills agreeing to discontinue flaring altogether, the others to make prices such that orders for flared hoops, which were usually small, coming from breweries and repair shops, would go to the cooper where it rightfully belongs. This agreement soon fell through and I understand now that only a small charge is made by the mill for doing this work, much less than the cooper can afford to do it for. In my opinion, this is wrong. The mills should stop flaring unless at a price that would give the cooper a chance to compete for the business at a fair profit.

Outside of these matters, I believe the cooper has little cause for complaint against the hoop companies. We have been treated more than fairly by extensions of time on contracts and advice from time to time when a raise in price was contemplated, with a chance to specify for a limited tonnage, usually sufficient to cover unfilled orders and contracts, all of which is a credit to the hoop companies and should be appreciated by the cooper. I question very much whether other large corporations would do as well by their customers. I believe, also, that it has been the aim of the steel hoop companies during the past few years to keep prices from fluctuating as much as possible, which is also a good thing, as it gives us the chance to figure the cost of our hoops at least six months ahead. Wouldn't it be a good thing if such a condition could be brought about and made to work in the cooperage industry? I mean by this, prices maintained on a fair profit basis.

Passing to the stave men—they may not be the best people on earth, but they are as good as the best. Like the cooper, you will occasionally find one that it is hard to do business with long business lines. However, it is not my intention to criticize or find fault, but simply offer a few suggestions which I think if applies might help the stave producer and cooper (who are so essential to each other) to work in closer harmony. It seems to me there is just a little lack of confidence between the two. I believe that if the stave maker will give just a little more attention to the culling, averaging and counting of his staves, using the most careful and best men in his employ for doing this work and whenever possible have a double check on both average and count, invoicing accordingly, it will help matters very much. In my opinion, the stave people are just a little lax in this work—in fact, too many of them just guess at averages, and if the cooper reports less than claimed, become very indignant, sometimes intimating that the cooper is unfair and trying to beat them, but by sifting the matter down, you usually find that these stave men know very little about either the average, cull or count, having left this matter with some employe who either lacked experience or was not very careful. However, I am glad to say that such differences come to us much less frequently now than they used to.

On the other hand, I must admit that there are some coopers that will and do take unfair advantage of shippers by either short counts, extra close inspection, heavy cull or dockage on averages, especially when they are well stocked up with material and the call for their product is light. However, this is the exception rather than the rule, as I believe most coopers dislike as much to report shortages or dockages of any kind as the stave man does to receive them. When a stave shipper finds a cooper of this kind he should refuse to make further shipments unless the purchaser will agree to unload his staves separately from others, reporting at once, count, cull, average, which, if not satisfactory, would give the shipper a chance to make another inspection and satisfy himself as to who was in the wrong, and it would only be fair for the cooper when such differences come up to stand at least part of the expense of the stave men in making these trips. In this way, I believe that confidence would be strengthened very materially.

Another matter, it seems to me, which could be remedied at least to some extent, is the fluctuations in prices. While we realize that supply and demand is bound to regulate and govern more or less, still I believe it would be much better if prices could be kept more uniform, the same as the hoop prices, which are usually steady and firm, while the stave market is always more or less unsteady.

Just to illustrate—a few weeks ago I was wanting both white and red oak oil staves, and sent out a number of letters asking for quotations, and, with few exceptions, each one having staves to offer made different prices. I placed orders for quite a few cars at the prices quoted, and a week or ten days later offered the same parties additional orders, but each one refused to book unless at an advance of from 50 cents to $3 per 1,000. During this time there was no advance in prices for made-up cooperage nor increased demand for staves that I could find that would justify any advance whatever in the price of staves.

Fire Insurance on Woodworking Plants

One of the expenditures which are part of the necessary operating cost of a woodworking plant is that for insurance. Protection from fire is so obviously necessary that there is scarcely a plant in the country which does not provide for indemnity against loss in one form or another. Fire insurance cost is therefore a fixed item in the overhead charge account of every woodworking establishment.

It is, nevertheless, true, however, that though this is a fixed charge, it is possible to reduce the cost remarkably by proper consideration of the special hazards pertaining to the plant and the possibility of reducing them. A saving can be made almost certainly, and the cost of making the necessary improvements is frequently very low, compared with the increased safety of operation and the lower rate secured.

The "base rates" which are in effect on most woodworking classes range from 2.50 to 3 per cent. That is to say, a plant which conforms to the proper ideas, from a fire protection standpoint, is charged $2.50 to $3 annual premium for each $100 of insurance. As a matter of fact, however, the rate usually paid by such establishments is much higher, 5, 6, or 7 per cent. being the charge usually made, the increase being due to the fact that the plants are not properly operated, as far as the fire prevention factor is concerned. There is no doubt that the operators of these establishments, by the adoption of a few simple changes, could lower the rate, not perhaps to 2.50 per cent., but certainly a considerable amount compared with that now being paid.

The insurance companies are more than willing to meet the woodworker half way on a proposition of this kind, for it is a well known fact that this class of risks is considered one of the most unprofitable that the companies have to write. They would be more than willing to apply a lower rate on an improved risk, for the reduction in the hazard makes it a better risk for the company, and the underwriters would much prefer to make a small profit on an individual risk than have to pay a high proportion of losses on business which was written at a high rate.

It is also true that by making the changes which can be put into effect without great cost, a sufficient reduction in the fire insurance rate can be obtained to more than pay for the cost of the improvements in a short time. The additional advantage of knowing that the chance for the business to be interrupted by fire is much more remote than before is one that appeals to every woodworking operator who has an established trade.

A brief consideration of some of the most common defects and the charges mode far them in the insurance rate will perhaps suggest the possibility of advantageous changes in individual risks.

Openings through floors, such as in the case of light wells or openings for stirways or elevators, are charged for, 25c usually being added to the rate for these. By inclosing the stairways and arranging for cut-offs of the elevators, as well as by closing the wells, unless they are absolutely necessary for the operation of the plant, would save this charge.

Methods of heating and lighting come in, of course, for a big share of attention. Stoves are looked upon as dangerous, and a charge for them of 25c. is made. If steam heat, carried by pipes free from wood work, and suspended by iron supports, is provided, no charge is made. Of course, the proper arrangement of the stoves will reduce the charge, and efforts should be made, if that mode of heating is used, to arrange them so safely as to make a blaze from that source remote. They should be placed on metal floor coverings, and should not be close enough to the walls to be dangerous. Inclosures of metal are advisable.

The most effective and least dangerous method of lighting is by electricity, provided the wires are properly installed. Fire insurance companies usually specify that the approved form is the standard of the National Board of Fire Underwriters, and deviation from this usually carries a charge. However, as it is easy enough to comply with the standard, there is no reason why the woodworker should not get the benefit of the lowest possible rate. Gas jets should be properly guarded, while, if kerosene or ordinary lamps are used, there is a heavy charge. As most establishments are equipped with more modern methods of illumination, however, this charge is not usually applied.

Watchman service is provided by many woodworking plants on their own initiative, in order that the chances of fire, when the plant is not in operation, may be eliminated as far as possible. Such service is recognized by the fire insurance companies, who place a charge of 25c, for failure to have service of this kind.

The dry kiln is a source of much consideration, and the woodworker who has his kiln properly constructed and heated enjoys a much lower rate compared with the operator who pays relatively little attention to protection at that end of the plant. If the kiln is not enirely cut off from the rest of the plant, if it is heated by stoves or furnaces in a room not fireproof, or if any method of heating does not have its origin in a fireprof building, charges ranging from 50c. to $1 are made. The carefully constructed kiln, not connected with the main plant, and heated from fireproof sources, gets so low a rate as to make this type of structure well worth while, even from the sole standpoint of insurance cost reduction.

The boiler and engine room of a woodworking plant offer many hazards, and consequently deserve much consideration in construction. They should be of brick or stone, and fireproof. The boiler should be properly set, covered with brick and separated from engine room by brick standard wall. All openings should be protected by double standard fire doors, except shaft, belt and conveyor openings, which should be made as small as possible. The boiler and engine should be on independent foundations, and the boiler room should be equipped with hydrant and hose, and, unless fireproof, should be well ventilated.

If the boiler room is in the main plant or in communicating frame building, without brick wall cut-off, a charge of $1 is made in the rate. Frame construction is also charged for. Disposal of shavings and other refuse in the plant by means of automatic feeders is an approved method, though for allowing shavings to accumulate in a vault which is not fireproof, and is located in the boiler room, there is an extra charge.

The disposition of the boiler stack should be so arranged as to reduce the hazard, and failure to do this carries a heavy charge, usually 75 per cent. If not safely arranged and inside main building, the charge is even greater, as the exposure is, of course, increased.

Planers, sanders, stickers, headers and jointers should be equipped with blower and dust pipes. Where this is not done, a charge of 10c. for each machine is added.

Handling oils, paints, etc., is a more or less dangerous proposition, and the careless handling of material of this kind is discouraged. For instance, not greater than one day's supply of oils should be carried in the building. Drip cups should be placed under the bearings to prevent oil from soaking into the woodwork or impregnating shavngs, dust or other refuse. Electric generators and dynamos, gasoline engines and other power equipment should be in all cases cut off from the main plant. The reason for this general proviso, naturally, is that a fire could easily start in that part of the plant, and, if properly separated from the rest of it by brick walls, the danger of a general fire would be small. On the other hand, if such cutoff is not provided, the danger is imminent of the destruction of the entire plant if a fire starts in the power building.

If there is a machine or repair shop maintained, this, with the exception of a saw-filing room, should be located outside the main plant. Fire protection in the establishment should be provided by casks and extinguishers, the approved idea being one chemical extinguisher for every 2,500 square feet of floor space.

It is important that the general condition of the plant be good. Sawdust should not be allowed to accumulate, and oil should not be permitted to drip. Not very long ago a big establishment was destroyed by fire, and the cause, as far as it could be determined, was spontaneous combustion from oil-soaked sawdust.

Practical inspection men employed by insurance companies agree that the usual defects which are found in woodworking plants, and which add most to their rates, are failure properly to cut off the boiler room' improper stock clearance—that is, the top of the stack being too close to the roof—and the careless handling and burning of refuse.

The next time your fire insurance business is being solicited, make a point of having your plant carefully inspected and defects noted. The schedule which will be returned, showing the charges for various features of construction, arrangement of equipment or method of operation, will suggest many things, and a little co-operation with the underwriter should result in a material reduction in your rate.—G. D. C., in the Wood-Worker.

The Rule of Temperature

Probably there may be found a great many rules and regulations about the temperature of a glue room, of glue, and of the stock to be glued, but one of the simplest and best for general observance is to have the stock to be glued, and the glue room, of practically the same temperature. There may be objections raised to this, and there are occasions when it is well to depart from it, but it requires an expert to judge these occasions, and experts require no specific rules of this kind to aid them in their manipulation. For those less familiar with glue room work, it simplifies things wonderfully.

The object of having the stock of practically the same temperature as the room, is that then the glue is not directly affected on being spread, by the temperature of the stock itself, and has a greater tendency to remain in just the condition it is when being spread. To illustrate, if the stock should be brought, cold, into a warm glue room, it would have an immediate chilling effect on the glue liquid. If it is brought to the work hot, from a hot room, it has the opposite effect and tends to thin the glue spread on it, and to absorb it more freely. This tendency, of course, is governed by the relative difference in temperature, and this adds uncertainty to the work. Therefore, it follows that the simplest way is to have the stock, both the core stock and the veneer, of practically the same temperature as the room, because then the glue acts more naturally and you are better able to anticipate just what it will do when spread, how soon it will set, how much it will take, how far it will spread, etc.

As to just what temperature this should be, there is quite a difference of opinion. We may say it should not be lower than 70 degrees, and it is difficult to keep it above 100 because of the discomfort. Anyway, if one will keep his glue room somewhere between 70 and 100 degrees, and keep the stock to be used standing in the glue room quite a while before it is used, it will gradually approximate the same temperature, and the work of gluing will be materially simplified and there will be less occasion for failure—provided, of course, the glue room is kept properly free from drafts.

The Veneered Front Door

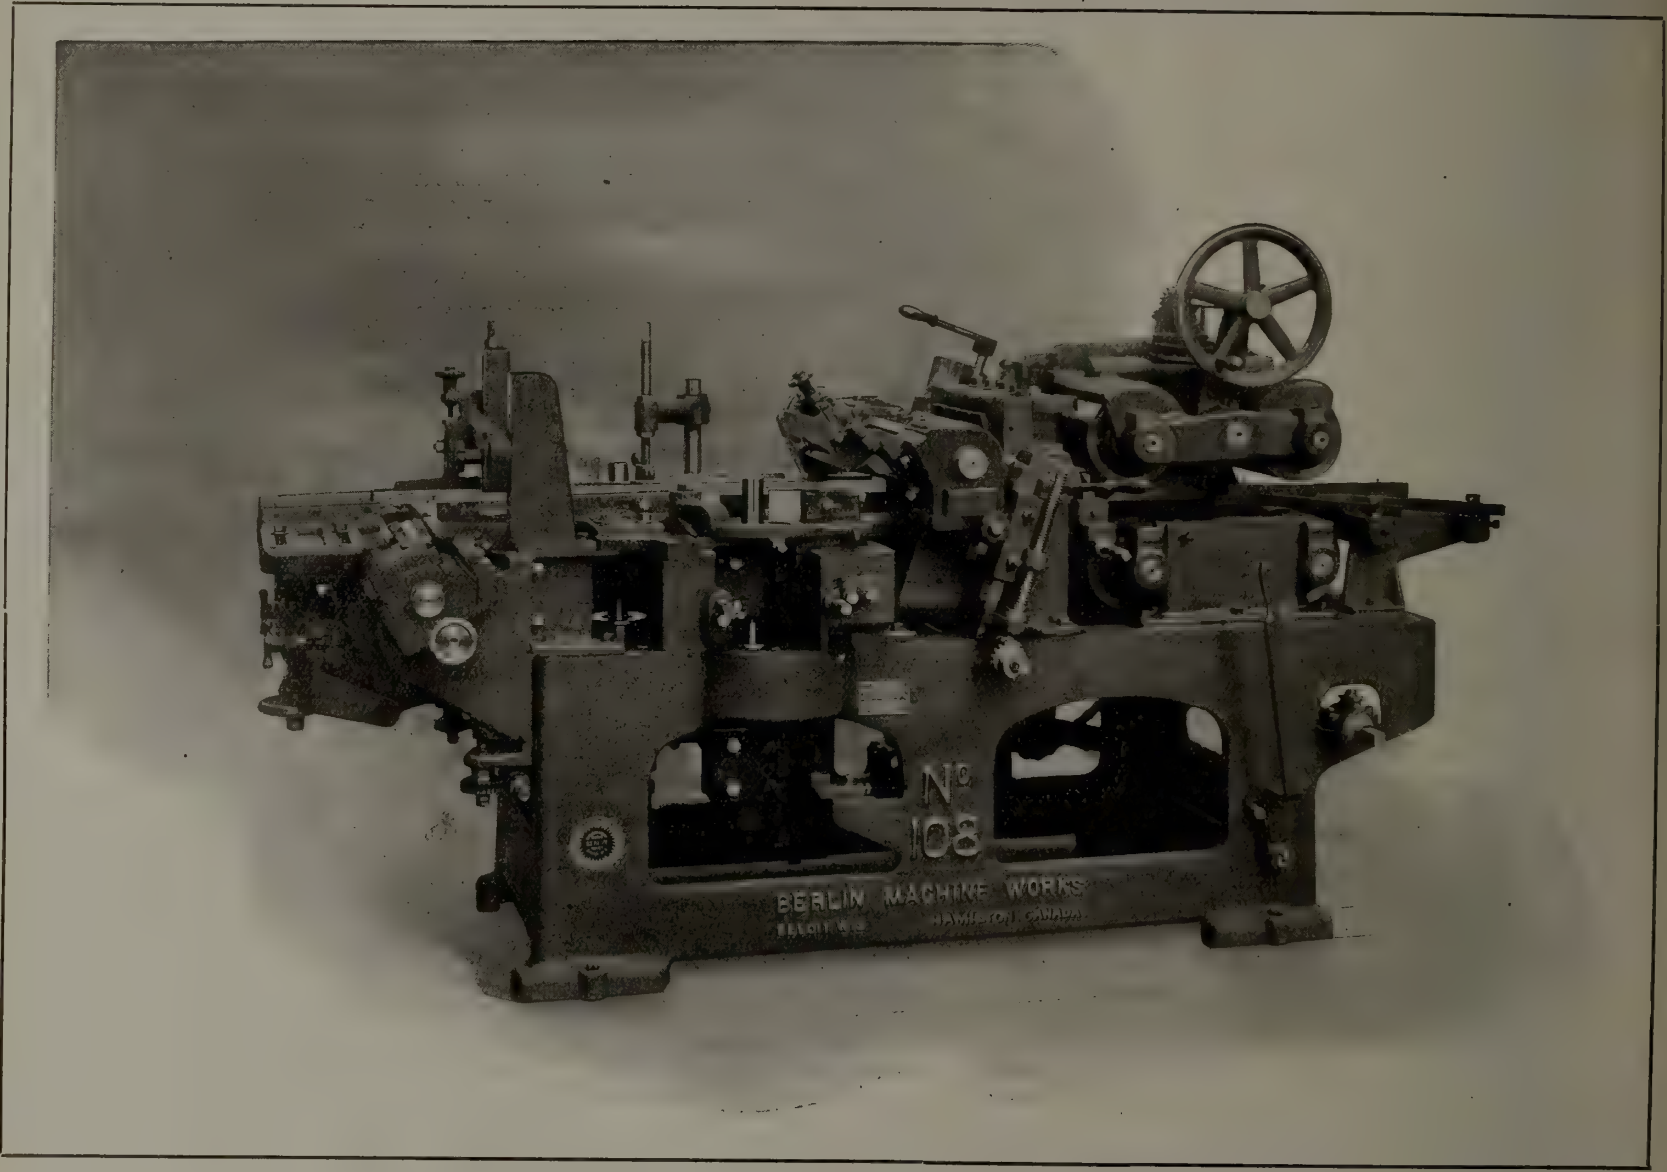
One of the most prominent wholesalers of birch veneered doors in the country takes exception to the unqualified statement recently made that the veneered door is not an outside door. Admittedly, he says, it is not a door that may be put on the outside without any protection whatever, so that the rain and sun beat against it, but this, he claims, does no alter the fact that one of the big items in the veneered door business is the veneered front door. The point made by the door man is that where a front door is protected with 6, 7 or 8 feet of verandah, and any due care taken of it, the veneered door will stand quite a lot of slopping with water and drying off, even if it won't stand what might be termed outside exposure to weather on, say, the south side of the house. To give out the unqualified statement that the veneered door will not stand outside exposure, the door man contends, is likely to create a wrong impression and lead people to believe that it isn't safe to use the vneered front door, while the facts of the matter are that veneered front doors are used in many of the best modern houses, from cottages up, where they have verandahs or any protection against the severe weather.

There is being made considerable progress in waterproof glue, and by and by we may have doors that will stand any kind of exposure. But meantime, as the door man says, the veneered door when properly made and protected with varnish and paint on the edges as well as on the face, will stand quite a lot of wetting without doing it harm. The manufacturers of a famous door say in their catalogue that veneered front doors, where exposed to the weather, without porch or verandah protection, should have two heavy coats of varnish more than inside doors, and all the coats should be applied to the edges as well as to the flat surface, and the top and bottom edges should be painted, and, of course, one should use exterior varnish. This well known concern gets out a special catalogue of veneered front doors, and that it continues to sell enormous quantities of them is pretty good evidence that they will stand quite a lot of weathering if properly cared for. This suggests that possibly much depends on how the door is put together and protected with paint and varnish, as to its weather-resisting qualities.—The Wood-Worker.

The Allis-Chalmers Company, Milwaukee, Wis., have issued an interesting bulletin, No. 1079, upon steam turbines and generators, which should prove interesting to lumber manufacturers. The bulletin is excellently illustrated and shows the application of these turbines and generators to the uses of various classes of industry, particularly that of the manufacture of lumber. The Allis-Chalmers steam turbine presents features of excellence which give it a unique and well deserved popularity among manufacturers. Those who are interested in the development of power for sawmilling purposes will do well to communicate with this firm, as they manufacture not only steam turbines and generators, but a general line of thoroughly serviceable sawmill machinery.

"The

BERLIN 108 OPEN



No 108
BERLIN MACHINE WORKS
HAMILTON, CANADA

Berlin Machine

Hamilton -

Original"

SIDE MOULDER

The No. 108 is not an inside moulder nor an outside moulder. It is a combination of the good features of both these types. From the inside moulder we have used the solid bed, the powerful feed works, and the rigid cylinders. From the outside moulder we have used those desirable features of accessibility.

The No. 108 is a heavy substantial machine built on a rigid one-piece frame which forms a very solid foundation for the working parts. There is no overhanging machinery, for the working parts are all built directly over the frame. This one feature goes a long way toward making it the most substantial moulder built.

The No. 108 has other features which you will appreciate. Glance at the picture and note the large powerful feed works, the rigid mounting of the cylinders and side head spindles, and the long adjustable wooden shoe which bears firmly on the stock all the way through the machine.

Then there are features of accessibility which can not all be seen in the picture but you will appreciate these when we tell you. The knives are easy to get at when you want to alter or sharpen them. All adjustments are made from the front side of the machine.

But, here is the point which is most significant in the value of the No. 108. It is the product obtained by expert designers who have been over the moulder proposition from A to Z and back again a great many times. In this moulder are contained the latest improvements known to modern wood working machinery construction.

To you these fine mechanical points are of little interest, but you who are daily using wood working tools appreciate most keenly how much profit there is to be obtained from a good moulder.

45 No. 108's sold and shipped last year. Why? Because one man bought, others learned what he was doing with it, and bought too.

If Berlin Tools are a "dollars and cents" proposition in his business why not in yours?

Before you decide on a moulder, we would like to explain the No. 108 to you. We are sure you will then appreciate what we mean by the term "Original Open Side Moulder."

CAMP DEPARTMENT

Log Scaling in British Columbia

By Andrew Haslam, Vancouver, B. C.

The Doyle rule was used in British Columbia previous to 1902, and each mill had its own scaler, who scaled all the logs bought or logged for the mill. The Government appointed several scalers without salary, that could be called on in case of dispute. The system was not satisfactory and gave rise to a great many disputes that were difficult of settlement.

In 1901 the Government appointed a committee to formulate a log scale that would correct the errors of the Doyle rule. The committee were Messrs. Alexander, King, and the writer. Mr. Alexander represented the mills, Mr. King the loggers, and the writr the Government interest. This committee ignored all previous rules and to arrive at an accurate result had a drawing made of the end of each size of log from twelve inches diameter to 73 inches, including both. The drawing was made showing a slab three-fourths of an inch thick on each of the four sides. Inside of the slab a kerf three-eighths of an inch, then the log inside that was laid off in inch boards and three-eighths of an inch kerf alternately. Everything three inches and over in width was calculated in the contents, but under was not.

Logs that are not round are measured two ways, and the mean diameter on the small end is taken for calculating the contents of the log up to forty feet long. Over forty feet there is an increase in the diameter of one inch for each ten feet over forty feet.

The rule made on this base was legalized by an act of the legislature in 1892 and was named the "British Columbia Log Scale," and the use of it made compulsory west of the Coast Range Mountains. East of this the Doyle was legal until July 1st, 1909. The British Columbia log scale is now legal all over the province.

The old method of allowing the mills to have their own scaler was legal until July 1st, 1906, when the Government appointed a supervisor and scalers to do the work west of the Coast Range of mountains. In making these appointments the Government pays a regular monthly salary and charges five cents per thousand feet for all scaling, or, if called for, grading. The mill is supposed to pay all the scaling fees, but charges the logger one-half.

When scalers are required, there is an order sent to the supervisor's office, who sends out the first scaler reporting after receipt of the order. In this way neither the millman nor the logger knows who will be the scaler. Either party has a right to demand a rescale. The scaler who does the rescaling is not allowed to make up his boom; he simply sets down the length and diameter of the log and the contents is calculated in the office of the supervisor, so that there can be no collusion between scalers. If the rescale is within three per cent. of the original scale it is held to verify the original. If it is over three per cent., there is another scale by one of the scalers or by the acting supervisor. The supervisor's or assistant's scale is final and there is no appeal from it.

In August, 1906, the loggers and millmen met and agreed on rules for grading all logs, except cedar. The Government consented to the use of these rules, which gives them a permanency in so far as the Government's consent is concerned, but there is nothing in the statutes to make them legal. The following is a copy of the rules:

Flooring—Logs suitable for flooring, reasonably straight; not less than 30 inches in diameter nor less than 20 feet long; clean; free from such defects as would impair the value for clear lumber.

Merchantable—Logs not less than 14 inches in diameter; sound; free from rotten knots or bunch knots; reasonably straight; the grain straight enough to insure strength.

Rough—Logs having visible defects, such as crooks, bad knots or other defects that would impair the value and lower the grade below merchantable.

Culls—Logs which will not produce 50 per cent. of their contents in salable lumber shall be classed as culls.

In all cases the scaler has the right to use his own judgment. There are defects characteristic of timber in certain localities for which it is impossible to make rigid rules.

On July 1st, 1909, the British Columbia log scale was legally extended over the whole province and the Government is now putting the necessary machinery in force to make its use compulsory over the whole province.

Take the scale as a whole, and the method of operation, I believe it is as free from defects or from influence of either parties interested as it can be at the present time. No doubt changed conditions may make changes necessary, but so far I believe there has been an honest effort to do what is fair between man and man. I believe the effort has been fairly successful.

Hardwood Timber Estimating

Timber estimating primarily is ascertaining the quality, quantity and varieties of timber on a tract of land, but in its full sense and in practice it includes a study of conditions, such as the possibility or frequency and time of overflow, the nature of the soil, location of waterways and all other conditions that affect the value of the property and the cost of moving and manufacturing the timber into lumber, says H. M. S., in the "Pioneer Western Lumberman."

Varieties: The families are usually known by the holders of timber, but they ofttimes do not know the varieties or species, and this is of much importance in valuing timber. Take, for instance, the family of oaks—there are perhaps fifty species known to botanists, and of these there are ten or fifteen growing in one locality of this country and known and recognized as distinct on account of characteristics that appear in the manufactured lumber.

Quality: The quality of timber is affected largely by local conditions, such as the thickness of stands, the quality of soil, undergrowth, etc. It is of much importance to know the approximate age of the timber, to know the damage from bugs and worms occasioned by fires, to know the effect of water standing on the ground to any great depth and for several months in the year. Timber on the mountains is tougher and has thinner sap than timber growing on the flat land, on account of the greater effect of the sun's rays, and the lack of moisture; the same causes keep the hill timber from making its maximum growth and also makes conditions favorable for fires.

Quantity: There are several methods used in ascertaining the quantity of timber on a tract, which amount (for milling purposes) is expressed in thousands of feet, board measure. The diameter (at a certain distance above the ground) of the smallest tree considered should be given in the estimate, as, for instance, all merchantable timber 16-inch and up, breast high.

Estimating by comparison was, until recently, the only method used in this country. The estimator or cruiser rode through the timber until he had seen it to his satisfaction, and, having seen other timber cut out, drew his conclusions by comparing the known tracts with the one being looked. This method gave the quantity near enough to satisfy when timber was very cheap ,but the increased price of stumpage has been the cause of more accurate and painstaking methods.

The "strip estimate" is one much used at this time and gives satisfactory results. I will describe it briefly.

The estimator and one (or two) assistants subdivide the tract into 4-acre blocks, then a lineman is started on one of the lines previously run, and the estimator takes a position 55 yards inside the strip to be counted, then both go forward, the estimator counting the trees and calling them to the lineman, who tallies them, each variety being kept to itself. When you have gone forward one-quarter mile you will have listed all the timber on five acres, or, if two linemen are used, the second man keeping himself on a straight line, as the estimator does, by means of a hand compass, twice the amount can be counted in the same length strip. Now the estimator by observation and actual measurements can decide on the number of board feet the average tree of each class contains, and by multiplying these average tree amounts by the number of trees of each kind counted, you have obtained as nearly as possible, without actual measurement, the amount of timber on the strip counted. These counted strips are then used as a basis for estimating the balance of the timber, the frequency of the counts being governed by the regularity of the growth.

Another method, and a more accurate one, is the "tree to tree' method, in which the estimaor and one assistant go to each merchantable tree, estimate and record the amount it will cut in board feet, and mark the tree so that it will not be taken into consideration again.

Calipering gives good results where the woods are open, but in brushy or cane woods the method is too costly.

Tents and Awnings and Lumbermen's Supplies

The Peterborough Tent & Awning Company, Peterborough, Ont., manufacturers of all kinds of tents and awnings, and also of lumbermen's and contractors' supplies, report that their business is growing at a rapid and encouraging rate. They have been obliged to increase their accommodation considerably of late, and find even yet, that they are in need of more room. The firm are shipping a great quantity of goods to the west, as they have a large trade in British Columbia. Their goods are also sold extensively in the Maritime Provinces and Prince Edward Island. Readers of the "Canada Lumberman" who are in need of supplies such as this company produce will do well to communicate with them.

WANTED & FOR SALE DEPARTMENT

PUBLISHERS' NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line ($2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

WANTED—LUMBER, ETC.

Lath Wanted

We want to buy, for cash, all the White Pine and Spruce Lath, all grades, that you have. Communicate quick with Allegheny Lumber Company, Pittsburg, Pa. 9-10

Lumber Wanted

Have you any stock which you wish to sell? If so, make the fact known to probable buyers by placing an advertisement in the Wanted and For Sale Department. Address Canada Lumberman, Toronto.

Wanted

4-4 to 12-4 Log Run Birch, Maple, and Elm. Spot cash paid for stock as loaded.

AMERICAN WOODS CORPORATION,
Old South Building,
Boston, Mass.
7-10

Tank Lumber Wanted

We require 2-in. and 3-in. Tank White Pine, 6-in., 7-in., 8-in. and 10-in.; 10 ft. to 24 ft. Also red pine. Highest prices for Pump Squares. Ontario Wind Engine & Pump Co., Ltd., Toronto, Ont. 7-tf.

Spruce Limits Wanted

Wanted to buy Spruce and Pine limits in Eastern Canada, 100 to 250,000 acres. Option must be granted. Principals only, no agents. Apply Sieveking, Podmore & Wright, 57 Grace street, London, England. 8-11

Lumber Wanted

We contract and pay the highest cash price for hardwood lumber stocks. Take the entire car, large or small and dry stock for immediate shipment. Reply to Box 250, Canada Lumberman, Toronto, Ont. 7-10

Wanted—Ash, Elm and Oak

Wanted to purchase, for export shipment, Ash, Elm and Oak. Kindly state price and point of shipment. Address, with full particulars, Robert Cox & Company, Hope Building Ottawa, Ont. 9-12

Lumber Wanted

We will pay cash for Basswood, Soft Elm, Birch, Hard Maple and Black Ash, in straight or mixed car loads. All thicknesses. Johnston Lumber Company, John Street, Toronto. 9-10

Lumber Wanted

Would like to hear from mills having Spruce Lumber, Lath and Cedar Shingles to sell, which can be shipped to New England territory. Would contract for mill cut or handle on commission basis. Address with full particulars. Wendell F. Brown Co., 38 Kilby street, Boston, Mass. 5-10

FOR SALE—LUMBER, ETC.

For Sale

Sixteen thousand second grade ties, in good shipping condition, on Grand Trunk Railway. Apply Box 251, Canada Lumberman, Toronto, Ont. 7-10

Spruce for Sale

For Sale, 90,000 feet 1 x 7 and up, No. 1 Spruce. 70,000 feet 5-4 x 4 and up No. 1 Spruce. For prompt shipment. The Elgie & Jarvis Lumber Company, Limited, Toronto, Ont. 10-10

Cedar For Sale

Cedar posts and poles, any size posts sorted to suit your trade, any length or size poles. Ready for immediate shipment. Address, T. A. Wilson, Cannington, Ont. 9-10

For Sale

Several cars of 1-in. No. 2 Barn and better White Pine; 200,000 ft. 3-in. good Hemlock, largely 13 ft. Rail or water shipment. B11 Board of Trade Building, Montreal, P.Q. 9-14

For Sale
Hardwood and Hemlock

If you want to buy Hardwood or Hemlock or Ties, Posts and Shingles, visit limits and make an early contract. Pay as work progresses. Can get you 5 or 10 million feet of each on Georgian Bay. Box 266, Canada Lumberman. 9-16

For Sale

4 cars 1-in. Ash, No. 1 C. and B.
2 cars 1¼-in. Ash, No. 1. C. and B.
6 cars 1½-in. Ash, No. 1. C. and B.
4 cars 2-in. Ash, No. 1. C. and B.
6,000 Cedar Telegraph Poles, 30 to 50 ft.

GEO. C. GOODFELLOW, Montreal.

For Sale

10 cars merchantable Hemlock, 3x6 and up, 12-13 feet.
2 cars 1¼ x 4 ft. M.R. Spruce Lath.
1 car 1½ x 4 ft. M.R. Basswood Lath.
1 car 1¼ x 3 ft. M.R. Basswood Lath.
500,000 ft. 1-in., 1¼-in., 1½-in. and 2-in. M.C. White Pine.

FRED T. SMITH,
310 Board of Trade, Montreal.

FOR SALE
For Immediate Shipment

2 cars extra choice 6-4 Highland Soft Elm.
3 cars 4-4 White Basswood.
1 car 3-in. Hard Maple.
1 car 4-in. Hard Maple.
1 car 5-4 Soft Maple, extra wide.
1 car Cedar posts, 5-in. top and up.
4 cars Cedar posts, 4½-in. top and up.
200,000 ft. 2-in. Hemlock, Dry.

FOR SALE—MACHINERY, ETC.

FOR SALE

Small Band Sawmill, Waterous make, complete with filing room tools, and Gang Edger, Live Rolls, Slab Slasher, Shingle Machinery, Shafting Gearing, Etc., also, Dynamo and Motor. Also a large number of factory Machines, comprising Matchers, Moulder, Band Rip Saw, Variety Saw, End Matcher, Shafting, Belting, Shaving Exhauster and Pipes, Dry Kiln with Steel Cars, Engine and Boiler, Etc.
2-tf. JOHN FINDLAY, Owen Sound.

WANTED—EMPLOYEES

Advertisements under this Heading two cents a word per insertion.

WANTED—Millwright; first class man for saw mill. Address Cleveland-Sarnia Saw Mills Company, Limited, Sarnia, Ontario.

WANTED—First-class Stickerman. Send references with your reply. Apply Box 272, Canada Lumberman, Toronto, Ont. 10-10

WANTED—First-class Travelling Salesman. State experience, age, etc. A. R. Rogers Lumber Co., Limited, Enderby, B.C.

WANTED—Traveller, general planing mill man, capable of estimating. State age, experience and references. Apply Box 274, Canada Lumberman, Toronto, Ont. 10-10

WANTED Sawyer for twelve-inch band resaw for New Brunswick mill. Apply stating experience and wages expected. Henry Disston & Sons, Limited, Toronto.

WANTED—Shingle sawyer for Perkin's Favorite machine, day or job, also packer, also stationary engineer, no certificate required; good season. Apply to J. C. Murphy & Company, Tobermory. 9-10

WANTED—Chief Engineer, for saw mills; man who is a first class machinist and thoroughly understands care of saw mill machinery. References must be furnished with application. Address Cleveland-Sarnia Saw Mills Company, Limited, Sarnia, Ontario..

WANTED—EMPLOYMENT

Advertisements under this heading one cent a word per insertion. Box No. ten cents extra.

WANTED — Situation as mill foreman. Gauge or Circular Saw Filer. Thoroughly understands the lumber business. Box 268 Canada Lumberman, Toronto, Ont. 10-10

Reliable young man of good appearance, with experience in lumber trade, speaking French and English, quick and accurate at figures, desires position of trust, good salary expected. Can furnish references. Box 270, Canada Lumberman, Toronto, Ont. 10-10

If you want an employee for any branch of the lumber or woodworking trade the best, quickest and cheapest way to get him is by placing an advertisement on this page. Canada Lumberman and Woodworker, Toronto, Ont.

BUSINESS OPPORTUNITIES

For Sale

Saw Mill of 30 to 35 M. feet daily capacity, complete with engine, two boilers and lath machinery. For particulars write to E. D. Croden, Box 596, North Bay, Ont. 3-tf.

Sash and Door Factory

Partner wanted with $5,000 to $10,000. Practical man to take full charge or will sell on easy terms. Apply Box 259, Canada Lumberman, Toronto, Ont. 7-12

Timber Limits For Sale

Can be quickly and profitably disposed of by advertising them on this page. This is where buyers of timber property look for opportunities to invest, if your "ad" is here the investor will see it. Canada Lumberman, Toronto, Ont. tf.

For Sale

Steam Sawmill and Planing Mill and about seven million feet of standing timber for sale in the township of Christie, on Grand Trunk Railway, 12 miles from Parry Sound. For terms and other particulars write S. Armstrong, Assignee, Parry Sound, Ont. 7-10

Timber and Land Investment

Farm of three hundred acres within 35 miles of Toronto—one hundred acres of which is timber land—Pine, red and white Oak, Maple, Beech, Basswood, etc. Balance of farm is under cultivation, thirteen acres bearing apple orchard. Buildings cost over five thousand. Price, $29,000. Box 160, Canada Lumberman, Toronto, Ont. t.f.

Salesman Wanted

Large American firm making Adjustable Cutter-Heads and Dado Cutter-Heads, wants to get in touch with good salesman calling on manufacturers of furniture, interior finish, bank and office fittings and mantels, who can sell cutter heads along with regular line. Man connected with saw and knife trade preferred. Apply E. J. McIntyre, 4059 Perry street, Chicago, Ill. 9-10

Steam Saw Mill For Sale

For Sale—Small Steam Saw Mill, complete with trimmers and lath mill, capacity 15,000 feet per day. Price, including mill frame of sawed pine timber, $1,500 f.o.b. cars. Reply to C. H. Sheppard, Waubaushene, Ont. 7-11

Canadian Timber Limits

Bought and Sold in all parts of Canada

Some excellent investments open in British Columbia at moderate prices.

British Columbia

SAW MILL, TIMBER LANDS, MINING PROPERTIES, ETC.

Saw and planing mill, capacity 30 M. in 10 hours; six thousand acres timber, 70 million feet; mill and timber $70,000. Farm with good residences with cattle, hogs and poultry, 3,000 acres freehold land; $30,000. A responsible purchaser with about $25,000 cash can handle this, balance of payments spread a period of 10 years, or more if desired.

Also several mining properties, iron silver, gold and lead, on half share for development work.

Saw and planing mill, capacity 40 M. in 10 hours, splendid situation, rail and water transportation. Mill and plant with several good residences and fruit orchard, price $60,000. 10,000 acres virgin timber lands, estimated to contain over 100 million feet, price $50,000.

Terms—$30,000 cash, balance in easy instalments. Owner retiring from business. Apply Box 258, Canada Lumberman, Toronto, Ont. 7-12

MISCELLANEOUS

A Valuable Timber Limit for Sale

Timber Berth 1199, containing about one hundred million feet, principally spruce, of a very superior quality, well situated for economic handling. A railroad is under construction which will pass within one mile of this limit. There is big money in this proposition for the right party. Easy terms for payment. For further particulars apply to Room 1, Archibald Building, Edmonton, Alta. 10-13

The Quick-Set Saw Gage

It has always been a wonder to me, says a writer in the Wood-Worker, how so many people here and there over the country cannot seem to realize the labor and time-saving virtues of a positive and quick-set saw gage, whether it be for the rip or a cross-cut saw. A positive gage, one that you know is just so when you set it, and one that you do not continually have to keep checking with a rule to see whether your gage has slipped and ditched some work for you, is a time-saver and a money-maker any place, but more especially so where there are a great number of changes in the day's work. It is pitiful the way some cutters have to clamp a hand-screw onto a block and then shift it along if it doesn't happen to be just right, by bunting it with the stock, and keep everlastingly checking their work with a rule, or run the danger of their block shifting under their clamp.

Logging in Malaysia

In the great hardwood lumber tracts of Malaysia many concessions are being granted, and in most instances the American system of logging is being adopted and American machinery used. One company has a concession 34 miles long and 10 miles wide on a heavily wooded island, upon which a large amount of American machinery is being installed, and the entire concession will be operated on the American system. Some of the finest hard woods known to the market are plentiful on this grant and the finished lumber will be shipped to the European and American markets. Some hustling young Americans have charge of the operations, but the company is controlled by Dutch capitalists.

Heretofore the logging operations in Malaysia have been carried on in the most primitive manner. The jungles of this great area, including Borneo, Java, Sumatra, Celebes, New Guinea, and Malay, with hundreds of small islands, are replete with valuable hard and soft woods and the world is now beginning to come to these regions with increasing orders, so much so that the primitive systems of logging are gradually giving way to up-to-date methods, and of these methods the American system is far in advance, and the larger companies are beginning to adopt our machinery in their operations. Several large Dutch mills are using it and hundreds of thousands of dollars will be invested in it before long. One firm is now putting up over $100,000 worth of American logging machinery to be operated in a very large concession on an island 70 miles long, off the coast of Sumatra.

North of the Malay Peninsula in Burma a large logging business is done. On one large concession 6,000 elephants are employed and each elephant represents an invested capital of $2,000. An American steam logging outfit would cost not much more than one elephant and would do ten times the work. Timber is dragged sometimes over 100 miles by elephants in the primitive Burma operations. Here is a field for our machinery, but it can only be placed by energetic representatives who understand the machinery and know something of conditions prevailing where it is to be used.

"Cutting Out" in Joinery Works, Etc.

The careful "cutting out" of timber in joinery and cabinet work is a factor of considerable importance in economical management, but is one that does not always receive the attention it deserves by operators, consequently an unnecessarily large pile of short ends is the result. T. R. Groom says: "By carefully following a few rules a good deal of this might be saved—for instance, when cutting out, say, a quantity of door stuff, always cut the stiles off first, for they are the longest pieces and generally the most difficult to get clear of knots and shakes. If the stiles are 4½ x 1½ in. it is best to rip the 9 in. board down the centre; you can then cut out the long stiles between the knots, and the short ends come in for short rails. This simple rule applies to most classes of jobs that have to be cut out. In builders' mills there is frequently an outlet for using up short ends of timber, such, for instance, as bridging — short pieces of deal about 2 x 1½ in. stuff to fix between joists. A lot of waste can also be worked up into wood blocks for floors."

Raising Steam

Always raise steam slowly or unequal expansion is set up, which is very detrimental to the boiler. If the boiler is damped for the night be sure there is a proper supply of water before lighting the fire, so that the furnace tops are not exposed to the direct action of the flames, or collapse may be set up.

In cases where is it necessary to raise steam rapidly a good plan is to nearly fill the boiler with water and have bright fires, then the whole body of water above the firebars will grow hot, whilst that below the furnace remains cold. As soon as the boiling temperature has been reached, and the open safety valves are blowing off steam, the latter should be shut off, the blow-offcock opened, and the lower cold water run out, till the lower boundary of the upper hot water touches the boiler bottom. The whole boiler will then be of a uniform temperature, and the raising of steam can be proceeded with at a fairly rapid rate.

Many good boilers are ruined through forcing the fires.

Average Day's Work

"A good day's production for a high-speed modern deal frame (not taking exhibition records into consideration) is the sawing of about 200 spruce deals, 12 x 11 x 3 in., with three cuts in each deal," writes "A. M." "When the saws are freshly sharpened the feed speed may be fixed at from 3½ to 4 feet per minute, which feed, if reckoned by the hour, would give a much higher output than what is stated. The time of altering or changing the saws, however, must be considered, which means that any machine of this description can have no more than 6 to 6½ hours' continuous cutting in a day of 10 hours. With softer or milder woods more surface sawing can be done than when cutting white pine. Regarding comparing the deal frame with the band re-saw, each type of machine has its respective advantages, which entirely depend on the nature of the work being done."

Centrifugal Force in a Pulley

How many have ever stopped to think of the tremendous amount of centrifugal force generated in a large pulley? It is no wonder to me sometimes that wooden pulleys give way, when they are placed on shafts without a thought as to the speed for which they are fitted and the limit of speed above which it is dangerous to go. I have often thought that the continual thumping of a badly-laced belt might occur at some particular section of the pulley, and gradually weaken it until it gives way under the pressure of centrifugal force. It has been my experience, at least, that part of the pulley only flies when it gives way.

Match Making Destroys More Forests Than Paper

The manufacturer of matches is doing more toward wiping out the great forests of the nation than the manufacturer of paper from wood pulp, according to a statement of Curtis Guild, Jr., president of the American Forestry Association, in his recent annual address at the New Willard Hotel, Washington. The reason assigned by Mr. Guild for this condition is that the paper manufacturers, realizing that conservation of the wooded sections is imperative, take from the forests scientifically, while the match makers take every tree, regardless of ultimate result. President Guild made an impassioned plea for support in securing the passage of the Appalachan forest reserve bill on February 15. He cautioned the delegates against permitting the consideration of amendments, claiming that would be simply a play to secure postponement and ultimate defeat. Mr. Guild pointed out that for many years the Atlantic coast has paid its part toward the $4,000,000 annually appropriated for the care of the 195,000,000 acres of forest reserve in the west, and said that nothing had ever been given the Appalachian slope for the creation of forest reserves.

Review of Current Trade Conditions

Ontario.

The building situation in Ontario seems to be better than usual at this time of year, and yet, only in certain parts of the country is there any improvement to note in the lumber trade. Throughout the district east of Toronto as far as Central Ontario. trade is reported almost dead, with one or two notable exceptions. Prominent among the exceptions is the town of Oshawa, which has recently obtained a splendid name among travellers as being one of the most progressive towns in Ontario. Travellers who have recently visited other towns in this district report that the farmers are rather depressed on account of the killing of the winter wheat by the recent frost. In many places they learned that the farmers were ploughing the winter wheat into the ground and preparing it for some other crop.

A welcome contrast to this condition is afforded by the reports from southwestern Ontario. Although trade in this part of the country is not abnormal nor even as extensive as might have been expected, it is moving along fairly well, and prices remain steady. The lumber trade across the line is not as active as it might be. In Michigan, travellers are meeting with considerable dulness. Trade is spotty and dealers seem to be troubled by some sort of apprehension about future commercial conditions. No definite reason can be given for this except a general feeling of nervousness about the course of the monied interests of the country. The old cry is heard occasionally that these classes are watching keenly for an opportunity to teach the public a lesson about the futility of trying to hold down railroad freight rates and of fighting the trusts. A depressing effect, so far as the lumber trade is concerned in the State of Michigan, is produced by the strike of the factory employees in the great furniture industries of Grand Rapids. For these reasons Canadian lumber is not meeting with much demand at present in that State.

The situation as seen by the mill men in Ontario is still fairly satisfactory. Stocks of logs were secured last winter under more favorable conditions than usual and the season is opening up with good indications for an active demand for the rest of the year. As a result, all of the mills are now actively operating and are looking forward to a good year's business.

Eastern Canada.

The season has been very backward at Montreal and the lumber trade has opened up practically a month later than in some former years. It is still difficult to form an accurate idea of either prices or prospective markets, as trade has not yet settled down. Dealers, however, are generally of the opinion that conditions indicate a healthy market. There has been an excellent demand for shingles, particularly for the best grades. Common grades. however, are too plentiful. The building situation is rapidly improving, and is expected to make a great difference in the demand for all wood goods. The demand for birch from eastern United States points is excellent. An indication of the price situation is afforded by the estimate of a well informed dealer who states that all kinds of timber are now worth from $1.50 to $3 per thousand more than at this time last year. There is a good demand for No. 3 dry lath.

The indications for getting out logs in New Brunswick this spring are at present favorable. Recent reports from St. John river points are to the effect that early in the present month, the river commenced to rise rapidly. Prices of logs at Springhill were quoted at $10.50 to $13.50 for spruce bank logs, and $8.50 for hemlock. The demand for hemlock logs was light. The demand for hardwood was very dull.

The market for eastern spruce at Boston is scarcely as firm as it was a fortnight ago. Summer mills are starting with enough orders on hand to take care of their production for some time. There is an improved demand for random and prices are fairly firm. The demand for hemlock, at Boston, is rather limited, but prices are firm. Eastern clipped boards are quoted generally at $19.50. Hardwoods at Boston are fairly firm. The demand is best for inch plain oak, ones and twos. Quartered oak is moving in small lots with prices slightly easier. Trade is in fair demand for maple and birch and prices are steady.

At New York the demand for eastern spruce is fair but the yards are not as active as they should be at this season. The hardwood situation is stronger at New York than other lines. The best that can be said of it, however, is that it is holding its own. The demand for hemlock is improving slowly, but is still comparatively small for this season of the year. There is a better demand for shingles at Boston and some manufacturers are asking $3.60 for the best cedar extras. The highest price, as a rule, however, is $3.50. Clears are firmer. Prices of 1⅝-inch lath range from $3.70 to $3.75, and for -¼-inch from $3.45 to $3.50.

Western Canada.

Reports from British Columbia are to the effect that trade conditions are healthy and encouraging, with a strong demand. Orders from the prairies are coming forward in fair volume. Shingles are reported quiet, but manufacturers are firm in their prices and are waiting patiently for the eastern trade to open up. Logs are a little lower in price, particularly the lower grades. The logs scaled during the month of March totalled 65,000,000 feet. Merchantable camp run of fir logs are quoted at $8.50 to $9 and common as low as $6. Cedar logs are quoted at $8 to $8.50.

A conspicuous feature of the past month or two has been the quantity of lumber which has been brought from across the line and marketed at prairie points. This quantity has been considerably in excess of that imported during the same period last year. A fact of equal significance has been the expressed intention of a number of manufacturers to branch out into the retail business. It is quite probable that the latter circumstance had an important connection with the former. At a meeting held recently at Winnipeg by a number of representatives of both the wholesale and retail ends of the business these matters were fully discussed. It is probable that some understanding will be reached that will make material changes in the aspect of conditions mentioned.

There have been few changes in prices that might be described as important. Competition, even with the increasing territory and demand, is very keen in all the larger cities and in most of the smaller towns.

Great Britain.

The timber trade at London is all agog over the expected demand on account of the coronation. Importers and merchants are reported to be waiting open-mouthed for the orders which must come into the market for this purpose. At the last coronation something like 14,000 standards of timber were used for coronation stands, fencing, etc. The extreme caution which is characteristic of trade to-day, however, will probably prevent anything in the way of speculation.

At Liverpool there has been a fair improvement in the demand for spot good. Inquiries have become more numerous and prices are steadily held. No important changes are reported in the c.i.f. quotations. Inquiries for future shipments are more numerous both for soft woods and hardwoods. Pitchpine timber c.i.f. values remain steady, but business in future shipments is very limited. A firm tone prevails in the c.i.f. market for spruce. Liner shipments have been sold readily at recent quotations, and new arrivals of this nature are inquired for frequently. Cargo sales, however, are still absent. There is a fair consumptive demand at Liverpool for all sizes of deals and scantlings, and most of the recent arrivals have gone direct into consumption.

The values of birch timber continue very steady with a good demand. Arrivals of Quebec birch have become more numerous, but importers have been able to dispose of it before its arrival. A good inquiry prevails for hardwood planks. Prices continue very firm. The demand for white floorings is rather dull.

The trade at Manchester is not very lively. Some explain this by the numerous failures and rumors of failures among the business trade. The timber trade, however, is just about normal for this time of year.

United States.

Reports from the United States generally, indicate that the lumber trade is doing fairly well. An occasional report states that conditions are not quite as buoyant as might be expected, but on the whole there is a moderate and steady improvement. Most of the wood consuming industries are busy and the demand for lumber, on account of the building activity, is steadily growing. Retail yards are rather low in stock, and dry lumber at mill points is scarce. The result is that shipments are necessary to meet the current demand for consumption and this is keeping considerable life in the trade. The trade in northern pine is progressing, in keeping with the general improvement. Stocks of good lumber are not plentiful and prices, therefore, are well maintained. The weakest feature in the trade seems to be the box businss, although at Lake Erie points an increase in the box business is reported. At the Tonawandas, trade is improving as the season advances. Minneapolis markets are steady and unchanged.

Receipts of lumber at Chicago for the week ending April 29th amounted to 35,813,000 feet, as against 54,990,000 feet for the corresponding week of 1910. The total receipts from Jan. 1 to April 29th were 574,368,000 feet, which is a decrease of 208,903,000 feet, as compared with the corresponding period of last year. The shipments from Chicago for the week ending April 29 were 15,725,000 feet, as against 23,893,000 feet for the corresponding week of last year. The total shipments from Jan. 1 to April 29 were 245,620,000 feet, a decrease of 83,901,000 feet, as compared with the corresponding period of 1910. The receipts and shipments of singles are larger than those of last year. The demand for northern pine lumber is quite strong, and prices are firm. The cheaper grades are moving better, and prices are fairly firm. The market in hardwoods at Chicago continues firm

and is expected to remain so for some time. Hemlock is a little off, so far as demand is concerned at Chicago, but prices are held firmly. A good trade is expected during the month of June. The demand for southern pine has not been very strong at Chicago during the last fortnight, but stocks are moving moderately well, prices still seem inclined to improve. Red cedar shingles continue weak, selling at $3.12 for clears, $2.59 for stars. There is a better demand for white cedar shingles than for red, and the upper grades are scarce. Lath are firm and unchanged. The cooperage situation at Chicago shows no alteration. It is in a waiting state.

At Buffalo, numerous orders have been secured for white pine during the past fortnight, the demand coming largely from the building trade. The demand for pattern lumber is not quite so good as usual. The better grades of stock remain high in price, and scarce. The box business is improving gradually. Buffalo yards are expected to add to their stocks in the near future. Eastern spruce is in some demand for boxes at Niagara Falls. There is a general expectation that if the reciprocity measure is passed, a large increase will take place in the imports of spruce from Canada. A fair trade in hardwoods is in progress at Buffalo, particularly in plain oak, maple and birch. Stocks are scarce, and prices are firm. Quartered oak is inclined to be easier. Chestnut and ash are in fair demand and steady; elm and basswood are quiet. The demand for hemlock, at Buffalo, is improving, but prices are unchanged, as a result of liberal receipts of stock. A lot of western pine is reaching Buffalo from Idaho, and points further west, the grades being shop and better. This sells at a fairly low price, and competes readily with other pines. Southern pine at Buffalo is firmer and the trade is increasing. Shingle quotations at Buffalo are low with frequent fluctuations in price. Stocks, however, are not too plentiful.

Market Correspondence

Improved Prices at Montreal

Montreal, May 8.—After calling on a number of lumber merchants in this city your correspondent has formed the opinion that there are two classes of people engaged in this trade—optimists and pessimists. Certainly the season has been very backward and business has opened up almost a month later than in some years. Prices have not yet become settled and it is very hard to form a fairly correct idea of the probable demands. On the whole, the market seems to be in a healthy condition and the dealers seem to agree that the season is a promising one. At the same time there is great diversity of opinion on the existing conditions. For instance: One dealer speaking of shingles remarked that there had been a great demand for "clears," and that there were practically none left on this market, whereas another dealer said he could supply his confrere with probably all he would want. There is no doubt, however, that the demand in this line has been unusually active. Again, a dealer in a position to be exceptionally well posted, stated that while the best grades were scarce and high priced, the market was fairly glutted with the common grades that were hard to work off. Building operations were now in full swing which would help to clear off the low grades, but they would have to be disposed of at only a small profit. Another dealer found the market in rather better condition from his point of view. Many inquiries were being received from the Eastern States, particularly with regard to red pine and high grade white pine deals. The Americans are also after Canadian birch. This merchant expressed the opinion that if reciprocity goes through, as the Americans appear to think it will, there will be a boom in low ends. Speaking of the English market, the same gentleman said that the head of the firm, who is now on the other side of the ocean, sends over very favorable reports as to the prospects for trade with England this summer.

A firm of manufacturers who prepare wood products from their own limits both for the Canadian and export trades report a good share of orders already on their books and excellent prospects coming from representatives wherever they are doing business. Exceedingly good offers have been received for birch, but still better are expected and this firm are holding their stock for the prospective rise. A representative of the firm said that exporters had every reason to be happy whether their market was in England or the United States.

That lumber in the better grades, of all kinds, is worth from $1.50 to $3 per thousand more than last year was the opinion of one large dealer. He also reported a heavy demand from the United States for cedar shingles, pine and spruce. The shingles come mostly from New Brunswick. No. 3 lath, dry, is now bringing a very high price, there having been an unusually brisk demand for this line, and it will probably be July before the local stock can be replenished from the mills. Lumber in considerable quantities is now arriving in Montreal by barges both from the Upper St. Lawrence and Ottawa rivers, and the Lower St. Lawrence.

The Tourville Lumber Mills Company have received their first shipment of pine and spruce from their Louisville mills. These mills and limits are at Mont-Laurier, 35 miles of Nominingue. The first barge load consisted of a million and a half feet and arrived in excellent condition. The company expect to turn out this season from nine to ten million feet of spruce and two million feet of birch. They are adding an important extension to their plant, including dressing machines, which will enable them to supply mixed shipments to the trade. They will have facilities for producing 50,000 feet per day, and with the good prices now offered both for spruce and birch they are looking forward to an unusually good season. Mr. L. Villeneuve is the president of this company and Mr. Beaupre is the manager.

Canadian Wood in United Kingdom

Liverpool, May 2.—Business in the second and third weeks of April was interrupted by the Easter holiday. In the timber trade the holiday caused a slowing down for a day or two before Good Friday, and a rather lethargic working up to normal activity again, through the two or three days which followed Easter Monday. Business in Canadian timber, apart from this broken holiday period, has been fairly active. At London a good spot demand has been experienced for Canadian spruce and for deals and battens, prices being very firm, with a tendency to advance. Yard stocks continue to move steadily, boards of good quality in yellow pine or spruce meeting with a ready sale. Boards 1-inch thick, from the saw, may be taken as a trade standard, and are largely used in all parts of the Kingdom. Joiners are always glad to get hold of clean and sound inch or 7/8-inch boards and frequently lament that the best stuff procurable does not come up to their expectations. Clean and sound boards of first quality and of any useful length, and of any width from 9 inches, sell well. Boards nominally one-inch thick, of second quality, if good, also sell well, and are used for medium class deal furniture and for house fittings. Third quality yellow pine has a fair and steady sale. Much wood of this kind is now being used for the cheapest deal furniture and for fittings of small cottage property. Yellow pine boards of nominal 3/4-inch cut, also sell well, practically all over the country. In this as in the inch boards first quality wood is called for chiefly, and of this, any lengths above six feet and of widths from nine inches, are useful.

Spruce boards of 7/8-inch and 5/8-inch "down" come in for different uses and for these there is a steady demand. Flooring case making and sheathing purposes make the largest demand for the 7/8-inch wood, and sheathing for the 5/8-inch wood. This thinner wood and all white wood of the soft and non-fancy class, 5/8-inch thick, falls into the class of match-boarding, and of this, a large amount is used for sheathing or "boarding-up" purposes of a temporary kind.

As the event which will make the greatest demand in London, which there is likely to be for a long time, and for a temporary use, the coming coronation stands out conspicuously. Anticipation among timber merchants and dealers has become a wild excitement and estimates are being freely made as to the extent of the demand for timber on coronation account. For the "great" coronation, the coronation as at first arranged in 1902 for the late King Edward, but which had to be postponed, it is said that 14,000 standards of wood of all kinds were used. For that event the "route thoroughfares" of the city seemed to be faced-up with timber, which, in turn, was completely hidden by gorgeous drapings. It is hardly likely that the constructional work for the coming coronation will be carried to an extent equal to that of that memorable preparation. A great deal of work of the kind will, however, be done, and the prospect of having to provide the timber and much of it a very short time before the event, causes some excitement in the trade. Merchants and dealers are trying to "make sure of the stuff"; to be able, that is to say, to put their hands on as much timber of the required kinds as they will want within a fortnight or three weeks of the date of the coronation. For the work, planks, scanting and 7/8-inch boards will probably be most in demand, though a fair quantity of lighter log-stuff will be taken for main, uprights and cross beams. The boards, tongued and grooved, and planed on one side, will be used to "boardup" the back and in some cases the ends of the stands, and to roof the structures over as a protection from sun or rain.

The demand for flooring boards at London has been quiet. The building trade continues quiet so that the consumption of builders' timber is still comparatively small. Matchings, as offered for sale by auction, have found ready buyers. Some 75,000 pieces were sold without reserve in a recent sale, the clearance, no doubt, having a prospective connection with the coronation.

At Liverpool, a fairly satisfactory consumption of spruce is in progress, the output from stocks being in excess of the recent importation. The liner service for the season between Liverpool and the principal Canadian ports has been resumed, and the early supplementing of stocks by liner parcels is now being counted on. New Brunswick spruce deals have been in steady demand. Quebec yellow pine deals have had a moderate sale. In pitch pine the demand for sawn wood

keeps up satisfactorily and planks have had a good and steady sale. Hewn wood has been in but little request. Birch continues in small supply and lumber and planks are in good demand. Planks are in a strong position and holders are very firm as regards prices.

At Manchester, the consumption of Quebec board pine has been on a fair scale, and stocks are much reduced. Spruce deals have had a moderate sale, and stocks of these are also small. Birch logs and planks have been in good demand but stocks of planks are now exhausted. Stocks of logs are small, but would serve for about three months at the present rate of consumption.

At Glasgow, an improved demand for soft and hard wood exists. Quebec pine has been more inquired for and stocks in importers' hands are now very light. Yellow board pine for joiners' uses has sold more freely. At date a very fair all round demand for yellow pine and for spruce exists.

Paving Blocks.—The use of wood blocks for street paving continues to be uncertain and irregular owing to the different opinions as to the value of such blocks in comparison with the newer forms of paving. In London, especially, the newer forms of asphalt roadway are competing strongly with wood, while in provincial cities special local considerations affecting traffic operate against wood, so that no general adoption of wood has taken place, though a good deal of experimenting with wood paving has been done. The usual course has been to pave selected streets, or parts of such streets, with wood blocks and to note carefully all data respecting the area so paved. First cost, wear of surface, general condition of surface as regards wetness, dryness, foothold for horses and for pedestrians, and duration, are the chief points which have been noted. The results have varied greatly, so that county and municipal authorities have not been able to come to any common opinion as to the merits of wood as a material for paving roadways on which a heavy mixed traffic goes on daily. Wood continues, however, to be used for paving, by one authority and another, and when an order for wood blocks for paving is placed, the quantity of blocks called for is usually large. Two orders of the kind are at the moment interesting merchants who supply wood blocks for paving. One of the orders or contracts in question has been secured by J. B. Lee & Company, Limited, and is for a supply of creosoted blocks for the Marylebone vestry, London. The quantity required will, it is stated, work out at nearly two million blocks and will cut up nearly 1,000 standards of 3 x 9 deal. The other order will, it is understood, be given out by the local authorities of Newport, Mon., shortly, as they have just received tenders for a supply of 100,000 creosoted deal paving blocks. Orders of the kind, though not numerous, are a consideration to the trade, and are appreciated when forthcoming.

Census Points.—A "Census of Production" which has been issued as a blue book, contains information bearing on the woodworking industry of the United Kingdom which will prove of interest to those who are engaged in the main branches of the industry. The value of the gross output of timber factories and workshops is returned as £16,166,000. The value of the products of the main branches of timber working, other than the factories and workshops, is given as follows: Furniture and house furnishing and upholstery, £17,969,000; wooden crates, boxes and cases, £2,942,000; carriages, carts and wagons, £5,057,000; brushes, £1,802,000; coopering, £1,115,000; basket and wicker work, £426,000. The sum of these items is £45,477,000. The net output is given as £21,097,000, and the number of persons employed in woodworking 324,063. Most interest will be found in the particulars of some of the sub-divisions which are given. For example, value of the general and jobbing carpentry and joinery work is given as £681,000, yet this is exceeded by the value of the "wood-turnery of all kinds. This is given as £900,000. The value of crates, cases and boxes produced is given as £714,000. The value of the coffins made, as £185,000. A total which will cause surprise is that for "firewood, shavings, sawdust, etc." The value of these products for the industry is given as £371,000. The value of flooring and paving blocks is returned as £313,000. Probably the most interesting item of the whole is that of the value of the "firewood, shavings, sawdust, etc." This is of especial interest as showing how the oddments and refuse of the manufacture are turned to account, and represents a value in excess of that of some of the manufactured products of the industry, such as coffins and paving blocks. The cost of creosoting is returned at £57,000; of planing and moulding, at £45,000; of carving and fret cutting, at £12,000, and of veneer saw and knife cutting, at £10,000.

Cash vs. Credit.—Another attempt is being made to place the terms of payment in the timber trade on a satisfactory basis. For some years past practice, in the matter of paying for timber, has been growing more and more lax, as regards the date of payment for goods bought, until, at the present time, unreasonably long periods of credit are taken by buyers. Importers and merchants are anxious to meet the convenience of buyers to the fullest possible extent, and acting in this spirit, have frequently taken payments at long dates. This has become known and the good nature of importers and merchants has been abused. Representations on the subject have lately been made to the committee of the Timber Trade Federation, and it has been decided to bring the question of the terms of payment in the trade before the members of the Federation. A meeting is to be held at an early date at which the subject is to be discussed, with a view to some understanding being arrived at with respect to terms of payment in the trade, which may be adopted by the trade throughout the country.

The Cutting of Prices.—Another topic, cognate to that of long-deferred payments, is also occupying the atention of many members of the timber trade at the present time. This is the old topic of "cutting" prices. The practice of cutting is if anything more irritating to the great body of members of the trade than that of taking undue credit, as it is sometimes carried to the extent of cutting-out profit altogether. It is admitted that the "cutter" is the depression of prices and that a few cutters, operating at the same time, may bring a whole trade into a serious financial position. Cutting has lately been very prevalent, and an outcry has arisen against it. The practice is not confined to the timber trade. Other trades have been wrestling with the problem of how to put a stop to cutting, but so far the steps taken to that end have not proved effective in putting a complete stop to the practice. In some cases the practice has been checked and kept within narrower limits, and this appears to be as much as can be looked for. Trade associations have affirmed and re-affirmed their views and wishes on the subject, and in some trades attempts have been made to form agreements under written bonds, carrying penalties for non-fulfilment, by which the "supplies" of goods to known "cutters" might be stopped and their cutting be brought to an end, through a lack of goods to sell. This plan has, however, generally broken down within a very few weeks of its first introduction. It has been found that there are always "first hand" traders who are ready to sell goods to merchants who come, cash in hand, to buy, and that there are always merchants who are ready to sell to smaller merchants or dealers who similarly come cash in hand to purchase, irrespective of whether the buyer in either case be a "cutter." Contract notes and sale-note clauses without end have been drafted in order to stop "cutting," by stopping the cutter's supplies, if needs be. Almost invariably it has been found that a cash buyer, whether cutter or not, can get all the stuff he wants, and the question has been thrown back on the corporate influence of the trade. If the Federation will speak clearly and decisively on the subject, and the members of the Federation and of provincial timber trade associations be asked to pledge themselves to stand loyally by the Federation's ruling and to use their influence individually to secure the observance of that ruling, little else can be done. The great majority of members of the trade would be true to bond and word. The others—well, the loyal members would know that these odd-men-out, were not loyal, and could act in relation to the knowledge as they thought best in the interests of the trade. The need of the hour is for the Federation and the provincial associations to speak authoritatively on the case, and to affirm or re-affirm what they regard as the rule of the trade, and for the trade to be asked as a whole and to a man to accept and observe the ruling loyally and continually, whatever anyone else may do.

United States Lumber Trade with Canada

During the month of March, 1911, United States imports of wood and manufactures of wood amounted in value to $3,374,252. In the corresponding month of 1910 the total was $3,959,796. There was, therefore, a decrease in the imports for 1911 of nearly $600,000. For the nine months ending March, 1911, the total value of imports of wood and manufactures of wood was $40,570,318. For the nine months ending March, 1910, the total was $41,288,485, and for the nine months ending March, 1909, the total was $32,773,285. There was, therefore, a decrease during the nine months ending March, 1911, to about $700,000, as compared with 1910, and an increase of nearly $8,000,000, as compared with the nine months ending March, 1909. Of these totals, the imports of boards, planks, deals and other sawed lumber from Canada during March, 1911, were valued at $591,667, and during March, 1910, the value was $1,058,251. There was, therefore, a decrease of almost 50 per cent. in these imports. For the nine months ending March, 1911, the imports of boards, planks, etc., from Canada amounted in value to $12,384,252, as compared with $14,782,719, in the nine months ending March, 1910, and $11,987,832 in the nine months ending March, 1909. There was, therefore, a decrease for the 1911 perior of nearly $2,500,000, as compared with 1910 and an increase of about $400,000, as compared with the 1909 period. The imports of laths showed a rather similar decline, being for March, 1911, $49,684, and for March, 1910, $106,770. For the nine months ending March, 1911, the imports of laths were valued at $1,249,592, as compared with $1,401,328 for the corresponding period a year ago. The imports of shingles for March, 1911, were valued at $76,300, as compared with $113,316 in March, 1910. For the nine months ending March, 1911, the imports of shingles were valued at $1,008,645, as compared with $1,357,486 for the nine months ending March, 1910, and $1,869,083 for the nine months ending March, 1909. The imports of wood pulp from Canada for the nine months were valued at $4,206,434, as compared with $3,374,311 for the 9 months ending March, 1910, and $2,650,297 for the nine months ending March, 1909.

We are open to contract for the output of our present season's cut of

Norway and White Pine Logs

Stocks will be sawn at Biscotasing, Ont., C.P.R. main line and at Spanish (Georgian Bay).

TALK NO. V.

It is absurdly easy

to make a lot of fine resounding assertions about the "AMPHIBIA" Water Proof Belt. Any man with an extensive vocabulary could do that about any weak-knee'd proposition.

But we're out to convince you, so here's a definite offer.

We will send to any responsible firm

ONE "AMPHIBIA" BELT

on trial and if it fails to do as we state, it can be returned and no charge will be made.

Now, advertisers sometimes make offers which have a nice open-handed appearance, but which it would'nt pay them to get accepted.

But our offer, as outlined above, has been accepted and

Not one belt has come back

One customer says that it lasts five times as long as any other belt he has ever used.

Enough to make you think, eh ?

Remember, "AMPHIBIA" is waterproof and made from first-class oak leather.

The March imports of wood pulp were valued at $368,336 in 1911, and $417,580 in 1910.

The United States exports of wood and manufactures of wood, including furniture, for the month of March, 1911, were valued at $8,281,027, as compared with $7,158,743 during March, 1910. For the nine months' period the total value was $65,311,808 in 1911; $54,972,961, in 1910; and $48,548,818, in 1909. There has, therefore, been a steady and substantial increase in these exports during the last two years. Exports of timber hewn and sawed, to Canada during the month of March, 1911, were valued at $138,245, as compared with $124,450 in 1910. For the nine months' period the total was $1,189,639 in 1911; $968,920 in 1910, and $789,319 in 1909. Exports of boards, planks, deals, etc., to Canada during the month of March were valued at $781,035 in 1911, and $573,872 in 1910. For the nine months' period the total value was $6,400,932 in 1911, $3,235,681 in 1910, and $2,193,204 in 1909. Exports of staves and heading to Canada showed large increases.

Alien Labor in B. C. Camps

That serious breaches of the law regulating and restricting the employment of certain classes of labor in timber camps throughout British Columbia are being made was stated to Premier McBride by Mr. Murray S. Potts, president of the United Brotherhood of America, and Mr. Horace J. Robinson, secretary-treasurer of that organization, who waited upon the Prime Minister recently as a delegation from the brotherhood, which is more generally known as the Loggers' Union.

Briefly, the charges formulated by President Potts were to the effect that the low is being constantly violated in three important respects, viz., the employment in timber camps on leasehold and licensehold lands, of Chinese and other Orientals, that engineers other than those properly certificated are being employed in numerous camps and that some few camps in the northerly coast district are importing and employing men in direct contravention of the Alien Contract Labor laws.

Mr. Michael Manson, M.P.P. for Comox, who introduced the delegation, pointed out that the charges formulated touched upon a very serious matter in the coast districts, particularly in view of the fact that many men are at present out of employment in the province who might legitimately and advantageously be engaged in the lumber camps.

President Potts was assured by the Premier that the matters complained of would obtain the immediate attention of the government.

A Fire Proof Roofing Material

In the year 1889 the fire loss in the United States totalled $123,046,833. Ten years later it amounted to $153,597,830. Last year $204,000,000 worth of property was destroyed by fire. This constantly increasing annual fire loss has induced engineers interested in fire protection to seek for all practical methods of lessening the danger of ignition and spread of flames. As a result, tile, vitrified facings, terra cotta, concrete construction and numerous other fire-resisting materials have been developed for use in all parts of buildings except the roof while but few important improvements have been made in roofing materials, notwithstanding the fact that authorities claim that from 27 per cent. to 50 per cent. of the conflagrations are the result of flames being communicated to adjoining buildings by burning sparks and embers falling on an inflammable roof.

Factories, barns, etc., are probably more at the mercy of burning sparks and embers than other types of buildings, because they are usually covered with so-called ready roofings, and nearly all roofings of this type are made of wool felt, rag stock, paper, coal tar and other highly inflammable materials. There is one roofing, however, known as J-M Asbestos Roofing, which is being largely used on factories and large buildings, and which seems to overcome the objections to all others of this type. It is said to be so fireproof that it will withstand the flame of a blow-torch for an hour without being injured. This roofing is made by the H. W. Johns-Manville Company, of New York, well known as manufacturers of asbestos products.

This roofing is made of asbestos (a stone) and Trinidad lake asphalt (a mineral). The asbestos rock when it comes from the mines is in appearance much the same as other rock. When scientifically crushed, this rock produces long, tough fibres which are woven into cloth for asbestos theatre curtains, made into sheets of felt for roofing, and treated in various ways for making hundreds of different fireproofing materials.

In making this roofing, several sheets of this asbestos felt are thoroughly saturated with Trinidad lake asphalt, well known as a permanent waterproofing material. These sheets are cemented firmly together with the asphalt, making one homogeneous mass. This provides an actual covering of stone, which, because of its all-mineral nature, not only offers to a building protection against fire, water, wind and weather, but which also naturally cannot rot, rust, melt, run or crack, and requires no painting to preserve it.

A copy of the company's handsomely illustrated catalogue will be gladly sent by them to any of our readers inquiring for it.

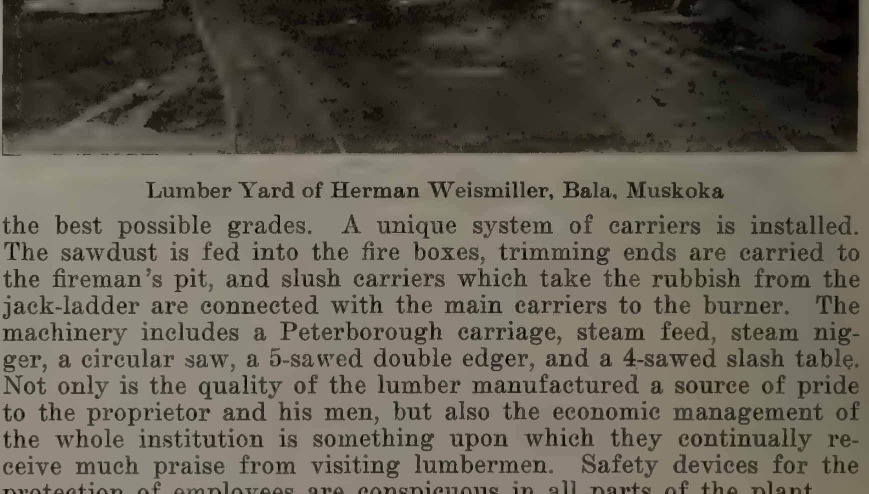
A Model Saw Mill at Bala, Muskoka

Business Methods Which Have Made a Good Reputation for Product of H. Weismiller's Plant

A pioneer settler in the district of Muskoka, Ont., who was well known to the lumber trade for many years was Henry Weismiller, who opened a small lumber mill about 1880. He made an excellent name for himself and for the lumber which was turned out under his superintendence, and he gave to Canada five sons, all of whom are now interested in the sawmilling industry in various parts of Canada. One of the best known of these is Herman Weismiller, a young and prosperous lumber manufacturer operating at Bala, in Muskoka, and also at Germania, near Gravenhurst. The Germania mill saws from 15,000 to 18,000 feet daily during the winter. The mill at Bala has a capacity of 25,000 to 30,000 feet per day. It was built in 1907 and faces Musquosh Bay, on the Musquosh river, which connects the Muskoka lakes with Georgian bay. The illustrations accompanying this article represent the mill, and the lumber yard

Saw Mill of Herman Weismiller, Bala, Muskoka.

Mr. Herman Weismiller's Bala plant, although not of great proportions, is operated upon the most modern and businesslike methods. There are three tracks in the yard, which connect with the Toronto and Sudbury line of the C.P.R. In the mill and yard, employment is found for 25 men. The mill is run by steam, from two boilers, which develop 80 horse power. Everything possible is done in the mill to economize in the cost of operation and to produce lumber of the best possible grades. A unique system of carriers is installed. The sawdust is fed into the fire boxes, trimming ends are carried to the fireman's pit, and slush carriers which take the rubbish from the jack-ladder are connected with the main carriers to the burner. The machinery includes a Peterborough carriage, steam feed, steam nigger, a circular saw, a 5-sawed double edger, and a 4-sawed slash table. Not only is the quality of the lumber manufactured a source of pride to the proprietor and his men, but also the economic management of the whole institution is something upon which they continually receive much praise from visiting lumbermen. Safety devices for the protection of employees are conspicuous in all parts of the plant.



Lumber Yard of Herman Weismiller, Bala, Muskoka

It is needless to say in view of the very practical and thorough manner in which the plant is equipped that Mr. Weismiller's product is sought after by all good judges of lumber, who buy in the Georgian Bay district. Mr. Weismiller is a sample of that excellent type of successful Canadian lumbermen who have done so much for the development of the industry, and he well deserves the English pronunciation (wise miller) of his Teutonic name.

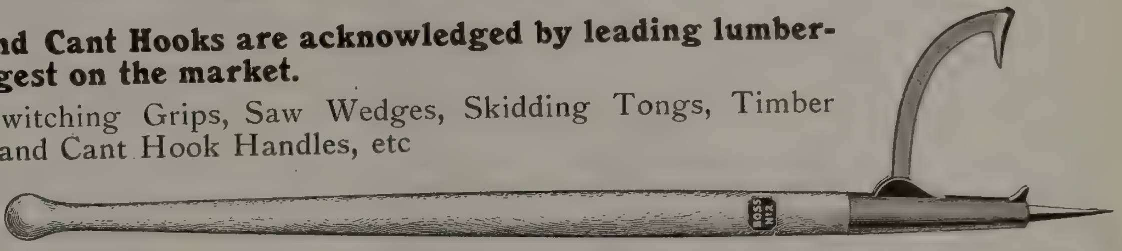
Boss Line Lumbering Tools

Manufactured by

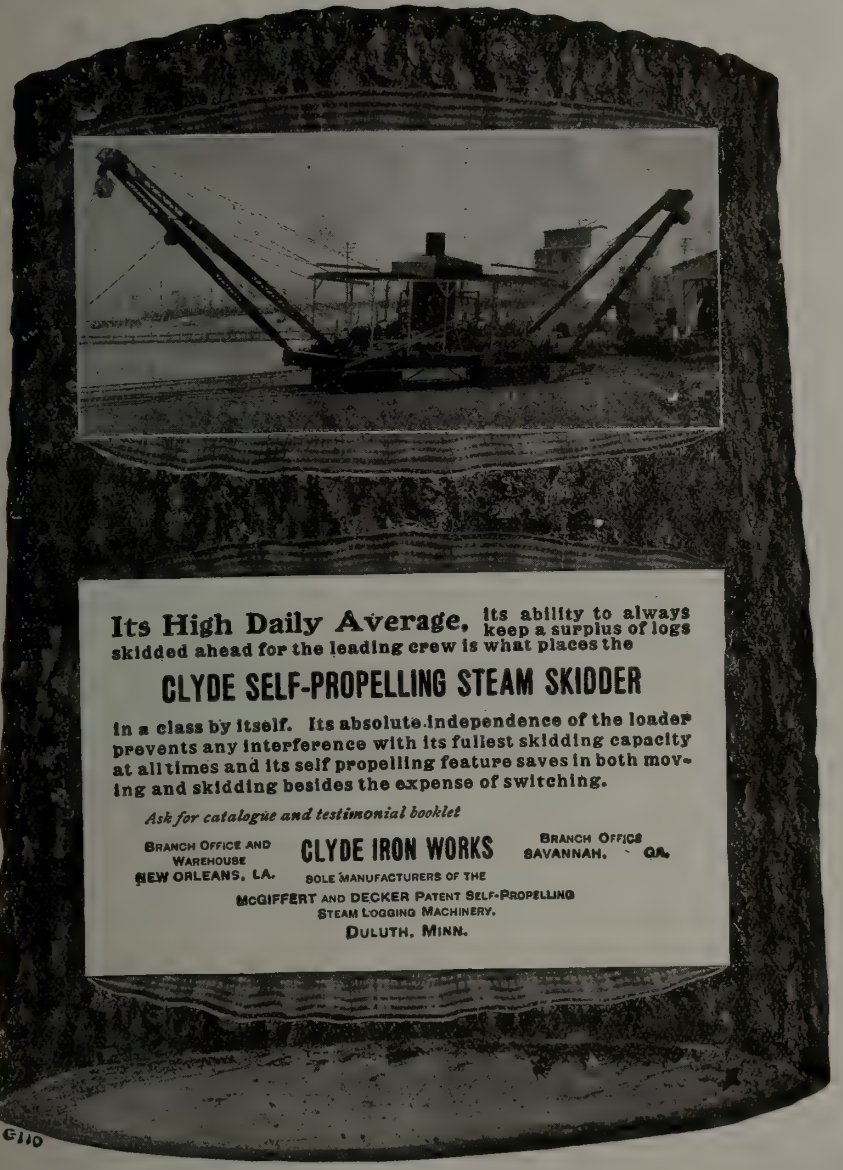
The McFarlane-Neill Mfg. Co., Ltd., St. Mary's, N. B

Forged Steel Socket Peaveys and Cant Hooks are acknowledged by leading lumbermen to be the lightest and strongest on the market.

Try our Steel Loading Blocks, Twitching Grips, Saw Wedges, Skidding Tongs, Timber Carriers, Split Rock Maple Peavey and Cant Hook Handles, etc



Catalogues furnished and prices quoted on application



Its High Daily Average, its ability to always keep a surplus of logs skidded ahead for the leading crew is what places the

CLYDE SELF-PROPELLING STEAM SKIDDER

in a class by itself. Its absolute independence of the loader prevents any interference with its fullest skidding capacity at all times and its self propelling feature saves in both moving and skidding besides the expense of switching.

EDGINGS

Ontario

The sawmills of Gillies Bros., Limited, at Braeside, Ont., started sawing for the season early this month.

It is announced that the W. C. Edwards Company have purchased five acres in the vicinity of Westboro, where they will erect a branch planing mill.

Mr. Jack McRae, contractor, Port Arthur, Ont., will double the capacity of his plant so as to include the manufacture of hardwood flooring, sashes and doors.

The Toronto Lumber Company, Limited, Toronto, capital $40,000, has been incorporated. The incorporators are: H. B. Bishopric, merchant; T. B. Scott, merchant, both of Toronto.

The Baden Lumber & Manufacturing Company, Limited, Baden, Ont., has been incorporated with capital of $20,000. The incorporators are: D. G. Steinmann and Henry Ratz, laborers, both of Baden.

Port Arthur, Ont., has signed an agreement with W. B. McArthur of Deseronto, for the establishment of a match factory to be started shortly, and be in operation by December 1st, with 60 hands.

Mr. Thomas Gardiner, a former resident of Galt, Ont., has purchased from his brother, Mr. P. W. Gardiner, the lumber yards on both sides of Ainslie street in that city. They will carry a full line of lumber for the building trade requirements.

The new firm of Hall & Utting, on George street, Galt, Ont., will build a two-storey addition 60 x 40 feet, to their cabinet and planing mill. The building will be constructed of reinforced concrete and part of it will be used for a new drying kiln.

A temporary sawmill is being established near the Renfrew Planing Mill, Renfrew, Ont., to convert into sawn lumber the 15,000 logs hauled in from the Carswell section during the winter. The bandsaw will be brought in from the O'Brien mill at Calabogie.

The controlling stock of the St. Clair Construction Company, Limited, Davenport Road, Toronto, has been purchased by Firstbrook Bros., the well known box manufacturers of Toronto. The business will be continued as usual with Mr. A. H. Macabe remaining in charge as manager.

A serious fire occurred at the Baker Lumber Company's yard, Lindsay, Ont., on May 6th, by which over a quarter of a million feet of beech and hemlock lumber and half a million shingles were destroyed. A G.T.R. car filled with shingles was also destroyed. The fire is supposed to have started from a spark from a passing steamer. The loss is roughly estimated at about $8,000, and is covered by several insurance companies.

The Meaford Manufacturing Company's sawmill at Centreville, Ont., was completely destroyed by fire recently. The machinery was so badly damaged that it is doubtful whether it will be fit for use any longer. No damage was done to the lumber outside. There was an insurance of $800 on the mill and contents, but it is thought the loss wil exceed this amount. The company were thinking of moving the mill to Meaford in the near future, so it is improbable that they will rebuild at Centreville.

Owen Sound, Ont., has carried a number of by-laws providing for loans for three new factories. Among the loans will be one of $25,000 at 4½ per cent., which will be advanvced to the Adams Furniture Company of Toronto. The new factory will manufacture a high class of furniture and upholstered goods. This will be the fourth furniture manufacturing company in Owen Sound, the others being the North American Bent Chair Company, Limited; the National Table Company, Limited; and the National Furniture Company. A similar loan will be made to C. S. Lloyd & Company, of Toronto, who will erect a factory at Owen Sound, for the manufacture of children's carriages and waggons and steel wheels for various kinds of vehicles.

Much anxiety is felt at present in Kenora, Ont., and district owing to the breaking out of fire in the thickly wooded territory surrounding Clearwater Bay, some 16 miles from Kenora on the Lake of the Woods. A big fire was raging in that vicinity at latest reports, especially the southwestern portion, and as there had been but one day of rain to chronicle this season, the outlook was far from promising. Chief Fire Ranger Legris, with several others, left Kenora for the fire belt, and every effort is being put forth to check further ravages. Seven miles out on the lake, near Bar Point, and within a few miles of the Indian reserve, fires were burning, but local efforts were doing much to check them. East of Kenora, between Ignace and Tache, fires prevailed in different sections, and in some places quite close to the main line.

The Union Lumber Company, Limited, is the name of a new wholesale lumber company which is being formed at Toronto. Those interested are W. D. Lummis, Toronto; D. McLaren, of the DeLaplante Lumber Company, Toronto, and C. Wilkinson, formerly of the DeLaplante Lumber Company. The offices of the new company are in room 904 Kent Building, Toronto. Mr. Wilkinson is temporarily in charge. Mr. McLaren who is vice-president of the DeLaplante Lumber Company, will not be actively engaged in conection with the new company at first, but in the near future will devote all his attention to it. Mr. McLaren will be in charge of the office at Toronto. Mr. Wilkinson will be in charge of the buying and selling for the company, and Mr. H. G. McDermid, formerly with the DeLaplante Lumber Company and later with John H. Eyre, of Toronto, will be city salesman. The company wil handle white pine, spruce and hemlock, but will devote most of their attention to white pine.

Eastern Canada

Herbert & Cyr, coal, wood, saw and carding mill, Napierville, Que.; Herbert and Alfred Cyr, have registered.

The sawmill owned by Mr. S. A. LeBlanc at St. Paul, Kent County, N.B., was destroyed by fire recently, and also a large quantity of sawn lumber. There was no insurance on the mill or lumber, and Mr. LeBlanc's loss will be about $3,000. A large number of the people of that vicinity who hauled logs to the mill to be sawed will lose, it is said, from $100 to $200 each. The fire started while the men were at dinner and the mill shut down.

The Canadian Car & Foundry Company's plant at Amherst, N.S., suffered a severe loss by fire recently. The blacksmith shop, forge shop, machine shop and grey iron foundry were destroyed. The loss will aggregate from $150,000 to $200,000, and will temporarily throw 800 men out of employment. The rolling mills, malleable works, axle and wheel shops are not affected and will continue to operate. It is expected that the buildings destroyed will be rebuilt immediately. The insurance on the whole plant amounted to $689,400, of which $100,000 was on the forge and machine shops and their contents.

Mr. A. Cote, timber expert, has just returned from Bersimis, Que. He states that he found valuable timber limits, including 100 miles of heavily timbered lands, consisting of all kinds of valuable timber. He further reports that a river passes through the forest with plenty of water for drives during the whole season.

A Sackville, N.B., report states that if all the lumber cut along the N. B. & P. E. I. road this winter is got to the Cape, there will be more shipped from that port this season than in any previous season. P. G. Mahoney cut in the neighborhood of four million feet on his property at the upper part of the parish; this together with over two million feet carried over from last year, will go to the Cape. The other operators along the line, including J. L. Hicks, Arthur George, W. M. Spence, Silas Hayward, the Messrs. Hickman and others, will swell these figures to perhaps twenty million or more. Black & Sons will ship several million feet from Pointe du Chene, and P. G. Mahoney will ship all his cut at Calhouns from the same port. Mr. Mahoney has had the old mill at Calhouns thoroughly overhauled, and it is now in first class running order. The only thing lumbermen in this part of the province have to fear now is the possibility of their drives being hung up in the streams on account of low water. There was very little snow in the woods, and there was not a single heavy rain this spring, as a consequence all the streams are exceptionally low for this season.

Western Canada

A. Johnstone & Company, Limited, have started a retail lumber business at Amisk, Alberta.

The Fernridge Lumber Company, New Westminster, B.C., have almost completed a new mill in the place of the one that was burned down several weeks ago.

The British Columbia Gazette gives notice of the following incorporations: The New Ladysmith Lumber Company, Limited, Nanaimo, B.C.; capital $400,000. The Contractors' Material Company, Limited, Victoria, B.C., capital $50,000.

The Dominion Sawmills & Lumber, Limited, have moved into their handsome new office building at Nelson, B.C., which was erected at a cost of about $30,000. It is reported that the Company have purchased the timber interests of the Rogers Lumber Company of Okanagan at an estimated value of over $1,000,000.

D. C. Cameron, president and managing director of the Rat Portage Lumber Company, is asking the St. Boniface council for a reasonable assessment on the property within the city limits for a term of 20 years, stating that, if granted, the company would spend a quarter of a million in extensive building, and along industrial and manufacturing lines.

The mill recently purchased by Major Peuchen, of Toronto, from Senator Peter McLaren, at Blairmore, Alberta, will have a large cut this summer. Mr. Donnisthorpe, late of the Macleod office of the company, is in charge of the Blairmore office. Mr. F. T. Mercer, of Toronto, will be manager at Blairmore. The 7,000-acre ranch at Mountain Mill, on which the company will raise horses, for its camp operations, will be in charge of a nephew of Major Peuchen.

E. W. Leeson, of the Skeena Lumber Company, B.C., reports that the present season promises to be one of the most prosperous in the history of the northern country. The canneries always use a large amount of rough lumber, but in addition to the old markets a considerable new market is this year expected on account of the very large influx of people who are certain to come into the district this year. About forty men are at present employed by the Skeena Lumber company.

Hon. Everett J. Lake, of Hartford, Conn., a wealthy lumberman, who has extensive timber properties in British Columbia, recently visited Vancouver. Mr. Lake is president of the Hartford Lumber Company and also owns the controlling interest in the Northwestern Timber Company. Both concerns are heavily interested in British Columbia. The object of his visit was to prepare for the building of a sawmill in Vancouver to handle the output of the timber limits owned by him and his colleagues. The site for the mill has not yet been decided upon. It is the intention of the Hartford Company to build a plant with a capacity of 180,000 feet daily.

Fire broke out in the shingle mill of the Pitt River Lumber Company recently, and within four hours the shingle mill, sawmill and practically the whole of the lumber yard were consumed, with a total loss estimated at $200,000. It is believed that the flames originated from a hot box in the machinery in the shingle mill. There was about 2,000,000 feet of lumber in the yard, while the capacity of the sawmill was 100,000 feet per day and that of the shingle mill 200,000 shingles. Mr. James C. Shields, president of the company, announces that they will erect at once a reinforced concrete mill at a cost of $250,000. The capacity of the mill will be increased. The fire loss was $150,000, with $75,000 insurance.

The British Columbia Lumber Corporation purposes to construct on Lulu Island, just south of Vancouver, on the Fraser river, a saw mill with a 10-hour capacity of 250,000 feet, a box and a sash and door factory. Electricity will be used as motive power. The mill will have two units, one to cut spruce and cedar and the other to cut fir. This company are surveying their 182 square miles of timber limits at Massett inlet, Queen Charlotte islands, and when the Grand Trunk Pacific extension is completed will erect a large sawmill and a pulp mill in the north. This concern recently bought out the Patrick Lumber Company, which had valuable white pine limits on the Slocan river. The timber will be cut into shop and factory lumber for shipment to the United States. It is expected that the mill will be completed by October 1st. Mr. F. L. Buckley is manager.

An Edmonton despatch reports that between 5,000,000 and 7,000,000 feet of lumber will be handled yearly by the mill which is to be installed this summer on his timber limits on the McLeod river, by Theodore A. Burrows, of the T. A. Burrows Lumber Company. Mr. Burrows is one of the largest owners of timber in western Alberta. West of Edmonton, he controls three of the most valuable berths, two or which are close to the Grand Trunk Pacific main line. One of these is on the McLeod river, and the other on the Athabasca river, near Jasper Park, a portion of the berth extending into the park. The third berth is on the Pembina river, and will be directly on the new line of the Canadian Northern Railway to the Peace river country. It is the intention of the Burrows Company to instal mills on their limits as soon as transportation facilities are available. They will have the mill on the McLeod river in operation this summer. A mill will also be put on the Pembina river berth as soon as the C.N.R. have reached the district. It is generally understood that the Canadian Northern will build a big portion of their Peace river line this year.

The Barnhart Log Loader

has been in successful operation in all parts of the country for twenty years and never caused a complaint. We are now manufacturing a new Barnhart Loader known as **Model "12,"** which is specially designed for use in very heavy timber. This loader is built on the same lines as the old Barnhart Loader now known as Model "10" and which we still continue to manufacture. We are operating lumbermen, producing 200,000,000 feet of lumber per annum and we use the Barnhart Loader exclusively. Could we afford to do so if it were not the best? Write us for prices.

Wire Rope

When you need wire rope for any purpose whatever, it will surely pay you to communicate with us.

We have in stock all kinds—in all sizes—in any length.

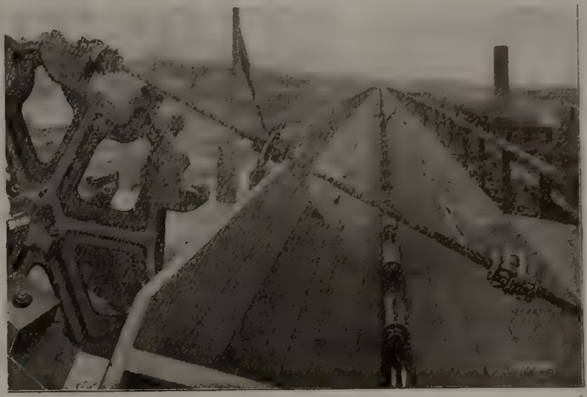
Should your requirements be special—we can make rope to exactly suit your needs. We know how, as we have had years of experience.

Wire Rope Fittings of all Kinds

The Dominion WIRE ROPE Co., Limited
MONTREAL

Jeffrey Wire Rope Conveyers

Are used extensively in the lumber industry



Because

They have greater efficiency and are more economical than other types of conveyers.

They are pre-eminently fitted for medium and long distance haulage; are employed with greater success in handling Lumber, Logs, Refuse, etc.

We have conveyors of this type exceeding 1,000 feet in length which are in successful operation.

Write for Booklet 33

We build Conveying Machinery for all requirements in the Lumber Industry.

The Jeffrey Mfg. Co.
Montreal, Can.

Toronto Office, ———— 174 King Street East

From Halifax, N.S. to Port Alberni, B.C.

OUR

"Electric Test Tempered" Saws

are being used and giving good satisfaction

NOVA SCOTIA

Our method ot tempering guarantees uniformity and toughness.

Our Inserted Tooth Saws are fitted with our patent I.X.L. Bits and Shanks that will not slip sideways.

Guaranteed to cut easy and free and to have no equal in frozen or hardwood timber.

Tools That Build Business

The Way to Get a Good Output

is to have tools with *labor saving and time saving features*—tools that will keep the machines going and the men busy instead of waiting around while repairs or alterations are being made.

You can increase the output of your matcher or moulder besides saving the annoyance of tedious filing to shape and fitting by using Shimer Cutter Heads with Circular Bits, which have the shape turned into them for all time. You can also do away with the old slow way of adjusting cutters when changing from one kind of wood to another, or from dry to partly dry lumber.

The Shimer System of Tools also provides for Interchangeable Heads for making Flooring, Ceiling, Siding, Ship Lap—to joint square edges or to make glue joints—to shape Door and Sash Mouldings. There is no delay while a Head is being fitted up and Bits filed to shape because the Shimer Heads are always ready to use. One style can be slipped off the spindle and another put on in a few second's time.

A tool like the Shimer Cutter Head that is designed and built to be a profitable tool for you to use—that increases your output—that makes the time of your men more productive—is surely a good investment. We prove this to you by our free trial plan.

Pick out the tools you need from this page or from our catalogue and let us have the order at once. You will be surprised at the small amount of money necessary to equip your mill to get a larger and better output.

Matcher Heads—"Best of All"

Figs. 22 and 23 with concave bit seats, without Bits	$24.31
Figs. 202 and 203, with Expansion, $2.60 extra each Head having 4 bit seats.	
Bits for Ceiling, the set of 8....	$10.40
Bits for Flooring, the set of 8..	11.44
Bits for 2 inch Plank, the set of 8	13.04

Jointer Heads

Figs. 54 and 55 ,4 bit seats, each	$20.80
Additional bit seats with bolts, only 65 cents each.	
Jointer Bits 1¼ in. wide, each..	$1.30
Jointer Bits 2 in. wide, each....	1.56

Double Ceiling Heads

These tools double the capacity of a matcher in working ceiling.

Price, 2 Heads with 4 bit seats each	$24.30
Price, Bits extra, 8	16.64

Ship Lap Heads

Figs. 38 and 39, 4 bit seats to each Head, price net	$22.88
Additional bit seats and bolts, only 65 cents extra each.	
Bits for jointing, 4	$5.20
Bits for Rabbeting, 4	6.76

Door Heads

Fig. 82, solid flange	$10.75
Fig. 84, with Expansion	13.35
Bits to work 1 in. to 1¼ Doors, 4	7.28

Door Cope Heads

Fig. 83, upper and lower copes to fit any tenoner (set 2 Heads)	$12.90
Bits extra, 4	5.72

Sash Heads

Fig. 86, solid flange	$9.75
Fig. 206, with Expansion	12.35
Bits extra to work 1 to 1¼ in. Sash (2 Moulded Bits, $4.30; 2 Rabbeting Bits, $2.86)	7.16

Combined Matcher, Ship Lap and Rustic Heads

with Interchangeable Curved Bits—excellent cutting tool, simple and accurate in construction, suited for quick changes.

This is a new tool suited especially for such as wish a variety of Bits to fit uppon the same Head. They work with the alternate, clearance cut having all the advantages found in the Standard Shimer Cutter Heads as regards their cutting quality.

Price, each Head without Bits, net,	$12.60
Bits, each	1.26

Our Beading Attachment

with milled bits applies to any four sided cylinder. It is carefully made to fit into the slot of the head side and fastens firmly the knife and attachment with a single bolt.

Price (2) Attachment with Bits complete, net	$5.20
Extra Bits, each	1.30

Wood Forming Cutters

Our Reversible and One-Way Cutters are superior to anything on the market in design and construction—retain their shape until worn out, and do not friction and burn the lumber. Many useful designs with prices are given in our catalogue . Send for a copy.

Our Bedee Knives, recommended by users as the best thin steel knives on the market, can be furnished in any length or thickness on short notice. Write us about your requirements.

Cutter Head for Matching Reversible Glue Joints

turns out a most satisfactory fitting of the tongue and groove, interlocking from the same piece of matched material, requiring but one Head with Bits to produce. The jointed material will fit together when the pieces are sawed to length by simply turning the one piece end to end.

Glue Joints must depend upon accuracy as well as permanency of pattern. We guarantee both.

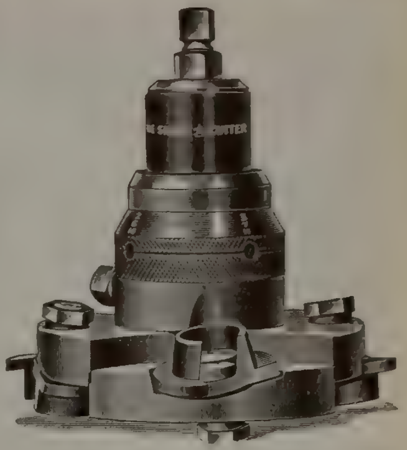
Prices range from $15.54 to $17.30 for a four bit Head, and from $19.96 to $22.60 for a Head with 6 Bits complete.

Bolts, Wrenches, etc.

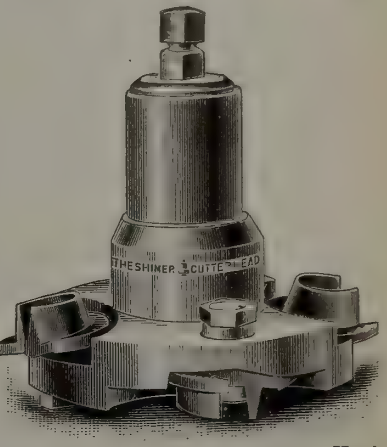
These tools are arranged with Circular Bits and saw spurs for edging up the square shoulder of the groove when cutting across the grain of the wood. The Bits will expand to nearly double the thickness of the narrowest groove they make, and with wider or thicker Circular Bits their range of expansion is readily increased up to 2 in. or more. We make them to fit any saw mandrel, long or short. Price, complete, 8 in. diameter or less, net, $21.45.

Expanding Dado Heads

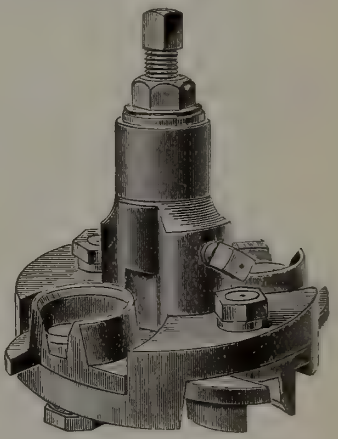
We carry a full stock of supplies and can fill orders promptly for anything in our line, such as Wrenches, Planer Head Bolts, Nuts, Washers, Gauges, Set Screws, Brass Washers for under Bits, etc.



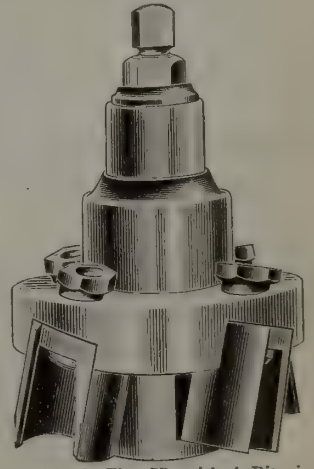
The Best of All, Fig. 203. Groove Head with 4 bit seats, complete, net $24.47. Made also with 6 and 8 Bits to each Head.



The Up-to-Date, Fig. 23. Groove Head with 4 bit seats, complete $17.87. Also made with 6 or 8 Bits to each Head.



Groove Head, Fig. 2. For plain matching of tongue and groove joint, complete with Bits, $13.00.



Jointer Head, Fig. 55, with 4 Bits in line of work. Also made with 6 and 8 Bits to each Head. With 4 Bits $16.64.

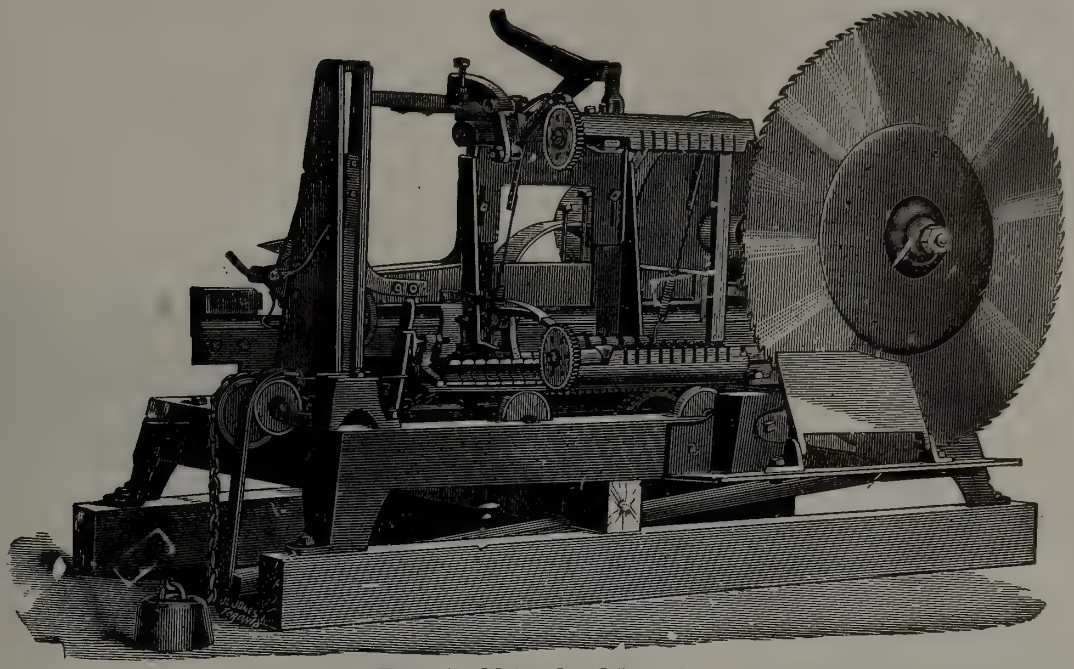
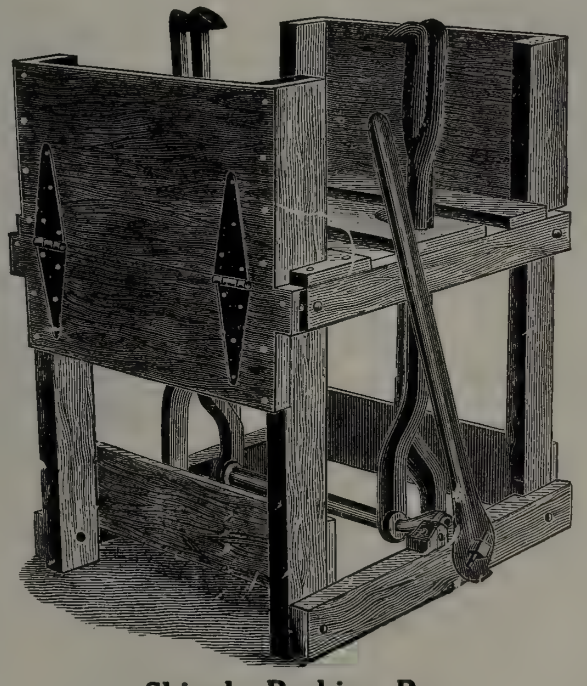
Making and Packing Shingles



"Boss" Shingle Machine

Shingle Machine

It is perfectly automatic in its action. A patent brake relieves the machine of all jar when the carriage is stopped to change blocks. It is altogether the simplest in construction of any machine built, and combines so many advantages that it is far superior to any machine on the market. Write for literature.



Shingle Packing Box

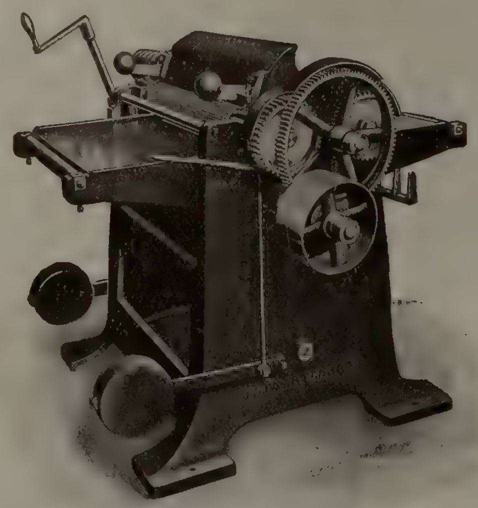
Packing Box

This box is suitable for 16 or 18-inch Shingles and is universally used by shingle manufacturers. The above cut describes it. Simple, handy and the greatest time saver ever brought out as a packing box. Send for literature describing this and our other saw mill machinery.

Two Machines You Cannot Afford to be Without

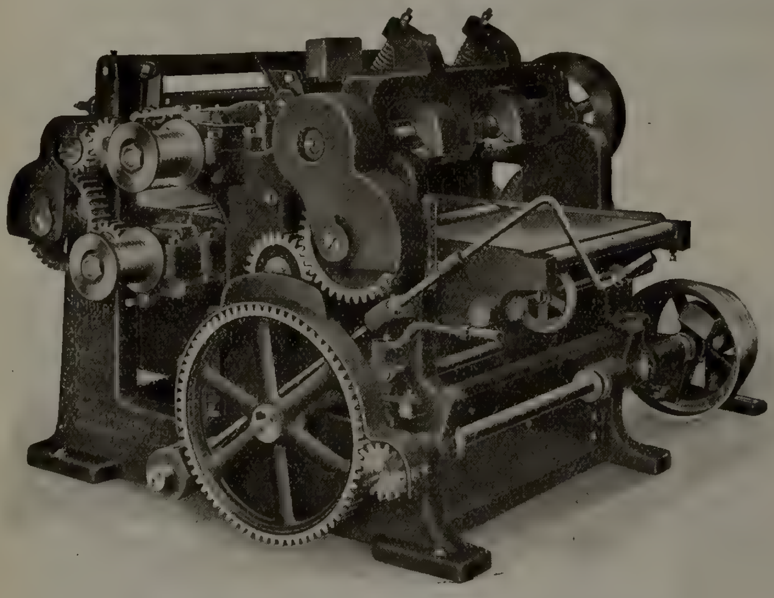
MOWRY & SONS Gravenhurst
Ontario

SURFACE



No. 2 Centennial Surfacer

More than 4,000 of these machines are in use in all parts of the world, under all sorts of conditions, and we have never had a complaint. This record speaks for itself. Capacity of machine 16″ 20″ 24″ wide and 6″ thick.



No. 140 Double Cylinder Surfacer
Patented 12/1/99—5/8/00—10/23/06

For either rough or smooth surfacing in planing mills, furniture factories, etc. Especially adapted for use in Box Factories. A general purpose surfacer. Made with feed rolls in two or four sections to work stock 24″, 27″ or 30″ wide by 8″ thick.

WRITE TO-DAY

Our Catalogue gladly sent free of charge.

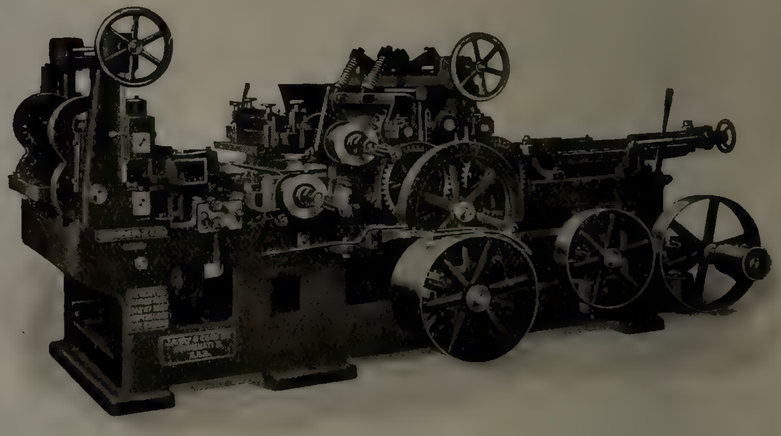
Sales Offices:

New York City, Chicago, St. Louis, New Orleans, Evansville, Atlanta, Detroit, Grand Rapids, Los Angeles, San Francisco, Vancouver, B.C. Seattle

The most complete line on the market made by the largest and oldest woodworking machinery manufacturers in the world. We have been building high grade woodworking machinery for eighty one years.

Showing application of Automatic
No. 156 SINGLE

Any of the machines shown here can be equipped with our patented round cylinders, air hardened steel knives and automatic grinding and Truing Attachments as shown above.



No. 275 Planer and Matcher
Patented 5/27/02—9/25/06—10/23/06—2/4/08

The greatest general purpose machine on the market. It is not only a fast feed planer and matcher but can also be used as a floorer, double surfacer or inside molder. Made with four or six rolls to work stock 10″, 16″, 20″ or 24″ wide by 6″ thick.

J. A. FAY & EG

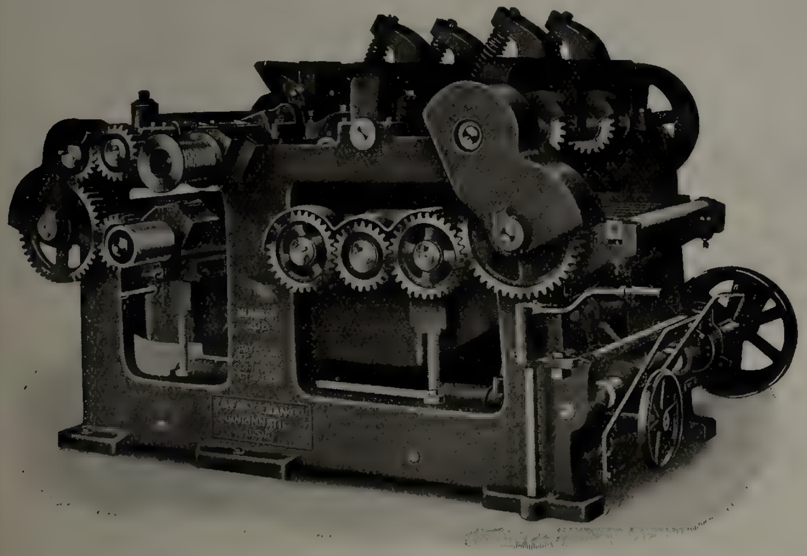
Establishe

PLANERS

All of our long experience has been put into our latest models, only a few of which are shown here. From the small 16″ pony planer to the big fast feed planers and matchers we make a machine to suit any and every requirement.

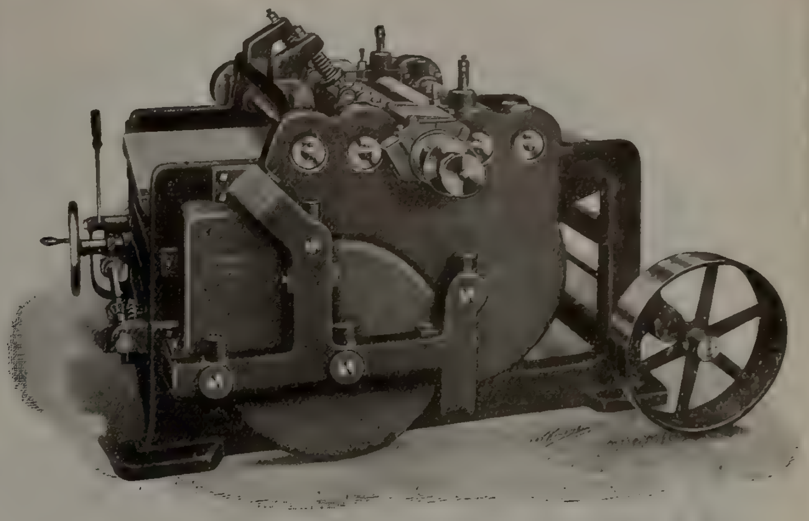
Grinding and Truing Attachment to
CYLINDER SURFACER

This last obviates the necessity of taking the knives off the head every few hours for regrinding. A great help in keeping up the efficiency of the machine.



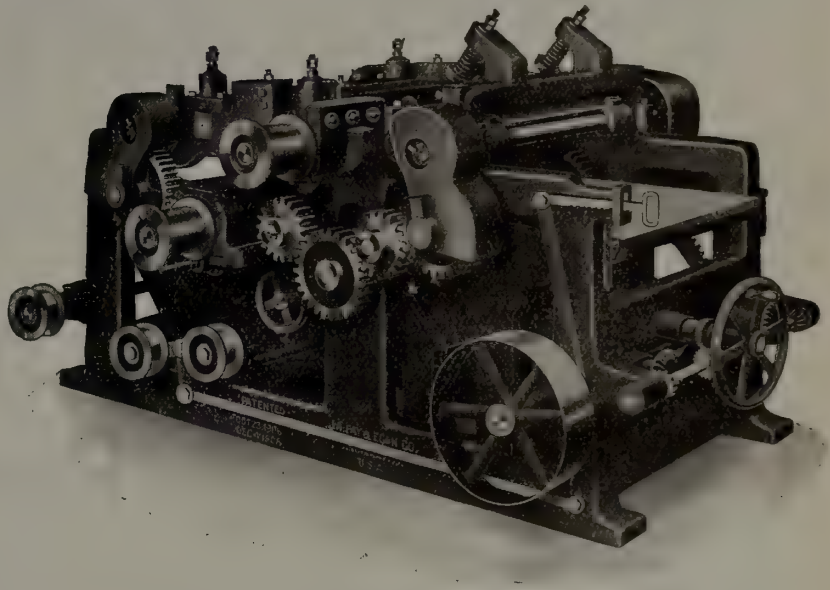
No. 206 Extra Heavy Double Cylinder Surfacer
Patented 12/19/99—5/8/00—10/23/06

Designed for extra heavy work in planing mills, box factories and the like. It is the most powerful double surfacer made, working stock up to 30″ wide and 12″ thick. Four section feed rolls permit feeding four pieces of varying thickness at one time, insuring extra large output.



No. 156 Single Cylinder Smoothing Planer
Patented 10/19/05—10/23/06—12/4/06

For producing extra smooth surfaces this machine is in a class by itself. We can only say it is the BEST single cylinder surfacer to be had—we will sell it to you guaranteed as such. Capacity of machine 24″, 27″, 30″, 36″, 42″ wide and 7″ thick.



No. 200 Double Cylinder Surface
Patented 10/10/05—10/22/06—12/4/06

For extra fine surfacing on two sides this will be found the most satisfactory machine on the market, quantity and quality of output considered. Especially adapted for use in furniture, parquet flooring and cigar box factories. Works 30″ wide by 7″ thick.

Samples of Work done on the No. 156 and No. 200 sent free upon request. They speak better than words.

Solid and Inserted Tooth
Circular Saws

We make a specialty of these lines
We remake old Solid Tooth Saws into new Inserted Tooth Saws
Write to us for quotations

Our saws have been before the public of Canada since 1855, and have won a reputation far excelling any other make of saws, combining as they do so many points of marked superiority.

By the old method the tempering of circular saws was to a great extent a matter of chance.

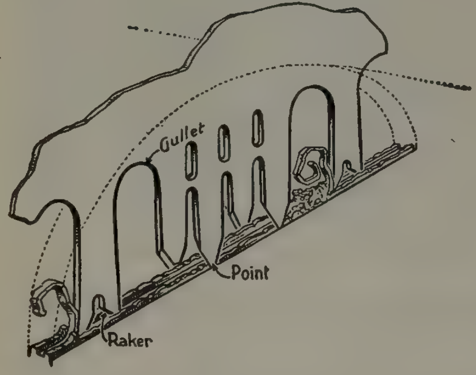
By our Patent Process that uncertainty is entirely avoided.

Being tempered and straightened by heat and pressure in air tight ovens at a uniform heat between heavy revolving plates, we produce a perfectly even temper throughout the plate, and being free from that uneven strain or tension caused by so much unequal hammering they are not so liable to buckle, which was a great source of trouble and expense in the old style of saw.

These saws will stand up to their work better under all circumstances, and being made of a higher quality steel than it is practical to use by the old method, they hold an edge longer and will do more work than any other saw on the market.

We are prepared to make prompt deliveries of all Saw Orders—Rush Orders by mail or wire receive immediate attention.

R. H. Smith Co., Limited
Saw Manufacturers
ST. CATHARINES, ONT.



Why Atkins Sterling Saws Run Free and Easy

Saws that depend on "set" for clearance have to tear their way through the timber, like the picture to the left. The teeth are sprawled out on either side and chatter and stick and bind and tear. That's why wood sawing is sometimes considered such hard work. That's why commonly ground saws can NOT run fast or pull easy.

ATKINS SEGMENT-GROUND CROSS-CUT SAW BLADES are ground thinnest on the center of the back. The teeth are the widest part, and the blade drops easily into the smooth cut which is made by the saw teeth. Very little set makes the teeth cut clean and the rakers clear the center. See the picture to the right. These Saws merely require enough power to pull them back and forth. That's why they run so easily.

ATKINS STERLING CROSS-CUT SAWS are the only Saws that are Segment-Ground, and for this reason are guaranteed to run easier and cut faster than any other Saws. Write us for free information, or order through your jobber or dealer. If they won't supply you, let us know.

USE

Your Mill's Refuse

To Dry and Preserve Your Wood

"The HOWARD" Vulcanizing Process

Positively the quickest and most economical system known for drying and Preserving Lumber, Railroad Ties, etc.

POINTS IN ITS FAVOR:

Improves quality of all lumber
Increases the crushing strength
Increases the transverse strength
Reduces the weight 30 per cent to 45 per cent
It materially prolongs the life of wood
Eliminates shrinking, swelling and warping
Emphasizes and beautifies natural grain of the wood
Makes fit for commercial use woods not otherwise merchantable
Does away with necessity of maintaining heavy stock of lumber in yards
By this process green lumber taken from the log can be used for building purposes in 2 or 3 days

---

We invite Lumbermen and Owners of Woodworking establishments to see a practical demonstration of the process at our plant in Toronto

Our descriptive booklet tells in a most interesting manner the advantages, etc., of "The Howard System." It's yours for the asking

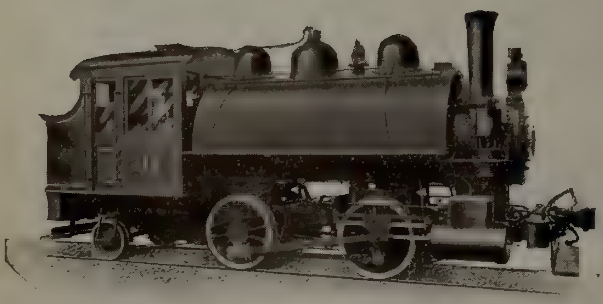
Western Representative: The Canadian Fairbanks Co., Vancouver B. C.

LOGGING LOCOMOTIVES



They have a short rigid wheel base, suitable for sharp curves, and the two where trailer truck provides steadiness and smooth riding. A good engine for rough and uneven roadbeds. Has low centre of gravity, hence not "top heavy."

The tank is placed over the boiler, which added weight is available for adhesion This permits of larger hauling capacity, and gives ample space in rear for carrying fuel.

Adapted to double-ender service. No time lost turning.

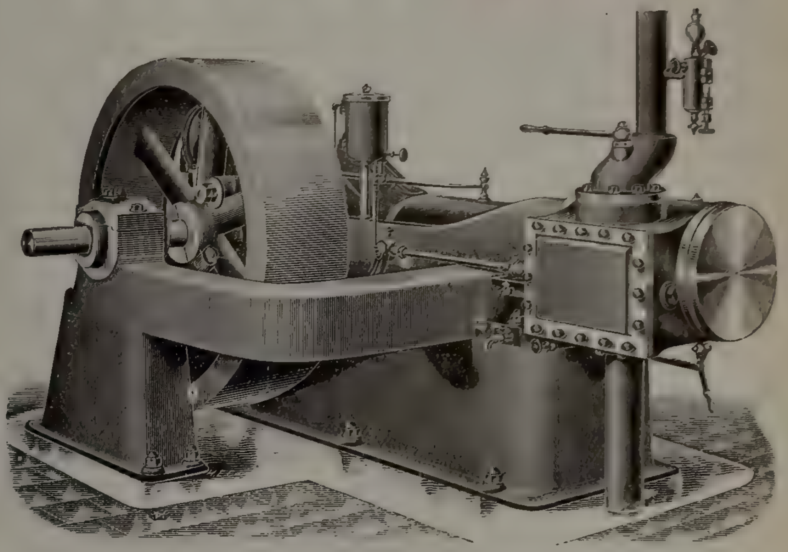
BEARINGS IN LINE



In sizes up to 125 horse power the outboard bearing of our side crank engines is connected to the frame by a wing, keeping the bearing perfecty in line.

These engines are built on the interchangeable system and duplicate parts are kept in stock, ready for shipment on receipt of order.

They have our latest improved governor and oiling system and are strictly high class in every respect.

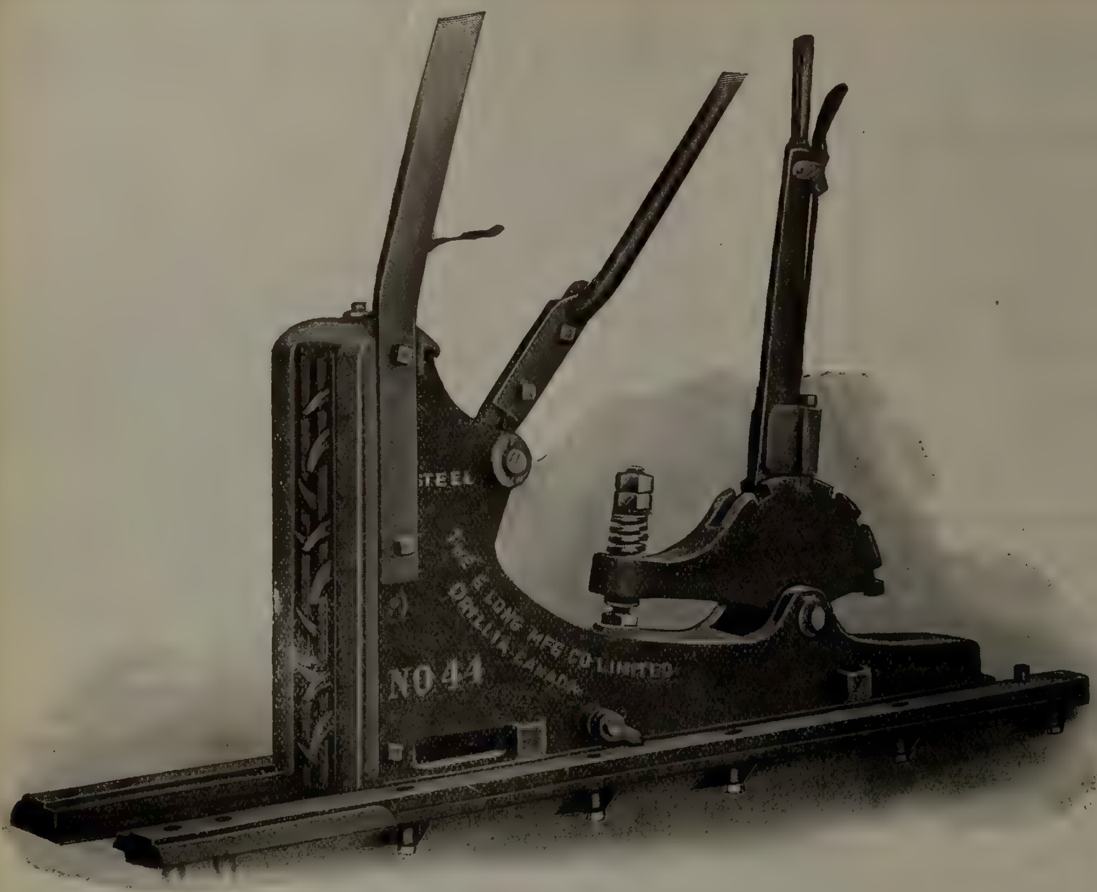
Not altogether what we say but what users say

"We have used the Alligator or Warping Tug manufactured by you for the last 7 or 8 years, and consider them indispensable to lumbermen on waters of French River or similar streams."

Will move a bag containing 60,000 logs, in calm weather, 30,000 in a head wind.

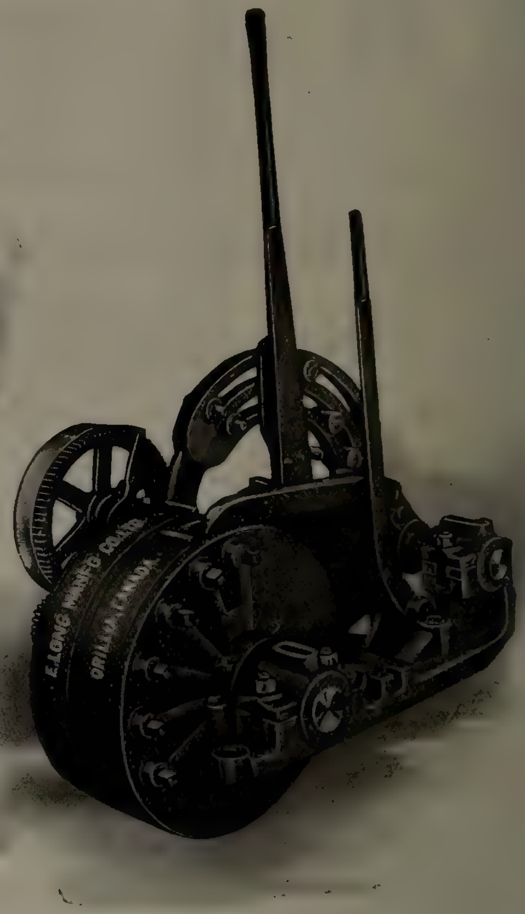
West & Peachey - Simcoe, Ont.



No. 44 Steel Carriage

¶ We build a full line of carriages, from the lightest for portable mills up to the heaviest type for Pacific Coast mills, also **Steam Kickers, Loaders, Niggers, Cant Flippers, Steam Feeds** and in short a complete line of **up-to-date Mill Machinery.**

It is always a pleasure to answer inquiries



Enclosed Set Works with double wheel

Hot Blast Grates

Did you ever consider what a great saving in fuel could be made if all your refuse could be burned. Our Hot Blast Grates will burn even wet sawdust and furnish a good supply of steam. Many satisfied users are saving money daily on their fuel bill by using our grates

Waterous New Champion Edgers

From the Operator's Point of View

The man who is *using* a machine is the best and severest critic of its worth. That's why we are building our Edgers to do the work not only in the quickest, cleanest and most accurate way, but are embodying features in its construction that make it easy to operate, simple to adjust, convenient for cleaning, and perfectly safe. Sounds like a pretty big handfull but its true. First take a good, close look at the cut we show and then listen to this :

The frame of the New Champion is built in box form open at the top to let in lots of light. The front rolls though very heavy are divided, and give the operator a clear view of the saws when cutting. He can watch his cant right through the machine.

The saws are shifted by our improved double shaft supported swing back guides. These are fitted with hemp rope plugs, the best non-heating plugs made to-day. Straight line levers are used in shifting. To ensure absolute accuracy in spacing the saws, a drop gate, operated by foot tread from the front of the machine, drops down over the guide and automatically crowds it into correct position and *holds it there.*

The planed cast iron board guide is also operated from the front of the table and by lever and quadrant can be adjusted to set the board being edged any distance up to four inches from the inside stationary saw.

To change the saws, all that is necessary is to remove the bridgetree supporting the third bearing, turn back the swing guides —(stationary as well as movable guides are made this way)—and slip off the saws. The bearings placed on each side of the driving pulley that support it against side strains when operating, will hold it perfectly in line while this is being done.

The Edger will take a 6" cant. Some operators have had their own experiences trying to put through stock that the manufacturers' cotalogues say there machine will handle. But we mean this. We put a 22" saw on the mandrel, this carries a 6" collar, giving a good 7" cutting edge. And another thing we supply a mandrel 3⅞" in diameter that will take the strain of the maximum cut and never spring a particle. This seems pretty nearly likely when you consider its size in comparison to that supplied on most other machines of this capacity, and add to this the fact that it is supported in three boxes having a bearing length each of almost ten inches.

Then, to make the operation absolutely safe, *four* feed rolls, chain connected and driven from the saw mandrel, are supplied. These are fluted to give a firm secure grip on the timber but will absolutely not mar the same in any way. Press rolls, divided to permit two sides of the Edger to handle different sized stock at the same time, are very heavy, swing away from the operator to feed more readily and thus secure a more permanent safety grip on the cant.

We supply the boxes with caps that are fitted with large oil reservoirs, and consequently require little attention. Every box is adjustable and readily gotten at.

There is a whole lot more that we would like to tell you about these Edgers that we we cannot get into the space at our disposal. Our bulletin, though, gives it all in the clearest possible manner. Let us send it to you—free.

440 Square Miles Timber Limits

on Georgian Bay

to be Sold by Private Sale in Large or Small Blocks.

On account of their President and Principal shareholders being engaged in other large enterprises, and not having the time to give to them all, THE PARRY SOUND LUMBER COMPANY, Limited, offer for Sale all of the timber lands, mills and town property situated in the Town of Parry Sound; also Tug Scow and full Camp Equipment for five camps, including boom chains, snow plows, sleighs, etc.

THE LIMITS TO BE SOLD

comprise some 440 square miles of licensed and deeded Pine, Hemlock, Spruce, Birch and other timber. The licenses from the Ontario Government include all timbers and are not restricted for time. Government dues are as follows: Saw Logs, White Pine, $1.50 per M. ft., B.M. Saw Logs, Hemlock, Tamarac and other woods 75c. per M. ft. The timber is situated in the Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street. The Canadian Pacific, Canadian Northern and Grand Trunk Railways run through the limits, which makes some of the parcels offered for sale particularly desirable for small mill owners.

A circular giving full information, maps, terms and conditions of sale will be furnished upon application to

This saw that represents the big economy whether Band or Circular, is not the one you pay the least for delivered down at your mill.

he frequency or infrequency with which they must be changed, and filed and tinkered with counts some, for this takes time, you know, the time that runs into money, and it is only the saws that are able to hold an edge and that won't crack, that make for economy.

Simonds Band Saws, because of the selected material used, their uniformity of temper, their hardness without brittleness, their eveness in grinding and strength of the brazing, are used in the biggest, busiest mills in the world for the sole reason that being so made they cut more lumber, stand more wear, tear, and hard driving, than saws of other make.

Your first order for a Simonds Saw, let it be Band, Gang, Cross-cut, or Solid or Inserted Tooth Circular, will make this so evident that it will never be your last.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Vol. 31 Toronto, June 1, 1911 No. 11

Fire Prevention and Insurance

The dry season is at hand again, and owners of lumber mills and timber limits are once more face to face with the problem of preventing their property from being destroyed by fire, for a period of some five or six months. There is no question that lumber fire losses can be materially reduced. We have grown so accustomed, in the years gone by, to thinking of a sawmill as a natural prey to the flames, that we frequently fail to give the subject that careful study which it deserves. One would think, on account of the natural tendency of lumber property to catch fire, that the matter would have been given many times the attention which it has received in the past. There is something fatalistic in our natures, however, which induces many of us to think that if our property is going to burn, we cannot help it.

We can avoid fire in many cases and if we wish to make a certain success of our business, we must adopt every means to this end. It is the part of wisdom to insure against loss by fire, and it is natural after insuring to feel a little less anxious than formerly. It is not right, however, to simply insure and then give no further attention to the fire question. Insurance carries with it a duty. Those who insure their property should see to it that they give the insuring company a square deal, and also at the same time that they do all they can to minimize the risk of fire. Not only is this a duty which they owe to the insuring company, but it is a certain means of reducing the cost of insurance. A sawmill in which everything necessary is done to prevent the occurrence or spread of fire is a very attractive risk for any insuring company. It is an even better risk than an ordinary class of commercial building, which on account of its general immunity from fire is not properly looked after. This fact is borne out by the ability of the lumber specializing insurance companies to do a prosperous business on a lower premium rate than the old line companies. It is only of recent years that the old line companies in order to regain some of their business, have reduced rates to the level of the lumber specializing companies. The success of these companies is due entirely to the fact that the lumber risk when properly managed can be greatly improved from an insurer's point of view. Of late years the actual losses by fire on lumber properties have been considerably reduced, and it is possible that the means which have assisted in bringing this about can reduce the losses still further.

No owner of lumber prefers to have his stock destroyed. It interferes with his business and even though he may have the stock fully insured he must lose business, and be caused a great deal of worry. It is reasonable, therefore, that he should take advantage of the attractive rates presented by lumber specializing companies, and that he should adhere to the regulations which they impose. If his lumber were twice as valuable as it is, there is no question that he would take much greater care than he usually does, and that the total losses of lumber by fire would be greatly reduced.

A view of the situation which is ignored too frequently is, that although a given loss may be fully covered by insurance, the actual loss to the country is not prevented. Just that much natural wealth is destroyed and can never be replaced. The money which the insurance companies are obliged to pay for the rebuilding of that particular industry might otherwise have gone into some new business and helped to develop the country.

It is the duty of everyone who owns lumber or timber to do his share in its preservation from fire. Everyone to-day is talking about conservation of natural resources. This is one of the easiest and most practical methods of conservation. Every yard in which lumber is stored should be kept as clean as possible, and regulations regarding clear space should be strictly adhered to. If this were done, thousands of dollars would be saved. Fire is the greatest enemy of our forest resources. It is ever lurking to destroy them, from the time a tree first comes into existence as a sapling in the bush, until it has finally been placed in position as a manufactured product. Governments, owners, and users of lumber, must fight, not only with cash, but with eternal vigilance. From now until the snow flies again, that vigilance must be redoubled.

Courtesy a Valuable Asset

One hears a great deal about matters of courtesy on the part of the retail dealer. As an advertisement, courtesy is one of the greatest assets that a dealer can have. Its usefulness, however, is not confined to the retailer. In every branch of trade, and in the lumber trade as much as in any other, courtesy is a prime requisite. So much is this the case, in fact, that lumbermen have, as a body, realized it long ago, and are noted the world over for the courteous manner in which they conduct their business dealings. There is no body of men in the world to-day more entitled to the respect of their associates than those who follow the lumbering industry. There must be something about the open air life and the association with nature in its most attractive moods, which makes of a lumberman, what is generally understood by the term "good fellow." For this reason the courtesy of the lumber manufacturer and the wholesaler has become a by-word among business men. Unfortunately, this does not always apply quite so completely to the retail trade. Those in the retail trade who have built up a successful business, however, can in every case lay much of the credit to the fact that they have made a point of doing everything possible to please their customers, and to treat them with just as pleasant a manner as they would bosom friends.

It is impossible to overestimate the value of courtesy as an advertisement. It is a difficult matter, no doubt(at all times to preserve one's good nature in the face of the aggravation, which is often presented by an exacting customer who wants only a few boards, but who insists on taking up much of one's time in selecting them and in conversation. The dealer will sometimes actually lose money on a customer of this sort, but if he treats him with courtesy, it is a safe wager that the same customer will some day need a very large bill of lumber and will come back to the yard where he received pleasant treatment when his order was insignificant. When one considers the directness of this sort of appeal and the cheapness of it by way of advertisement, compared with many other forms of attracting trade, the wonder is that, as a commercial factor, it is so often overlooked. It should not be forgotten also, that the man who is well treated, frequently becomes an advertisement himself. He is certain, in the course of conversation, to mention to someone else that he has been well received, and treated as though his trade were worth going after. A customer of this sort is a perpetual live advertisement.

Courtesy, therefore, may be estimated as one of the most important factors in the upbuilding of a good business. It is by no means, however, the only important factor. It must be combined with thorough knowledge of the trade and ability to furnish, with the least possible delay, just the class of lumber that is desired, at prices which will prove attractive. It is a well known fact, however, that many dealers depend far too much upon their ability to provide stock at attractive prices and ignore to a great extent that measure of affability which goes so far, not only to sell the bill under consideration, but to bring a customer back when he has another bill to fill. Yards often become unpopular just because one of the employees who deals with the public has rather a brusque manner. He is perhaps a little too keen upon closing the deal, and a customer goes away with a feeling that, although he has obtained the lumber he wants, he has been an unwelcome visitor, and he considers, even before leaving the yard, whether he cannot fill his next bill somewhere else, to just as good advantage. The fault does not lie directly with the owner or manager. He cannot always be in the yard, and he must depend upon his employees, who look after the actual treatment of customers. A retail lumberman however, who desires to build up a large and dependable trade, should make a point of keeping in close touch, both with his employees and with his customers. He should try to instil among his employees a spirit of good will and geniality towards customers and he should be on friendly enough terms with many of his customers to question them from time to time about the treatment they receive in the yard.

This applies in all classes of retail trade, but more especially perhaps in the country yard where the business is largely among farmers. Business men in the cities do not expect a dealer to spend much time with them. Their own time is too valuable. But the farmer is not a business man, in the ordinary sense of the term. When he goes to town he has time to spare. Much of his own working time is spent alone, and when he goes to town he looks forward to a good talk with some of the business men. He likes to be made much of, and expects to be received as though his trade were of the greatest importance. It is essential, therefore, that the retailer should take care that his yard employees know how to treat all those who come to buy lumber and that they should in every case try to treat customers in such a manner as to make it reasonably certain that they will come back and that they will say a good word now and again for the place where they have been well received.

The Importance of the Wholesaler to the Lumber Trade

So much is said about the hardships of the retailer, and the manufacturer of lumber, and there are so many problems peculiar to each branch of the industry that it often happens that the importance of the wholesaler to the trade is greatly under-estimated. It is no exaggeration, however, to say that the wholesaler is one of the most important factors in the lumber trade, and that on this very account he has troubles of his own, just as great, and just as difficult of solution, as those of any other branch of the business. The wholesaler is in reality, a buffer, between the other branches. If there is any trouble about grades, prices, or quantities, in connection with a sale, the wholesaler comes in for his share of trouble from both the retailer and the manufacturer. It thus comes about that the wholesaler is not only a useful factor in the trade, but is practically indispensable.

A successful legitimate wholesaler of lumber is one of the most versatile men to be found under modern business conditions. It is essential that he should be familiar with every branch of the lumber business from the tree to the retailer's outgoing load. When selling the output of a mill he must know all about the cost of stumpage, and of manufacturing, and he must employ all his optimism and persuasion, in order to keep up prices. His very existence, as a business man, depends upon securing a good enough price to satisfy the manufacturer—a man who knows all about the actual cost of the lumber —and to provide himself with a living profit.

For these reasons the wholesaler should be one of the most welcome visitors that a retailer has to receive. He should be recognized as the man who makes business possible, and profitable, and it should be the object both of the retailer and of the manufacturer to facilitate the wholesaler's business. Some of the considerations suggested by this subject were dealt with in a practical manner recently, in an address given by one of the speakers, at a convention of lumbermen, who said:

"You cannot conceive or realize the many obstacles with which the wholesaler has to deal; he is at one time on the side of the retail dealer, and another time on the side of the manufacturer, but generally btween the two; and, if you will think for a minute, you can imagine the many troubles that you and the manufacturer cause him. In the settling of disputes which at times arise from not shipping grades of material called for on the order, you first submit your complaint to the wholesaler, and he in turn submits it to the manufacturer. The manufacturer in most cases takes the stand that your claims are unjust and unreasonable, and when the wholesaler submits this information to you, you turn to him and say: 'We will not buy any more lumber from you if you do not settle this claim according to our understanding,' and then when he turns to the manufacturer and says to him, 'Our customer, Mr. So-and-so, will not accept settlement on off-grade stock in such-and-such a car only on one basis, as outlined to you in former correspondence,' the manufacturer then replies to the letter by saying: 'We cannot afford to do business with a customer taking such an arbitrary stand regarding the disputed off-grade stock.'

"Now, this is a matter that you have not thought of in the proper light, and I believe that when you institute a claim you should at all times be very explicit as to the why and the wherefore, the stock is not up to grade, and point out the defects to the best of your ability, and when you have done this, you have done your part, and then, if the mill is not satisfied, it is up to them to order official inspection, so as to satisfy themselves.

"There is another matter, however, to be considered by you, and that is the over-zealous salesman of the wholesaler soliciting your business If he would confine his sales solely to his stock sheets, agreeing to deliver what he has on hand, and not accept orders for stock that is not shown on same, thereby obviating shipment of green lumber, and delaying orders, how much better it would be for all concerned. It is the business of a legitimate wholesaler to fill your orders as they read, not going upon the presumption that he knows better what you want than you yourself, and whenever he fails to do this, then he should be made to suffer the consequences. I have no patience with the wholesaler (and I believe there are few in existence to-day) that may accept your orders for one grade of material and ship a lower grade from a mill in order to make a large profit. This should not be tolerated, and whenever you and a manufacturer discover that a wholesaler is following such tactics, it is your duty to the lumber industry to eliminate such concerns, and use every legitimate means to eliminate them from the business.

"Some of our mill brethren are under the impression that the wholesaler is a detriment to the business. In this they are seriously mistaken, for the wholesalers, at all times, act, in a way, as a clearance house for all surplus items at the mills, and are enabled to do this by reason of the fact that they maintain selling forces that have no superiors, who go into every nook and corner in the country seeking orders for such stock as the manufacturer is desirous of moving; and they have to get the price for it or they don'e get the material from the manufacturer. They are of material benefit to the manufacturer, for the reason that they market the product of a small millman of from 15,000 to 75,000 per day, and keep this memorandum of his before the market, and it is reasonable to presume that they are going to ask as much for this stock as the largest manufacturer in the business."

Variations in the Practice of Piling Lumber

The practice adopted in different lumber yards in connection with the piling of lumber, varies greatly, according to the special circumstances of each case. There are, however, many important points upon which most yard owners agree, and which should be carefully thought out, and applied in the most practical manner in each yard. Take, for instance, the lumber yard in connection with a box factory. Probably nowhere else in the lumber business is there to be found such a varied assortment of lengths, widths, thicknesses, and grades of lumber, and nowhere else would it seem to be so important to have the piling carefully planned. There are some box manufacturers in a large way of business who have made a success of their work, and who believe that it is not worth while to pile lumber according to sizes, and grades. Perhaps they are right. It will be found in nearly every such case, however, that they have in their employ yard foremen who are much more efficient than the average man who occupies a similar position. Most manufacturers believe in sorting their lumber into piles according to the grades, widths, lengths, and thicknesses, from the very outset, and continue this practice throughout. Of course, it involves a considerable expense to pile in this manner, yet it is a great saving to be able to place one's finger on just exactly the class of lumber that is needed for any particular job and to be able to get it without delay. There are no vexatious delays in tearing down piles to get at the lumber, and then having to pile up again all that has been removed. The location and the layout of the mill and yard, of course, have much to do with the solution of this question. When planning these, one should have the mill accessible from all sides. This makes it an easy matter to get at the lumber, and it also reduces the length of the haul from the pile to the saw. It may seem to be a small matter to haul the lumber a few extra yards, but when these extra yards are added together they make quite a long haul in the course of a year. There is, moreover, not only the actual cost of hauling to be considered, but the loss of other workmen's time while the lumber is being brought to them.

Again, in planning the location and lay-out of the mill and yards, one should pay particular attention to the accommodation for dry lumber. As much shed room as possible should be provided, so that one may be independent of the weather. One large manufacturer speaking of this subject recently, stated that he always carried as large a stock of lumber in the mill as possible, so as to have on hand enough to keep the mill running for a long time ahead without regard to weather conditions. Another manufacturer discussing the subject said that he made a point of having at least one month's stock stored in the mill at all times. In piling lumber in the yard, much can be done to save it from the effects of bad weather. By piling the long boards on top, those underneath will be saved from the rain dropping on them. At least, the top boards should be as long as the longest in the pile.

Start

The other side of the case will often be heard from men who have been in the business a long time. One manufacturer recently stated that he even found it quite impracticable to pile his stock in grades, lengths, widths and thicknesses. Of course, he takes the general precaution of piling the long boards on top. He is one of those fortunates, however, who has a yard foreman upon whom he can depend absolutely. This is the case more often in small yards than in others, as the necessary economy of space prevents one from erecting a large number of piles. It is safe to say, however, that in most of these cases the owner of the yard would gladly adopt the system of piling according to sizes and grades, if he had the space in which to do it.

The whole matter comes down finally to a question of the ability of the foreman. In a box factory yard, the foreman is more important than in the ordinary yard. In these yards there is collected together the most varied possible assortment of lumber of all grades and sizes. Unless the foreman knows where to find every class of stock, he will make the most distressing sort of a muddle of the whole business. He must know what lumber is in each pile, and from experience he must know how to pile the stock, so that even one board of a particular class may be removed, if necessity requires, with the least possible trouble and delay. This means a thorough acquaintnce with the requirements of the factory, so that the sizes which are most likely to be in demand may be arranged in the most available places. Taking the whole question into consideration, the general practice is in favor of piling according to sizes, and grades, and in doing so to employ, if possible, a foreman with common sense, excellent judgment, and long experience.

Editorial Short Lengths for Busy Readers

Last season Canadian charterers inserted in their charters the following clause for shipment of lumber to England: "On completion of loading, charterer or his agent shall have liberty to board vessel, and to cross-mark the top pieces of the deckload; also to mark on uprights in painted lines the height of deckload; ship shall give due notice of completion of loading, and facility for so marking." It appears that this clause was insisted upon by underwriters for their protection against claims for loss of deck cargo, and it is reported to have proved most efficacious. The clause is, therefore, to be continued. There was a large amount of loss last season through loading operation from barges or rafts alongside, and this season underwriters are quoting two rates of premiums—one for goods from f.o.b. steamer, and the other, and a much higher figure, to include the risk of lighterage alongside. All rates are being considerably advanced this season.

The United States consul at Campbellton, N.B., in a recent report to his Government, says: "Observation and inquiries lead me to believe that an alert American business man would do well to establish a trading house at Campbellton and handle a number of lines of manufactures that are or might be in general use among the people of New Brunswick. Such a house could handle with profit sawmill machinery and tools, belting, manila rope of various sizes in use by the logging groups, cotton waste, and various other lumber mill and logging camp supplies; metal ceiling and sheathing; asbestos roofing and sheathing plates; bank and office ornamental railing, verandah railing, ornamental lawn fencing and gates, and a variety of patented specialties; special lines of furniture and probably some marine supplies, etc."

Industrial and trade conditions in Great Britain are showing encouraging improvement. The Timber Trades Journal, in a recent issue, refer to the situation as follows: "The greatly improved condition of trade generally in the country is giving a decided impetus to building. It is gratifying to note that from towns where the building industry has been in a stationary condition for a long time past there is now renewed activity in building. The general trade improvement began with the beginning of the year, but, as usually happens, some months have elapsed before builders benefit to any extent by the change for the better. The shipbuilding, iron and coal industries are all in a healthy condition, and, as they are likely to remain so for some time to come, unless labor troubles intervene, the immediate future of the timber trade may be regarded as bright."

Price cutting and excessive credits are not characteristic of the Canadian trade alone. In England the same troubles permeate the trade, as shown by the following from the Timber News: A good deal has been said of late in regard to the question of excessive credit granted by the trade, and undoubtedly some drastic remedy needs to be applied in that direction. On the other hand there is another question which is well worth ventilation, and that is the exceedingly low prices which are rulling to-day. If the principals of the various timber firms would put their foot down, and would accept of no orders which did not show a fair percentage of profit, the present outrageous competition would soon cease. Why should not a basis selling price be established beyond which no importer or merchant should be prepared to go? The mischief largely arises by principals taking notice of statements, mostly incorrect, as to what competitors are prepared to do."

Ontario's Report of Lands and Forests

Total Revenue for Year 1910 $1,835,082—Outline of the Year's Forest Fires—Changes in Fire Ranging

The report of the Minister of Lands, Forests and Mines of the Province of Ontario for the year ending October 31, 1911, has recently been issued. It contains information of much interest to the lumber industry in Ontario.

The total revenue from woods and forests for the year 1910 is $1,835,082.71. Of this $1,634,496.21 appears as timber dues: Deposits on account of simber sales, $92,396.36; ground rent, $104,326.64, and transfer bonus, $3,863.50. It is proper to say that the item of timber dues includes approximately $200,000 bonus as timber was cut. Had timber sales been by the mile, as formerly, this amount would have appeared under the head of bonus. Until all the accruals for the year are paid in, it is not possible to give the exact figures of bonus revenue, but if this$200,000 is credited to bonus the fact remains that the collection of timber dues is still the largest in the history of the Department. The revenue for the year just closed is the first full year's revenue under the new system of having the financial year end on the 31st of October instead of the 31st of December, as formerly was the case. The revenue from ground rent is also the largest in the history of the Department, which is caused by the increase made in the amount of the annual ground rent payable from $3 to $5 per mile, which change took effect for the first time for the season of 1910-11. The charge for transfer bonus was also raised from $3 to $5 per mile, which sensibly increased the small revenue derived from this source. An Order-in-Council was also passed increasing the dues payable on timber when cut on those berths sold previous to 1890 from $1 to $1.50 per thousand feet board measure, but as this increase did not affect the cut of 1909-10 no benefit has been experienced from it this year. The revenue from bonuses was not as large as it would have been had the timber berths offered not been damaged by fire, and financial stringency prevailed, which made it necessary to make the deposits as low as possible so as to ensure competition for the damaged timber. I pointed out in my last report that the system of issuing permits had been brought to an end, and in order that those engaged in lumbering who had invested in large plants and mills should not have their investments wiped out, it was necessary to give them an opportunity to acquire timber at public sales in the ordinary way. The only permits now existing are on the Transcontinental Railway, where if the railway was to be built contractors had to be permitted to cut ties, etc.

During the past year very serious forest fires occurred in the territory west of Lake Superior, and a very considerable area was burnt over. A good deal of this territory had been lumbered over under authority of permit in years gone by, and the small quantity remaining was not of a first quality, being rough and scattered. It was, however, important to get for the province the money value of it. Immediately on receipt of inofrmation that fires had occurred rangers were put on to examine and estimate the territory, and surveyors were sent to define the berths so they might be offered for sale. The territory to be sold was cut up into very small berths so as to give the widest possible competition by allowing the small operator to come in. The damaged timber was sold by the thousand feet board measure. The timber being damaged and scattered, the prices were not as high as they would have been for green timber, and the licensees having large quantities of their own timber damaged which they had to take care of, the competition was not as keen as it otherwise would have been, but having regard to all the circumstances, the sale was satisfactory.

During the past winter the cutting of timber damaged by fire in the Mississaga Forest Reserve was proceeded with under the supervision of a carefully selected staff of rangers and scalers appointed by the department, whose count and measurements were final for revenue purposes. The considerable prices to be paid for this timber made it necessary that very close measurements should be made, and that the cutting should be carried on in an economical manner as respects the character and size of the trees to be cut, as well as making allowances for timber damaged by fire, and the other defects usually found in timber. In order to prevent disputes the cullers were required to put on the end of the log, in black chalk, the contents they allowed, so that the lumberman might see that he was getting a fair measurement, and the Crown ranger, whose business it was to check up the measurements of the cullers, might do so with readiness and thoroughness. Although there were differences of opinion between the operators and the government scalers; they were not serious and the accounts were based on the measurements of the department's officers. This system of measurement and supervision of cutting is now applied to all sales made by the thousand feet board measure system. It was estimated that the output for 1909-10 would be 100,000,000 feet in excess of the previous year. As a matter of fact, the output of pine was about 142,000,000 in excess of 1908-09. The estimater for the present winter of 1910-11 is that there will be an increased output of about $50,000,000 feet B.M.

Change in Fire Ranging Regulations

During the past year an important departure was made in respect to fire ranging on licensed territory. The stumpage value of timber had greatly increased, but this increase had inured to the benefit of the timber licensees. The time seemed to have arrived when the licensees should bear the whole cost of the fire-ranging and protection of their timber. In considering the question of increasing timber dues and ground rent, the matter of the cost of fire-ranging came up, and it was understood and agreed to that the whole expense, except as regards printing literature, copies of the Fire Act, diaries, etc., should be borne by the licensees; therefore, this year, the timber licensees have borne the entire cost of fire-ranging on licensed territory. There has ,however, been no change in the supervision of the fire-ranging on licensed lands. The licensees have still to submit the number of men and the names of the fire-rangers they propose to employ, and the limits on which they are to be placed. The department instructs the rangers as to the performance of their duties. It supplies them with literature and copies of the Fire Act—pamphlet and poster. It clothes them with authority as government officers; appoints them fish and game wardens, and furnishes them with diaries in which they have to enter their movements from day to day—which diaries have to be sent in to the department at the end of the season, verified by the affidavit of the rangers. Rangers are required to report all serious fires to the department, as well as to the licensee. The department requires that fire rangers shall be placed on all limits, and if the licensees fail to put them on, the department under takes that duty and charges the expense against the berths for which it appoints the rangers, and makes the charge a lien on the berth, which must be removed before a license will be renewed. The licensed territory is divided into districts of convenient size, for purposes of supervision, and experienced bush rangers are placed in charge of the fire rangers in each district. This superintendent has the direction and supervision of all fire rangers under his care; sees that they are placed on all limits; that they are discharging their duties properly, and generally represents the department and the licensee. In the event of a serious fire taking place, the district ranger takes charge and directs the work of suppression, and on the fire being extinguished reports fully to the department where the fire occurred, its cause (if it is possible to ascertain this), the quantity of timber damaged, and all other particulars. Thus it will be seen that the department has not parted in the slightest degree with its supervision and control of the service—the sole change being that the licensees pay the expense of fire-ranging on their licensed territory.

It may here be stated that there were no forest fires of any consequence on licensed territory east of Porth Arthur during the past year. The supervision was evidently close, and the result satisfactory. There is no doubt that the constant presense of fire rangers, year after year, calling attention to the danger of setting out fire, inculcating a spirit of carefulness and responsibility, and the distribution of the Fire Act and other literature, has had an educative effect, and we are now reaping the benefit of this service by immunity from serious fires during the past year.

In the region west of Port Arthur, especially in the Fort Frances district, the summer was very dry and warm. Indeed it was said to be the driest summer for a period of thirty years. No rain fell and in consequence the forest was in a highly inflammable state. Serious forest fires took place on licensed territory there and on lands of the Crown, away from settlement or railways, and large quantities of pine timber were seriously damaged. This timber is being taken out during the present winter, as the department notified the licensees where the damaged timber was, and directed them to cut it, intimating that in the event of their failure to do so, they would be held accountable for the loss. Every effort was made to discover the cause of these fires, but in that immense region it is most difficult to ascertain who started it, or how any particular fire was set out. During such a dry summer as the past, fires may be expected to run with great rapidity, and the throwing down of a lighted match or cigarette would be sufficient to cause a conflagration of a serious character.

The railways have been blamed for carelessness, but, though careful enquiries were made, the department was unable to bring home to any of them any carelessness in connection with their engines. Curious to note some of the most serious fires that occurred, were away from railway construction, settlement, or lumbering. On the other side of the boundary line, in the State of Minnesota, serious fires occurred, entailing great loss of life, and some of them crossed into Ontario. Fortunately we experienced no loss of life, although serious damage was done to the forest. There were on duty on licensed lands, during the past season, 427 fire rangers, all paid by the timber licensees.

Mention is made of the fire-ranging operations on the government forest reserves. About 288 rangers in all were employed at this work. On the Temagami reserve there had been great danger of fire on account of the extensive prospecting for gold and silver, but fortunately there had been no serious damage from fire in that district. No fires occurred in the Mississaga, the Nepigon, or the Eastern reserves, where adequate staffs of fire rangers had been maintained. The Sibley reserve also had escaped fire. The Quetico reserve had suffered from fire to a certain extent. Serious fires had occurred at other points in the Thunder Bay and Rainy River districts. Altogether about 1,000 miles of territory had been more or less damaged by fire. The sale of damaged timber, having regard to all the circumstances, had been fairly satisfactory. "It is believed," the report says, "that the actual waste from fires during the year will have been kept considerably below 50,000,000 feet board measure." Referring to the danger of fire along the line of construction of the Transcontinental Railway the report states that the presence of fire rangers patrolling the line every day had kept the duty of the railway authorities continually before their minds and had had an excellent effect upon the men employed on construction. "There is a splendid spruce forest along this line capable of producing great traffic for the railway, inducing the erection of pulp and paper mills, and affording employment to thousands of people, who will in the near future find homes in the great clay belt. It will require great effort and expense to protect this timber but it will repay all the money spent, if the timber is preserved."

The whole fire ranging staff on duty last summer on licensed lands, forest reserves, railway and Crown territory aggregated nearly 1,000 men. Referring to the difficulty of securing experienced fire rangers, the report says:

It is a difficult matter, at the season of the year when fire rangers are most required, to obtain a number of well skilled bush men, who are educated and otherwise well-equipped for this work. In the early part of the summer, such men are still employed by the lumber companies in driving the streams, and again in the months of August and September, lumbering operations are beginning for the ensuing winter, and such men are looking for a winter's employment and will no tstay on fire ranging when they can get better wages, and be sure of several months steady work. The department has had to select a portion of its staff from other sources, and it has drawn upon the body of students at the School of Practical Sceince, at the University, and elsewhere for some of its fire rangers. These students are active men with some scientific training and give fairly good service, as soon as they get a little experience. If the department could get thoroughly educated bush men with the necessary education and judgment, it would employ them to the exclusion of all others, but not being able to do that, it makes the next best selection possible. The men selected are put under competent chiefs, who fully instruct them in their work and see that they perform it. The greatest care is exercised in picking out the men best qualified for the position from those who apply. Higher attainments are being required each year, and stricter conditions enforced."

The revenue from the woods and forests during the year was divided as follows: Western collections at department, $1,528,980.35; Belleville collections, $40,573.60; Ottawa collections, $265,528.76; total, $1,835,032.71. The area covered by timber license in the province during the year totalled 20,242 square miles. The timber cut, upon which dues were paid to the government was as follows: pine saw logs, 573,746,453 board feet; other saw logs, 84,234,194 board feet; pine boom and dimension timber, 32,869,338 board feet; other boom and dimension timber, 11,265,999 board feet; pine square timber, 304,584 cubic feet; hemlock square timber, 4,203 cubic feet; piles, 34,243 lineal feet; pilings, 85,224 board feet; cord wood, hard, 18,061 cords; cord wood, soft, 25,650 cords; tan bark, 14,776 cords; railway ties, 3,803,656 pieces; posts, 1,322 cords; telegraph poles, 7,223 pieces; shingles, 23,500 M.; pulpwood, 99,995 cords.

The office of the Canadian Lumbermen's Association, formerly at Rooms 5 and 6 Carleton Chambers, Ottawa, has been moved to No. 19 Castle Building, 53 Queen street, Ottawa.

Continuous Expansion of the Canadian Lumber Trade as Indicated by some Interesting Returns

A report on the forest products of Canada in 1909, issued by the forestry branch of the Department of the Interior, contains some interesting statistics. In spite of the exhaustion of some sources of supply the output of sawn lumber increases. The quantity for all Canada is given as 3,348,176 M. feet in 1908 and $3,814,942 M. feet in 1909. The growth is partly due to new areas being made available, and partly to the utilization of woods that in the past were not in demand.

Oak, hickory and walnut, all of which were once cut into lumber in parts of Canada, have been exhausted, and figure now in the records as "other woods," such trees as are marketed being taken from the uncleared portions of farms in the older settled districts. The "soft woods" are the mainstay of the industry, spruce leading in quantity, though not in value. The product in the two years mentioned of the leading varieties in thousand feet are given:

	1908	1909
Spruce	1,027,987	1,124,949
White pine	953,044	1,046,783
Douglas fir	371,845	469,658
Hemlock	259,096	302,721
Cedar	122,834	189,391
Red pine	134,828	165,886

White pine, though in the quantity of the output it is second, in value leads all the rest. The figures of all the lumber woods in 1909 were: White pine, $22,563,447; spruce, $16,365,720; Douglas fir, $6,850,579; hemlock, $3,577,372; cedar, $2,645,379; red pine, $2,777,734; balsam, $1,170,840; larch or tamarack, $1,027,344; birch, $990,393; maple, $729,162; basswood, 836,602; elm, $582,999; jack pine, $404,586; yellow pine, $345,710; ash, $315,367; beech, $216,052; poplar, $101,200; oak, $199,205; hickory, $22,100; walnut, $2,440.

These values are calculated from mill prices, which vary from $47.84 per M. for walnut to $11.81 for hemlock, white pine being given at $21.55 and spruce at $14.55. Ontario, which leads in many other commercial enterprises, leads also in the value of its lumber product, the other provinces coming in 1909 in the following order: Ontario, $30,050,344; British Columbia, $11,374,989; Quebec, $9,489,386; New Brunswick, $5,336,974; Nova Scotia, $3,273,177; Saskatchewan, $1,448,079; Manitoba, $1,025,265; Alberta, $798,320.

Ontario leads by virtue of its white pine, Quebec being first in the output of spruce and British Columbia in fir and cedar. These are the striking features of the output in a year of the chief wood product, and that which meets the largest and steadiest demand. Square timber, which was once a close rival of sawn lumber, seems from the export returns to have been produced in 1909 to the value of only $991,784. To this at 31.92 cents a cubic foot white pine contributed $655,784, red pine at 30.29 cents a foot, $134,633, and birch at 10.63 cents a foot, $148,105. Shingles were a greater factor than this old staple of the trade, being produced in 1909 to the value of $3,701,182, of which British Columbia's share was $1,627,624, while lath was turned out to the value of $1,979,034.

In spite of high prices, and the substitution of steel and cement for uses where wood once was the one material, the trade grows, and, in values at least, is likely to grow for years yet.

Consolidation of Lumber Interests in Pacific Northwest— Some British Columbia Firms to be Included

From Seattle comes the announcement that the three largest lumber associations in the Pacific northwest—the Pacific Coast Lumber Manufacturers' Association, the Oregon and Washington Lumber Manufacturers' Association and the Southwestern Washington Lumber Manufacturers' Association, are to be consolidated, and that W. C. Mills, of Globe, has accepted the management of the consolidated associations.

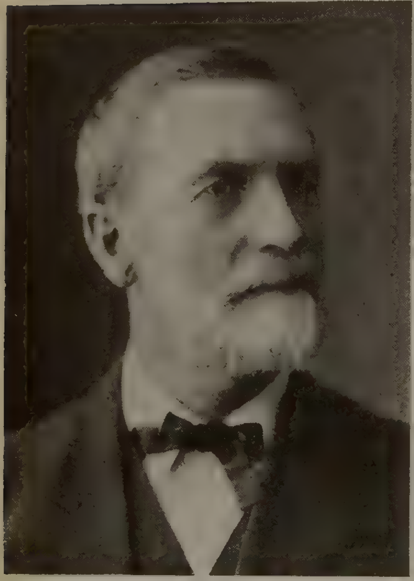
As a result of the consolidation all the Oregon and Washington firms, as well as a large number in British Columbia, who have been affiliated with local organizations, will be brought into one large association for the purpose of bringing about reforms in the lumber business which the various local associations have been unable to obtain. It has been proposed tentatively that the headquarters be opened at some point in Southern Washington, but that offices will be maintained at Seattle and Portland.

Shingle Manufacturers Organise

Shingle manufacturers representing the industry in thirteen counties of western Washington have completed the organization of the Red Cedar Shingle Manufacturers' Association. The association will act as selling agency for red cedar shingles. It controls the output of seventy-five per cent. of the straight shingle mills in Washington state.

Growth of Notable Woodworking Firm

Enviable Record of J. R. Eaton & Sons, Limited, of Orillia, Ont.—Widespread Trade in Lumber Products Developed Out of Small Contracting Business



J. R. Eaton, Orillia, Ont.

One of the best known firms in Ontario, devoting their attention to the manufacture of doors, sash, frames, mouldings, hardwood flooring, etc., is that of J. R. Eaton & Sons, Limited, of Orillia.

The founder of this firm, Mr. J. R. Eaton, has long been acquainted with the lumber industry in Ontario. He was born in the County of Antrim, Ireland, in 1852, and the family moved to Canada in 1853, settling in Huron County, where they engaged in farming for several years. In 1868 they moved to Detroit where Mr. J. R. Eaton, then a young man, learned his trade, as a carpenter, and soon commenced a contracting business. Five years later Mr. Eaton moved to Orillia, where he took up the business of a building contractor. Being a keen business man, with an eye open to the development of his opportunities, he concluded that a planing mill could be conducted to good advantage in connection with his contracting work. He therefore bought a factory standing on the site of the present extensive plant of J. R. Eaton & Sons, at the corner of Andrew and Colborne streets. He quickly became very closely identified with the building trade in Orillia, and its vicinity, and had charge of the erection of many splendid dwellings, stores, churches, etc. His reputation for thoroughness and satisfactory dealing quickly extended the area of his business and it stretched out far to the north along the lines of the Grand Trunk, and Canadian Pacific Railways.

In the course of time Mr. Eaton's business in connection with the planing mill and sash and door factory grew to such an extent that in 1907 he found it advisable to give up the contracting end of his work, and devote his entire time to the factory. A few years previous to this he had commenced the manufacturing of end-matched hardwood flooring, now so widely known under the name of "Empire Brand." The distinctive features of this flooring are its splendid grading and careful manufacture, which contribute greatly to economy of time in laying. This branch of the business grew rapidly and in addition to the regular line of stock goods it was found advisable to manufacture the better class of finish in hardwoods. The experience which Mr. Eaton had gained in the contracting business then stood him in good stead, being conversant with construction and detail work, he was able to work out details in the most satisfactory manner.

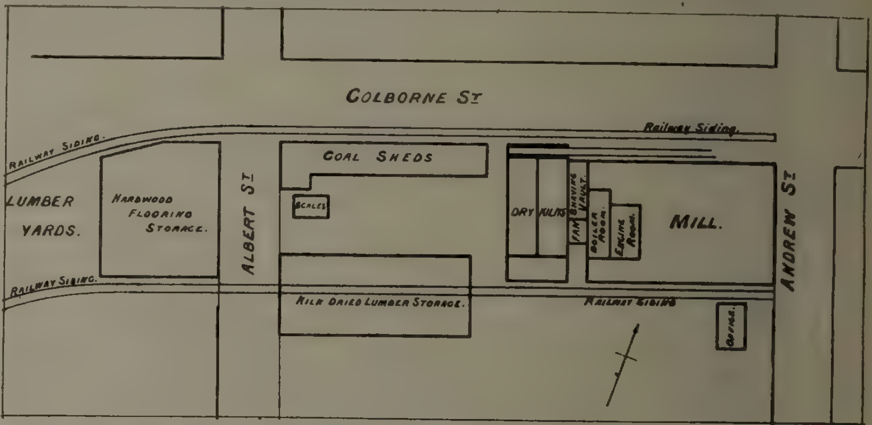
E. R. Eaton, Orillia, Ont.

J. H. Eaton, Orillia, Ont

In the year 1908 Mr. Eaton took into partnership his two sons, Messrs. E. R. Eaton and J. H. Eaton, who had grown up in the business. In 1910 a charter was secured for the company, which is now known as J. R. Eaton & Sons, Limited. The offcers are as follows: President and manager, J. R. Eaton; Vice-President, E. R. Eaton; Secretary-Treasurer, J. H. Eaton.

So rapidly has the business developed that it has been necessary to enlarge the building and plant from time to time. These now include a large amount of the very latest equipment and machinery, together wtih large store shed capacity and lumber yards, covering several blocks. Railway sidings which run through the yards, connecting with the factory, enable the company to handle their stock with great economy, and carry on, under satisfactory conditions, a large amount of transit dressing trade for the mills and lumbermen situated in the large lumber manufacturing district in the neighborhood of Orillia, and in the Georgian Bay country. The company have a capacity for transit dressing for several carloads per day. Their business in hardwood trim, stairs, veneered and pine doors, and all kinds of factory work for buildings is increasing rapidly and they are making regular shipments to the Maritime Provinces and to western Canada. Their business with the Prairie Provinces and British Columbia is growing extensively and their goods are becoming favorably known throughout the West.

Although they have now been in existence for many years and have grown to such a gratifying extent, the company do not by any means consider that they have reached the end of their development. They are watching every opportunity for further extension and from the numerous inquiries they receive from all parts of Canada, expect that further enlargements will be necessary in the near future.



Plan Showing Layout of J. R. Eaton & Sons' Plant, Orillia, Ont.

A fair idea of the excellent equipment which the company possess may be obtained from the following summary of the machinery and other facilities which they have already installed. In the first place their equipment includes a 225 horse power Tandem Compound Wheelock Engine, manufactured by the Goldie McCullough Company, Limited, Galt, Ont. Their hardwood flooring machine is of the latest design, manufactured by Hoyt Bros., of Aurora, Ill. This machine turns out flooring in such excellent condition that no time is lost in laying. For the manufacture of soft woods and for dressing in transit, the equipment includes heavy matchers and planers.

Among recent installations of machinery in the plant may be mentioned the following: Heavy Berlin Moulder, and a Berlin Resaw taking 7 inch blade, both being up-to-date machines of large capacity manufactured by the Berlin Machine Works, Hamilton, Ont. For mortising doors and panelling, a Chain Saw Mortiser has been installed which was manufactured by the New Britain Manufacturing Company, of New Britain, Conn. The equipment also includes a Dado Machine made by the same firm, which is of special value in filling large orders of frames, as it makes all the gains in each pair of jambs in one operation, the work being exactly uniform. This machine is also used in getting out tanks for various purposes. The J. R. Eaton Company make a specialty in this line, of the manufacture of standard water tanks for railways. An important and interesting machine is the Electric Routing Company machine for routing stairs, panelling pew ends, etc. A Turning Machine manufactured by the Woodworking Machine Company, of Beloit, Wis., has also recently been installed for turning out balusters, spindles, etc., in large quantities at low cost.

With such an equipment it is to be expected that the company would secure many important contracts. That they have taken advantage of every opportunity for securing business is illustrated by the following, which are only a few of the important contracts which they have recently secured. In the Lumsden Cummings Building, at the corner of Yonge and Adelaide streets, Toronto, a splendid 10-storey office structure, they furnished all the quartered oak finish and doors, and all the hardwood flooring. For the Prince Arthur Hotel, at Port Arthur, Ont., recently opened by the Canadian Northern, they furnished the interior finish, which is of birch mahogany. This contract included about 500 birch veneered doors. The company also supplied the entire factory work, flooring, frames, finish, stairs, etc., for the $100,000 Collegiate Institute and for the Y.M.C.A. building at Port Arthur, Ont. In Fort William they supplied the hardwood flooring and interior finish for the new Union Station which has just been completed for the C.P.R. and G.T.P., and also similar materials for the Presbyterian church and Masonic Temple in the same city. At present the company are getting out the entire factory work for the new Court House and for the Carnegie Library, at Fort William.

1909 Output of Boxes and Shooks

One Hundred and Forty Million Feet of Lumber Consumed in this Branch of the Trade

By R. H. McMillan.

The figures given in this report represent about 60 per cent. of the quantity of lumber used during 1909 by the box manufacturers of Canada, but do not include the large quantities used by the shippers of stoves, machinery, furniture, musical instruments, carriages, implements, plate glass, veneer and stone. Those who ship bulky articles varying so much in size and shape as those named above, find it more profitable to manufacture their own crates and packages.

The reported consumption of lumber for boxes and shooks for the whole of Canada in 1909 was 82,972,000 feet, valued at $1,264,376. In Table I. is a detailed statement of the number of mills in each province, the total quantity and percentage of the lumber used in each province, as well as its total and average value.

TABLE 1.

Province.	Number of box and shook factories.	Lumber Used.		Value of Lumber.

Nova Scotia	4	1,753	2·1	18,496	10·55
Canada	60	82,972	100	1,264,376	15 24

As boxes and box shooks are commodities that will not bear much expense for freight, it is natural to find that nearly three-quarters of the lumber consumption for boxes is reported from Ontario and Quebec, the two provinces in which are centred chiefly the manufacturing and shipping interests of Canada. Were the statistics for the box industry as complete for 1909 as those for other industries, a still larger proportion of the lumber consumed would have been shown to have been used in Ontario and Quebec, and Ontario, not Quebec, would be shown at the head of the list. There are still a large number of factories, in Ontario especially, and in Quebec from which no reports are secured. Allowing for the amount of lumber used by factories not reporting, it is probable that about 140,000,000 feet of lumber, worth about $2,100,000, is used annually for the manufacture of boxes. About 50 per cent. of this is used in Ontario, 30 per cent. in Quebec, and the remaining 20 per cent. in British Columbia, Manitoba, New Brunswick and Nova Scotia. Less than one per cent. is used in Alberta, Saskatchewan and Prince Edward Island, provinces where there are few manufactures and but little production of natural products requiring boxes for shipment.

TABLE II.

Province.	Chief Box Lumber.	Percentage it forms of total Box output.	Average sale price at mills of province. (1)	Average cost price at Box factories of province.
Quebec	Spruco	80·0 %	14·28	15·02
Ontario	Pine	67·5 %	22·33	14·97
British Columbia	Spruce	68·2 %	13·44	16·59
Manitoba	Pine	51·9 %	(2)	15·00
New Brunswick	Spruce	50·5 %	15·44	12·55
Nova Scotia	Spruce	80·0 %	11 98	11·19

[1] Bulletin 11—Forestry Branch.

[2] No white pine lumber is manufactured in Manitoba. The pine box lumber is imported—chiefly from Ontario.

Though Table I. does not account for all the lumber used in the box industry, it is based upon replies from sufficiently numerous manufacturers in each province to indicate the species and average price of the lumber used.

Table II. compares in each province the mill run price of the chief lumber used for boxes in that province with the prices paid for the same species of lumber by the box makers.

It is evident from a study of the prices given above that though boxes, because of the short life and light service usually expected of them, may safely be made of cull lumber and mill waste, this practice of utilizing low grades is not as common in Canada as it might profitably become.

In Quebec and British Columbia, box lumber commands a higher average price than all other lumbers, and in Nova Scotia the spruce used for boxes almost equals in price the spruce of all grades on the market. The only explanation of this is that in these three provinces, two of which, Quebec and British Columbia, are large producers of box lumber, cull lumber or waste material is not used for boxes. In Quebec four-fifths of the boxes are of spruce; there is little or no competition from other woods; the trade has become accustomed to clear sprue boxes, and though for the greater number of boxes manufactured cull lumber of several kinds would do—spruce, balsam, poplar or pine—this lumber is wasted and good grades of spruce are used. In British Columbia the waste of timber is more flagrant. Although only about 6 per cent. of the lumber cut in British Columbia is spruce, two-thirds of the boxes manufactured are of spruce. Other woods suitable for box making in British Columbia are Douglas fir and hemlock, of which large enough quantities are wasted in the sawmills every month to manufacture all the boxes used in the province in a year. But the utilization of waste timber has not been developed in British Columbia; the buyers of boxes have been educated to demand a high grade article, and as a result British Columbia uses for boxes spruce which has been selected at $16.59 per thousand from a market upon which all grades of spruce average $13.44 per thousand.

The two provinces where waste timber is utilized for boxes are Ontario and Manitoba, where pine forms two-thirds and one-half respectively of the box timber manufactured. White pine is the box timber demanded by the trade in these provinces, and as white pine lumber of the better grades sells at too high a price to make it available, the box factories use a large proportion of culls and rough material—timber which would otherwise be wasted.

Pine is yet the only wood of which lower grades are utilized to any extent in the box business. Manufacturers of pine boxes buy their cull material at about $15 per thousand; manufacturers of spruce boxes can buy good spruce for the same price, and can thus produce a box of first-class spruce as cheaply as any one can turn out a box of cull pine. This fact tends to prevent the utilization of rough material or low grades of other species than pine, even though they may be well adapted for box manufacture.

In Table III. are shown the quantities of lumber of each species used in box manufacture in 1909, the pecentage each formed of the total, its total value and average value per thousand feet.

Table III.

	Quantity.		Value.	
	Thousand Feet, B.M.	Per Cent Distribution	Total.	Average per M.
Spruce	43,034	52·7	651,133	15·15

Butternut	70	0·1	1,340	19·14
Total	82,972	100	1,264,376	15·24

(1) Includes Cottonwood.

As well as supplying from 50 to 80 per cent. of the box output of four different provinces, spruce furnishes over one-half of the entire consumption of box lumber in Canada; the only other wood used to a large extent is pine, which forms 30.3 per cent. of the total. These two woods together account for five-sixths of the total; the remaining one-sixth is comprised of 14 different woods, of which basswood, poplar and hemlock are the chief.

The cheapest native woods used were balsam and poplar, which cost $9.82 and $11.29 per thousand respectively. Hemlock and ash were the only other woods which cost less than spruce and pine, the staples. The hemlock was nearly all used in British Columbia.

It has already been mentioned that great economies might be effected if as large a proportion as possible of lower grades of lumber—resawn slabs and other mill waste—were used in the manufacture of all boxes as they are now used in the manufacture of pine boxes. There is another economy in forest utilization possible to the box industry, and that is the utilization of species which are not now desired for other purposes, especially western hemlock and different species of poplar. Experiments have been conducted by the United States forest service which showed that for large and medium boxes cottonwood is stronger per unit of weight than New England white pine, and that for small boxes both cottonwood and western hemlock are stronger per unit of weight than New England white pine. (W. K. Hatt, in circular 47, U.S. Forest Service.)

The same experiments showed that western spruce, the favorite box material in British Columbia, is for large boxes stronger per unit of weight than New England white pine. In addition to these woods, there are in central and eastern Canada poplar and balsam fir, woods which are cheap, light in weight, light in color, of even grain, odorless, tasteless, of handsome appearance and fairly strong, and should therefore be satisfactory for most classes of boxes.

TABLE II.—Boxes and Box Shooks, 1909—The price of the chief box lumber used in each province compared with its average price at the sawmills of the province.

TABLE III.—Boxes and Box Shooks, 1909—Total quantity, per cent. distribution, total value and average value, by species, of the lumber manufactured for the box industry.

Keeping Track of Tools.

Tools and supplies of one kind and another put into the hands of employes by lumber manufacturers and yard men constitute one of the big items in the expenses account. There are a good many operators who keep a careful record of these items and know what becomes of them, and how long they last, but there are more who do not, and who continue to pass them out as asked for. In giving out tools and supplies indiscriminately they encourage carelessness, and in some cases, dishonesty, among the men.

It requires but little time, and no expense, to keep a systematic record of everything in the way of tools and supplies dealt out to those who require them in their work, and the time so spent often saves hundreds of dollars to the employer each year. Those who have introduced such a system have been astonished at the saving effected and find, as a rule, that the tools and other supplies last much longer than before.

Metal tools are stamped, and wooden handles branded to identify the owner. This is a protection against theft and against getting mixed with the property of others, but the greatest saving is affected by charging each item to the workman into whose hands it is put and giving him credit with it when it is returned. When a tool is charged to a man he takes better care of it and usually makes it last longer than when he is free to draw a further supply at pleasure. In practice the tool and supply record kept with employes shows a saving anywhere from 10 to 25 per cent.

The Day of the Small Mill

It is apparent from the report of the United States Bureau of Census that instead of the small mill being a passing factor it is one whose importance is increasing steadily, says the American Lumberman. Lumbermen consider mills cutting less than 2,500,000 feet annually to rank as small mills. In 1909 operators of such plants produced 36 per cent. of the lumber supply.

To include the cut of mills producing more than 2,500,00 but less than 5,000,000 feet increases the percentage of the product to 45.1 per cent., leaving only 54.9 of the cut to be supplied by plants turning out 5,000,000 feet or more.

Mills cutting more than 50,000,000 feet are the exception. The census shows 36 mills of this size, and these 36 institutions produced annually 5.6 per cent. of the cut. Mills turning out 15,000,000 to 25,000,000 feet produced the greatest percentage of the total supply, 14.2 per cent., and were closely followed by the class cutting 25,000,000 to 50,000,000 feet. The mills in group four, turning out 1,000,000 feet and more, but less than 2,500,000 feet, rank third in quantity of cut, 13.5 per cent. The mills cutting less than 500,000 feet rank fourth. There were 28,459 producing saw mills in the United States in 1909, whose total cut was less than 500,000 feet. The aggregate cut of all such mills was 12.5 per cent. of the total lumber production.

The figures show a considerable increase in the number of plants whose products range from between 5,000,000 and 50,000,000 feet, the gain being 37,3 per cent, bringing the total number of such institutions operated in 1909 up to 1,635.

This statement constitutes a terse and satisfactory explanation of many things. This 55 per cent. of the product is manufactured by 1,671 mills located in 40 states. It includes every variety of lumber produced in this country. It shows the absolute impossibility of combination and explains also why it is so extremely difficult, during periods of quiet demand, to prevent competition for trade between these 1,671 producers and as many or more wholesalers, demoralizing market conditions.

Wages—Their Proportion to Value

Interesting Government Tables Giving Statistics in Lumber Producing and Consuming Plants

An interesting series of tables dealing with the proportion of wages to value of product, in a number of leading industries in Ontario, has recently been issued by the Provincial Labor Bureau in its annual report. The tables relating to the lumber industry are reproduced herewith, and they will repay careful study. The schedule numbers refer to the individual establishments reporting.

In connection with the above tables, it is interesting to note how closely the average figures approximate to the average of all the industries which reported. The general average as given in the report showd that in 642 establishments a total of 49,090 persons were employed. They were employed on an average 290 days in the year. Their wages amounted to $21,392,444. The gross value of their product was $111,392,169. Their average annual earnings were $452.15. Their average daily rate of pay was $1.58. The average percentage of their wages to the gross value of the product was 26.66, and the average percentage cost of material, interest, insurance, taxes, etc., and profit was 73.34.

Pulpwood owners in the Province of Quebec believe that they see indications of an approaching awakening of the demand for pulp and pulpwood. A few years ago the United States mills reduced their demand for Canadian products greatly and it has not yet revived to any great extent. Reports from Sherbrooke, Que., now state that there are 200,000 cords of pulpwood at least, cut and ready for shipment, in the Province of Quebec. The indications now are that there will be a revival during the coming summer and fall and that next year a lively trade will again be in progress.

Sixteen hundred miles of fire guards in western Saskatchewan will be built under government supervision this year. One important new guard line will connect with the old guard south of Morse, and continue to the border. This will protect a district which was largely burned out last year.

◆

Winnipeg—Large Lumber Consumer

Interesting Details of Quantities of Wood Products Used by Prairie Province Capital—An Important Market

Winnipeg has a population of 200,000. It uses 100,000,000 feet of lumber annually. No lumber is manufactured near this city.

Naturally, in getting to its present stage of growth, Winnipeg has had some problems to solve, among them not the least interesting has been the question of a sufficient supply of lumber for building purposes. There is no timber of dimension size within—roughly speaking—two hundred miles of Winnipeg. The Riding Mountains—150 miles northwest of the city—have some timber, and the Rainy river district, about 200 miles east, is a place where a good annual cut is made, but the call of the Winnipeg builder is loud, steady, imperative and demands lumber, more lumber; all the lumber that can be had, in fact. In seven years, Winnipeg has put $69,284,305 into new buildings, last year's figures alone being $15,116,480. Buildings of brick and stone ate well into these amounts, but there were still many millions put into frame buildings, the bulk of the houses built in Winnipeg being of the frame type. Last year 1,375 frame dwellings were built in Winnipeg and of course a great deal of lumber was used in putting up other buildings—3,916 in all. 570 were shops, stables, sheds and the like, and 150 were stores and garages, many of them of wood construction.

These big building operations put it up to the lumber man to get big stocks and great variety of material. He does this by going to different places for what he wants. Last year's building operations in Winnipeg took 85,000,000 feet of lumber. Five per cent. of this was spruce, 25 per cent. was pine from the timber country east of Winnipeg, and the remaining 70 per cent. came from British Columbia and the United States. Hardwood lumber is outside of these figures and all comes from the United States.

There is some spruce cut in Manitoba. From Dauphin, north and west, along the northern line of the Canadian Northern, there are ten or a dozen lumber camps and they do a fairly good business; indeed the combined season's cut of the camps operating between Dauphin and Prince Albert, including one about 60 miles north of Prince Albert and one at the Pas Mission, for 1910-11, will run not far from 125,000,000, practically all spruce. The nearest of these points to Winnipeg—Dauphin—is 178 miles away, and the cut around Dauphin is light, timber is small and the area limited.

There is some timber around Lake Winnipeg too, but not enough to be a considerable factor in the Winnipeg market. This is spruce, too, and principally small stuff. The streams that empty into the lake on the forest sides are not good logging streams and the lake itself —some 9,460 square miles in area—is unkind to such things as rafts. It is a shallow lake and is often very rough, so that tows of logs are awkward to handle.

East of Winnipeg, in the Rainy River district, there are some good sized mills and the winter's cut in this section, this year, is placed at 150,000,000 feet. This was spruce and pine and rather considerably the latter. The Rainy River district suffered severely from fire last fall and not only a great deal of standing timber was destroyed but towns were burned and sawed stocks as well as one or two sawmill plants. The winter brought plenty of snow and the lumbermen have been busy, clearing up as much of the scorched stuff as possible so that the cut of logs for lumber has been accompanied by great activity in pulpwood, railroad ties, poles and piles. Altogether about 5,000 men have been working in the Rainy River district through the winter, and their wages alone have amounted to half a million dollars. Rainy River produces some good logs. They are cut shorter than the British Columbia logs and do not run over 16 feet as a rule, but they turn out boards 18 inches wide and reasonably clear.

The prairie provinces, generally, eat up lumber very fast, and the amount used in Winnipeg, large as it is, is only a small part of that which pours into the block of land that lies between the Great Lakes and the Rocky Mountains—approximately a thousand miles east and west and four hundred miles north and south. There is no other city of the size of Winnipeg within these limits, but there are some good sized cities, such as Calgary, 45,000 people; Edmonton, 30,000; Saskatoon, 15,000; Regina, 17,000; Moose Jaw, 15,000; Lethbridge, 13,000; Brandon, 13,500; and a host of smaller places that are making building history faster than it was ever made before in the world by towns which stay on the map. Twelve of the largest of these prairie towns put $33,617,132 into new buildings in 1910, an average increase of 60.1 per cent. in four years, one city—Prince Albert—going as high as 386 per cent., and seven of the twelve running over 100 per cent. beyond their 1907 figures. Some idea of the growth of this great section of Canada—the richest in all the Dominion—is to be had from the fact that the Canadian Pacific Railway will start 50 new towns this year. The Grand Trunk Pacific Railway will build 140 new stations west of Winnipeg, and the Canadian Northern and Canadian Pacific will spend a total of $26,000,000 on new lines and equipments for them during 1911.—C. F. Roland, in the West Coast Lumberman.

THE WOODWORKER

Memoranda of a Machine Woodworker

It seems to read all right, this thing about the saving of kerf to a band resaw, and it is in many cases, but there is a great deal of the advantage lost on account of parsimonious buying at the start, says H. C. H. in Wood Craft. When a machine is under consideration, all makes are looked up, all sorts of questions are asked, all sorts of prices are obtained, and the shrewd (?) buyer, in a recess of the private office, figures it out on the "price per pound basis." Wonder how it would work to follow out that line in selecting men for the factory? I know of a case where the driver of the sawdust cart would be getting a big salary and the credit man of the concern would be working for about sixty cents a day. Aside from all consideration of the fitness or worth of the machine in view of the price, the squeeze-down commences as soon as the contract for the machine has been signed. There is many a filer who, rather than have to be a supplicant for an outfit as a favor to him, has bought tools for the file-room that the mill should have bought. I have often seen money wasted with a cheerful face, that would have caused a mill man to have a fit had it occurred in the file-room, but the constant leak and waste due to inferior tools, or in many cases to the utter lack of them, escapes his notice altogether.

Ice cuts easily with a saw or knife; gum lumber cuts almost as easily when it is steamed, but a frozen gum bolt that has been steamed only enough to get the frost out seems to be as tough as an old shoe sole. During a frosty spell I saw three machines broken in trying to cut staves from bolts that had not been steamed sufficiently.

One good way to get the best there is in the shop in the matter of work or positions is to try and give the best we have in us. It is an investment that often brings big returns.

An oilstone lying around loose on the bench attracts dust and remains in poor condition for work. A little kerosene will keep it clean and in good condition and it takes very little time to do the trick.

Saws and Files.

A dull saw may not be a sign of dull wit, as it may be due to hard work, but the using of a saw while it is dull is the sign of want of attention. A fairly good rule to go by is that of a dull saw being a dangerous saw. A dull saw will catch and kick quicker than a sharp saw, just by reason of its dulness. A few moments with a file may save some ugly jolts from a bench-saw or a boxboard table-saw, for instance. Where work has to be sawed by hand, sharp tools go a long way toward making it easier.

It is better to walk around a saw-table twice than to reach over it once. The difference between a saw and a mule is that a saw kicks out in front and a mule kicks out behind, both with equally disastrous results. It is safer not to reach over either one from behind.

No man ever gets all the machinery he wants, for if he did he would have no place to put it and most of the time would not know what to do with it. Special machinery for special work is all right in large factories, but the small factory can better afford to change oftener.

Accidents and Frolic.

Cracking jokes in the shop is bad practice; it leads to neglect of proper caution and later to accidents. Nailing a pair of shoes to the floor is funny, but a shaper man I know laughed so much over it he forgot to hold his work properly and the straight cutters took half of his hand as a reminder. Blood poison did the rest, and now the poor fellow has gone where wood is not used, presumably.

Things will go wrong at times, and it is of small use to work one's self into a passion. The natural order of things will get one there soon enough in our line of work. Better cultivate the habit of keeping cool, or as cool as you can, anyway.

If a man is a good engineer, he takes care of his engine. If he is not so much of an engineer but has managed to get the job, he takes care of the job, and there are many ways of doing that besides taking the best of care of the engine. The party field is not the only one on which the game of politics is played.

If you want to start a small bolt or nut, use a big wrench—that is, if you do not care what else you start. You might start something you can't stop so easy, but lots of people don't seem to mind that. Many of the broken bolts and cap screws are simply the result of too much wrench and too little judgment. When a bolt or nut won't come loose with a proper size wrench, look for the cause and don't try main strength and awkwardness. Many a man has been fooled by a left-handed thread and the left-handed monkey wrench boy is not always around to send for the tool supposedly made for that purpose.

We are sometimes advised to humor a crank, but all of us are not built on humorous lines. I have a faculty of butting into these cranky people, and my experience with them is that it is as well to have it out with them at the start as it is to fool away any time with their vagaries. Life is too short and work is too real and earnest with me to give much attention to cranky people in this business.

A machine running empty is a double waste, both of time and power. It is money taken from the profit account and credited to loss in a double ratio. Every difference of an hour means two hours lost time. Taken from one account and added to the other makes the double difference.

Economy in Grinding.

Just a little carelessness in holding a cutter in grinding will undo lots of careful work in making and tempering. I often wonder why it is that so many mill and factory men are so short-sighted as to put up with any sort of an old arbor for an emery grinder stand. I recently had the ordering of a set of file-room tools and the common grinder was one of the tools that did not get into the outfit. I got the best made, as far as I could tell, and believe it was money well spent. Many a tool is spoiled in the grinding and tools cost too much to get made right to be spoiling them in this fashion. A few dollars more on a good grinder means a good many saved in the cost and life of tools.

There is no particular saving grace in letting the water get low in the boilers and we had to let one of our firemen out for this method of trying to save. He thought he would use less if he did not use so much in the boilers, and he is now at a job that does not involve quite so much brain work.

Many of the emery wheel accidents can be traced to carelessness somewhere, either in the mounting of the wheel or from allowing the tool or piece being ground to slip between the wheel and the rest. Mounting an emery wheel is a good deal like hanging a circular saw, inasmuch as the wheel should have a plain mark on the paper around the eye, and if the wheel is changed, always hang the mark up when replacing so it will be always in round or nearly so. An emery wheel should never fit the mandrel tight. Always allow room for expansion to the eye. The slightest find to the wheel is apt to cause a fracture and burst it under ordinary working conditions. One more prolific cause of trouble lies in having the wheels get out of round for want of dressing, which will cause the journal to wear flat, and no amount of care will then get a wheel in good condition for work and keep it so any length of time. It is better to wear off a little of the wheel occasionally than it is to let it run out of a true circle. In the latter case the grinding is difficult and poorly done, a condition that is often noted in wheels for hand grinding. On the automatic machines, the work and wheel are both held steadily and joint off the wheel in the work, but with hand work conditions are entirely different, and some means must be employed to keep the wheel as nearly true as possible to get the best results.

I was much interested in reading of a mill in which the boss and all the men formed a compact and agreed not to swear or use profane language under any conditions. That was probably easy enough where all were so minded, but it is really an anomaly to find a mill man who would give up the gentle art of cussing under certain conditions, especially when there are times in this business when a man feels as if it would be more to the point to hire someone to do the cussing, so contrary do things go at times. Still, it does not mend matters, it is true, but it does seem as if it were, as a mill foreman once told me, that he "had to cuss or bust" when things went so very much wrong.

Surface and Belt Tighteners.

Once in a while we find a surfacer or matcher made with tighteners on the top cylinder belts. On three different occasions the writer has taken off these tighteners, each time being on a machine that was made to dress less than 15 inches in width. I took them off because I consider them an aggravation and a belt destroyer as well as having a tendency to provoke carelessness and hot boxes. From this it can be seen how operators differ on what are regarded as essential points. I run my belts as slack as they will run and do their work. With pneumatic pulleys and wide faces to get belts as wide as the driving pulleys will carry, this means that the belts are frequently run so slack thty almost touch when under full duty. But as I believe in keeping my belts in good order and pliable it may account in a good measure for my ideas on the slack belt question. Many machines are designed with the driving belts too short, and this defect has to be overcome with a tightener, but a fair length of belt never gives me any trouble about slipping. One of the strongest claims put forward for our more modern machines is the provision made for good length of driving belts to the cylinders and in the case of matchers, this means good length to the sidehead belts. I have never had any trouble to make a machine do as much as its makers claimed for it, and in some cases have done more than was claimed as within its capacity, which illustrates the saying that "it depends a good deal on who aims the gun as to how true it will shoot."

There is a great difference of opinion as to the merits of having the line shaft under the floor or mounted overhead. One is very apt to be influenced by which way he has been used to when called upon to pass judgment on either. I have been building a mill with the shaft under the floor, which mill when complete will have a capacity of 50,0000 feet a day. I have always been in favor of having the drive shaft overhead, and while I am ready to concede that there are many excellent reasons for mounting the shaft below, it is a close place and a tight fit all around.

A Mill and its Loading Facilities.

One of the strong claims for this system is low cost as compared with the overhead system. That does not hold good all the time, for this one reason—this plant is on the side of a hill, with an incline of 6 feet in 50, and as the plan shows bents or framing in the foundation, it required 17 excavations, 54 feet long, averaging 48 cubic yards of earth, that had to be wheeled 200 feet away from the mill site; and to make room for the shaft, engine, edger, countershaft, cut-off saw and its counter, required an additional 620 cubic yards.

The building is at the ground level on the high or upper side and the floor level is 34 inches above a car floor level on the lower or loading side. This of itself is not a fault, as down loading is preferable to level or upgrade loading. That is speaking from a loading view of the matter. But as all of the lumber comes to the mill in the rough, and is first dried, then ripped and dressed, and has to be unloaded from the same track level, it begins to look as if it might not be quite so handy. More particularly is this the case when lumber to be dressed will be large dimension stock, car sills or timber

It has been suggested that the track could be higher, but the railroad people will not put cars on a switch that has a down grade to the main line, so that is entirely out of the question. Nor would it do to have the mill machinery in a pit in a country where the rain sometimes falls so fast that it will almost make a flood on a hillside and the soil is so sandy that if it puddles ever so little will wash off in a body. As to cost, I think the excavating more costly than the slight additional cost to make the roof frame strong enough to carry the shafting. This roof span is 54 feet in the clear without a post, except directly under the exhaust fan.

The engine has a six-foot drive wheel that just clears the floor one inch and is one inch clear of the ground. With the exception of being in close quarters the engine is in a good position, compact and solid, but will have to take steam from a line of pipe 90 feet away from the boilers. There will be a main from the boilers, of four-inch pipe, which is 60 feet long to a line from the engine to the kilns, leading back 30 feet to the engine. This line of pipe to the kilns is 170 feet long. This will mean excessive condensation if exposed and a good deal of expense to cover with the usual commercial covering. To get around both of these things, I am going to box this pipe all around with a rough box, two inches on all sides greater than the external diameter of the pipe, and fill in the box with a mortar made of slacked lime and sawdust. I have used this composition repeatedly and found it almost invaluable where long lengths of pipe are exposed and can be reached with a cover such as an ordinary box. The box should have a cover to prevent wear from exposure to the action of wind or water or from contact by walking on it or otherwise disturbing it.

A covering of this sort will allow just enough warmth to get through to be comfortable to the bare hand with 125 pounds' pressure on the boilers. It is also a first class covering for the tops of boilers instead of layers of brick, which are of little benefit. It can be put on at any time, with the pipe hot or cold, and its by no means least recommendation is its cheapness, costing nothing but the lime and the box and little labor of shoveling it on boiler tops or around the pipe. Put on with the least attention to care in making a reasonably tight box around it, and it is one of the most effective insulators and non-conductors that I know of for the purpose.

In furniture work and in veneering of all kinds, the main thought is for the outside, provisions for the inside taking into consideration more the matter of body and the retaining of shape and form than anything else, says the Wood-Worker. In furniture making, no matter how fine the outside may be made, there is too frequently a neglect of the inside, not only as to the employment of the cheaper woods, but also in joinery work and in finish. It has been suggested heretofore that more attention should be given the inside work, not only to make it substantial, but it should be covered with a coat or two of varnish or shellac, to secure it against the absorption of moisture and the illeffects resulting therefrom. In making veneer panels it is quite a common practice to make the face of whatever wood is desired and the back of whatever wood is available. This seems to work alright sometimes, and at other times there are complaints that a panel faced with one kind of wood and backed with another, warps or does some things it ought not to do. It would really be better if both the inside and outside of panels or other pieces of veneered work, could be covered with the same kind of wood. If the face is oak, make the back of oak too. It gives it a better appearance, and when inspected inside and outside, gives the oak impression all over. Then it furnishes a wood more likely to balance up in the tendencies to swell and shrink, in strength and in various other ways. There is generally, too, enough low grade oak to furnish this backing, out of culls from the face stock, so it really need not add materially to the expense of the work. It may sound differently when it comes to mahogany both inside and out, yet whenever it can be done reasonably it would seem to be better. There is some low grade mahogany as well as low grade oak, and even while low grade mahogany costs more than poplar or some other backing, it would seem to be worth the while and the additional cost to get the appearance of mahogany both inside and outside, of work of a character and value calling for the use of mahogany. In short, it seems that the inside of work should be made, so far as practical, to harmonize with the outside. It needn't be of the same grade nor of the same high quality; it doesn't need to be polished, but it might more frequently be of the same material and give enough more satisfaction thereby, to make it well worth while.

Fire Protection for Woodworking Plants

One woodworking association has a committee on insurance which has prepared a card with prominently printed instructions for proprietors, superintendents, foremen- and- watchmen, says Wood Craft. These cards are being distributed locally but deserve a larger circulation. The committee advises that a copy of all fire-prevention instructions given to superintendents, foremen and others be sent to neighboring plants and any local bureau having to deal with this branch of insurance. The printed instructions are as follows:

All departments to be clear of refuse of all kinds.

Water barrels to be kept filled with water, and fire buckets put in their places. These barrels must not be covered at any time. Water to be changed when it becomes impure.

Sand boxes to be kept filled and shovel handy at each box. Extra bucket, filled with sand, ready for use, to be set on top of sand box.

See that all fire extinguishers are in their proper place and are in working order. The complete equipment of fire extinguishers should be tested once a year, one or more each month.

All fire hose to be taken out and tested twice a year, and if any repairs are necessary, report to office.

All rags or refuse must be kept in standard metal waste cans, and these cans to be taken by elevator man to yard before the machinery stops, and must be removed from premises the same day.

Use spittoons made of metal only, and never to contain any sawdust.

Gasoline, naphtha, or other volatile oil, should not be kept in building.

Gas brackets must have stiff fixtures. If it is necessary to use swinging brackets, all exposed woodwork must be protected with sheet metal, leaving an air space.

All waste must be hauled away from premises each day.

Each floor should be kept separate by fire doors to avoid drafts.

Have sheet iron cupboards with doors and latches for the hanging of clothes for each man.

All electric wires must be drawn tight. See that the porcelain cleats are in perfect condition, and insulation is in good shape on all wires. Where wires go through partitions or walls, wire should be reinforced by using fireproof tubing or porcelain tubes. All electric wire joints must be brazed or soldered where connection is made. Lamp cords must not be hung on nails or wrapped around piping. Paper shades must not be used. Lamps must not be suspended by light twine.

Stairways must be kept clear at all times, and swept down once a week and refuse taken away.

Aisles and space around fire extinguishers must be clear at all times.

No stock allowed in front of windows to interfere with firemen in case of fire.

Fire doors and shutters must be closed every night. Stock must not be in the way to hinder the ready closing of these fire doors.

Instruct your watchman that if a fire should occur, prompt action must be taken, and impress upon him the importance of keeping cool.

Each foreman to inspect his department at quitting time each day and see that everything is left in good order.

Each foreman to go over these items carefully and see that these instructions are carried out, and report to the office or superintendent if anything is lacking.

Make an appointment with your night watchman once every 30 days for a 15-minute talk regarding the condition of the factory—he may offer some suggestions of benefit.

Issue instructions to each foreman four times a year, on the 1st of July, October, January and April, cautioning them to keep everything in order, and see that all fire apparatus is in the best of condition. It will not take 15 minutes a day four times a year ,total, one hour) to dictate these instructions to the stenographer, and go a little farther, and issue the first of every quarter an order to your superintendent to go with you on an inspection trip to see for yourself that everything is in good shape.

The Retail Dealer and His Problems

Equitable Terms for the Buyer and Seller

The Buyer and the Seller*

By J. E. Lane

This subject seems to have caused a great interest among both buyers and sellers. When one has read with interest both sides of the controversy as they appeared in the trade journals, he would imagine that all that could possibly be said from the standpoint of each had been thoroughly threshed out in the last three months.

I will not attempt to go on record as stating just what would be "Equitable Terms of Sale" for both, as both sides of the question have merit, and I will only try and reason out how equitable terms to both can be brought about and have harmony and friendly business relations cemented together as of old.

It matters not how, or by whom, the buyer or seller, this controversy started, it has almost caused an eruption in the ranks of these two parties who represent the foremost business men of the age; men whose business takes foremost rank in the commerce of the world.

We can only realize the magnitude of this subject when we note, only a few days ago, the very foremost men of our nation, in a controversy which has practically caused an eruption between our distinguished President and his staff, in which the difference of opinion and their inability to see find this man, who in a few years has become so prominent among us and in whom the whole country at once became interested, as his work was one of interest, both to this generation and generations to come, in the great noble work of showing American people the necessity of conservation of our fast diminishing forests. From here we arrive at the starting point of the question of the new "terms of sale," for as soon as Mr. Pinchot assumed the office of chief forester, he commenced to show the public, by facts and figures, the necessity of conservation, and this caused the men who operated a large lumber plant to note, by facts and fifures, the loss each year at his won plant, and at once he commenced the practice of the art of conservation. In so doing, he could figure by manufacturing odd lengths, in the finished product, he could add his small saving to the large list, and in this his mind followed the main channel of conserving, and he came to realize that not only conservation in manufacturing was necessary, but the slogan "conservation" was the main issue and why not move it along the line and sprinkle some of this good mixture in with the selling end.

When his mind became agitated, he became imbued with the revised theory, and thoughtlessly framed up what he thought was a proper "term of sale." One that would naturally better conditions. The old system has been in vogue for years and as your progressive American spirit impelled us ahead, no one looked for the breakers ahead, met with his fellow manufacturer or seller and seemingly without due consideration for the other side, introduced what became known as the "terms of sale." Had there been only one side to this and had there been only one terminal head to the disposition of this immense output, this new "term of sale" would have met with only a few comments; but the buyer reads the trade journals and at once sees where his interests and his dignity are being trampled on, and as his money purchased the article, he should have a say as to what constitutes a "term of sale" between himself and the seller. He at once expressed his view through the trade journals. He likewise meets with his friend, the buyer. The matter goes to the local association meeting, drastice resolutions are introduced.

The secretaries of the manufacturers, through columns of the manufacturer's journals, wrote long and interesting articles. The same can be said of the dealer's associations. After every point that could be raised had been thoroughly discussed and all weighed and placed in its proper place, we find some profitable lessons have been learned. New ideas, unthought of heretofore, had come to light, each and everyone had come to realize that each man or firm were equal, and all stood one the same ground as representatives of one common interest, all dealers in lumber. One takes the raw material and manufactures to sell to dealers, the other the finished product to sell to the consumer. What is beneficial to one should be beneficial to the other, when the end means the same to both, namely, securing our "daily bread" for ourselves and families and trying to accumulate a fair and reasonable profit from honorable commercial activity.

In years gone by, and I think you will agree with me—in all the millions of dollars involved in the purchase of lumber, this matter of terms of sale, as such, has never entered the mind of either the buyer or seller in a serious way nor otherwise than a friendly and agreeable manner, the seller stating "You can purchase one car of this at so much, figuring the cost of production, adding a reasonable margin of profit and freight to destination; then, at your option, sixty days after date, pay us in full less expense bill, or five days after arrival of car deduct 2 per cent." As soon as the car arrives, is unloaded and inspected, as near as the average retailer is able to judge as to grade, it is checked over and the buyer uses his option as to payments. This has been the going custom for years, neither buyer or seller offended; each looking forward to the interests of the other, for neither can prosper without the support of the other.

When times are good the seller takes advantage of better prices, and the retailer does likewise rejoicing that his friend, the manufacturer, prospers and on the other hand the manufacturer seeks out and looks with favor to the prosperous retailer.

The seller or manufacturer while under a heated passion may remark that he can sell direct to the consumer and can establish yards at various points and eliminate the dealer. But the dealer, being in the field, has proven to be the "Trail Blazer" and the forerunner of our enterprising and progressive country, helping on every hand to promote and develop every industry that goes to make up a commercial community.

On the other hand, the buyers of to-day could say: "We can buy timber, erect our own mills and manufacture our own lumber." This has proven to be just as impractical, since the amount of money that would be involved would be heavy, while the greater portion of lumber sold to-day to consumers is handled through great line companies, who control unlimited capital. And, by the way, a great many of the large owners of line yards are also owners and operators of large manufacturing plants. In addition to all this is the mail order house which needs no mention, as every buyer and seller of to-day is familiar with this factor of the business.

"Terms of sale" between buyer and seller should be framed with some elasticity, as supply and demand are the main factors to govern. When prices have an upward tendency and the seller has a ready market, he is in a position to dictate terms which are usually satisfactory to the buyer who is anxious to have his order placed with all haste possible, and, as business is usually good, prices are more satisfactory. But when business becomes dull and trade begins to lag, customers are not anxious to buy, and when he realizes that his time is not at all valuable, he begins to inquire in different directions for prices. The dealer or buyer does likewise, and the manufacturer or seller, who is anxious to sell his product, is ready to make almost any terms to suit the buyer. There has been no exception to this rule in the past, and will not likely be in the future. My theory is to let the seller make such terms to the buyer as would better suit his conditions. It should be the option with the buyer to accept or reject his proposition. It should also be the seller's option to manufacture or handle any product he may see fit, whether they be odd lengths, long lengths, or poor grade, it makes no difference. It should be his business to find a market, and on such terms as he should deem best for his community. There has always been a market for everything, and it remains with the seller to establish his trade. There has always been buying, and it remains with the buyer to buy where he can make the best terms, and so on through all kinds of business, supply and demand is the rule and will continue to govern.

After all has been said, and after each side has thoroughly aired its side of the question, in what would be fair to all, and when we all come to realize that each side needs the co-operation of the other, that the good warm handshake was the same as of old, that we cannot expect to have years like 1907 for the seller, where almost every one thousand feet would bring a premium of one to two dollars in order to get the material, or years like 1909, for the dealer or buyer, where he sells at about the same prices as when lumber was at a premium, all will equalize. Exorbitant prices cannot be carried on successfully betwen dealer and consumer any more than they can between manufacturer and dealer. When we have poor years for profit we should try and improve on the next, and not give vent to our feelings and envy those who have had more favorable conditions.

I doubt very much if many manufacturers made but very little over and above a fair margin of profit, during the reign of high prices in 1907, and I doubt very much if there are many dealers today making other than a reasonable and fair margin on his investment for competition is bound to govern prices.

It should be the duty of both buyer and seller to throw off the independent attitude and meet the situation face to face, with those directly interested. When this is done we can feel assured that the present attitude of both buyer and seller will be reduced to an equal basis. Instead of trying to "kill the goose that lays the golden egg," discuss the matter both pro and con. I know from my evperience—and I think from the experience of most men present, when this is done, the desired result will be accomplished and we will go on, hand in hand, as in the past, for there will always be buyers and always be sellers.

I believe that this would be fair for both, and know that deep down in the minds of each there is no attempt to take advantage of the other. These little differences will come up in the future, as in the past, under any "terms of sale" that could be put into practice, and the only selection that will prove a success morally and financially between buyer and seller is to get together oftener and thoroughly discuss both sides.

---

*Address before the convention of Western Retailers

The buyer should recognize the immense investment contained in a manufacturing plant; the risk of fire to the plant and timber, also that from the time the tree in the forest is cut until he receives his cheque for the lumber from the dealer, it is from six months to one year. Few retailers realize the adverse condition of the manufacturer and, while we all know that the retailer in some cases abuse the "terms of sale" and discount the bill 30, 40 and sometimes 45 days after dating, and in some cases takes advantages of his opportunity to lower the grade, yet, in fairness to both, instances of this kind are few, and the high class, as a rule, of both manufacturers and retailers, will not warrant criticism and condemnation of all concerned for the unbusinesslike manner of a few.

In conclusion, when the storm has blown over and after reading the different articles, some will say, "This one is radical." But at these meetings you meet this one or that one, who sold you poor lumber that was under grade or who charged you exchange on the check you sent him, or who took 2 per cent. discount at 45 days, and these little differences must be cured.

At meetings like this one at Portland, where manufacturers and retailers alike meet on the same ground, we forget the troubles that we have had in the past and can realize that the glaring head-lines in the trade papers, which woke us up from our slumber, only meant to bring us closer together, I am sure that each and every one of us, when we return to our homes and begin to look over our business in the past, as well as look to the future, will see that there has been no reason, and there should be no reason, why the manufacturer and retailer should stand in opposite directions when only one step in the right direction for each will bring them together, and that this long drawn out controversy will only tend to enlighten each more to the conditions of the other. When all is said and done, there should be no more trouble over "terms of sale" where both interests are the same and where each has his own side and realizes that one should not be made to bear the burden of the other.

I trust that you will look at this in the same light and that the agitation which we have had in the past will be disposed of and that we will not hear anything further as to "terms of sale," when this can be so easily adjusted by arranging a universal form, which can be varied to suit both buyer and seller.

The Retail Lumber Dealer must be a Salesman

It is a frequently repeated saying that "A thing well bought is half sold." Regardless of their qualifications as buyers, we believe that too many retail lumber dealers are inclined to let their stock do its own selling, says the Mississippi Valley Lumberman. In other words, they do not use ordinary hustling ability to enlarge their business, to say nothing of employing even the commonest business methods to the same end. They are content, rather, to sit idly down and expect business to come to the yard, forgetting all the time that there are agencies constantly at work to take trade away from them. Sometimes, and under some conditions, where it is a case of hustle or get out, they will go after trade with the true fighting spirit, and the results will be the evidence of what others might do even where the incentive is less.

In the retail lumber trade, as in the wholesale end of the business, it is difficult to force sales. Consumers will sometimes be attracted by special offers, just as retailers will be; but it is always difficult to force goods on an unwilling buyer. The point is that proper methods of salesmanship can often make a willing buyer out of an unwilling one. One of the first principles of salesmanship is to command attention. The retailer who keeps his name constantly before his community as a seller of lumber will be first in mind when there is a thought of making use of lumber.

But it is not enough to be known as a lumber dealer. The dealer must be able to interest prospective customers, and this requires something more than merely keeping his name before the public. We know of no better way to get the public interested and hold that attention than liberal patronage of the local papers; not by placing in their columns a standing advertisement, but by saying something new every week or every month. The retail lumberman who does not feel equal to the task of writing attractive advertisements, can, at a very low cost, have the work done for him by experts who make a study of such requirements. Through advertising and personal efforts the retailer can institute the next step, that of creating desire. By making attractive presentations of seasonable material at the proper time of the year, he desire for such material is encouraged.

Having gone that far the retailer, in these latter days, finds another problem to solve. It is competition. Not that he has not always been obliged to meet competition. Few retailers have ever enjoyed freedom from competition for any length of time; but up to recent years it has been the competition of others in the same line of trade and in the same circumstances. Now he is constantly called on to combat outside influences. But he can be just as successful against this new form of competition as he ever was against the old, only he must hustle. Too many retailers expect their associations or the Code of Trade Ethics to do their fighting for them. They will expect their associations to keep their neighboring dealers "off the grass," and they will expect the rules of ethics to keep the wholesaler from attempting to sell goods in their territory. Then they will expect Providence to keep the catalogue house from selling goods to their natural customers. They will be disappointed in each of these expectations unless they do something to assist.

No association will enter into the business of selling his stock for any of its members, and trade ethics will not protect him unless he goes after business for himself. Neither will Providence divert trade away from the catalogue house toward his yard unless he can show customers their advantage in buying from him. It is a whole lot better to forestall a purchase from a catalogue house than to criticize it after it has been made. It is not always possible to do this, but the wide-awake retail dealer will know enough of what is going on in his community to be able to get first chance at most of the bills, and if he is a good salesman, the catalogue house will not get the opportunity to figure, or, if he does, will not be able to get the business. Where the catalogue house does get a chance to figure on a bill, does that end the effort to sell it? By no means. If the prospective customer does not at once accept the figures, the catalogue house sends a follow-up letter. If no reply is received to this another is sent, and often a personal representative visits the customer. The opportunity of the local retailer to follow up business in this manner is much greater, but we venture to say that it is rarely taken advantage of.

In the average country community it ought to be an easy matter for the energetic dealer to keep informed of what is likely to be done in the line of building. Personal trips around town and to the surrounding country and conversations with farmers and town people will bring out such information, and following it up will often land the bill, or give the dealer the opportunity to bid on it. If catalogue house competition is probable the dealer should get all the information possible as to what prices he may be obliged to meet from this source. A lumberman whose experience includes the operation of retail yards within a few miles of catalogue house centres, says that the dealers in this section are very successful in meeting that competition, because they know it is there and must be met if they are to continue in business. This fact sharpens their wits and enlightens their energy. They are constantly alert because they are obliged to be.

Still another point in good salesmanship is to always treat a good customer fairly. Hundreds of retail dealers make a practice of buying their stacks from the same concerns year after year. As a rule the orders are placed with little or no mention of prices. The dealer has confidence, born of experience, that the wholesaler will treat him fairly. If he will, he can gain the confidence of his own trade in the same manner. , After this is said, however, the principal asset necessary to successful business is the ability and disposition to hustle for trade by employing every legitimate method. Some business will come without being sought, but the average retailer of lumber will starve on the profits from that alone.

The "Nose for News" in the Retail Yard

The capable newspaper man has a peculiar and particular qualification that is known among members of the fourth estate as the "nose for news." This faculty is an intangible something which enables the newspaper reporter to detect matters of public interest that would escape the attention of the ordinary citizen. It is the ability to recognize large or small affairs that will make good "copy."

The "nose for news" might not be a bad faculty for the retail lumber dealer to possess. He is not in the newspaper business, but he has lumber to sell. If he knows what is going on in his community —who is going to build, who is thinking of building, and other similar items of information—he is in position to be first on the ground with his figures and to direct the mind of the buyer to his yard before the buyer has had opportunity to commit himself in some other direction. Such a dealer also watches the business and plans of corporations and business houses in his locality and, when they contemplate an addition, if he has a "nose for news," he soon learns of the fact.

After all, the "nose for news" is chiefly a wide acquaintance and the faculty of keeping constantly on the alert for information. A reported hears a remark made on a street car, detects some unusual circumstance which arouses his curiosity, and follows the lead until he has learned the "why" and "wherefore" of the whole matter. Let the retail lumber dealer in a similar way keep his eyes and ears open. When he hears an intimation of prospective building let him find out who is going to build, when he is going to build, and then be the first one to offer his assistance.

The "nose for news" in the retail lumber yard is merely the "nose" for business. The widening of acquaintance means more than simply learning what is about to happen. It is a good thing for the manager to know many people, for many people ultimately become buyers on a larger or smaller scale.

Hardwood Trade Conditions in Michigan.

At the recent quarterly meeting of the Michigan Hardwood Manufacturers' Association held in Detroit, the secretary, Mr. Bruce Odell, read the following report upon market conditions:

A general review of northern hardwoods shows a healthy and, for most items, very satisfactory condition. Stocks generally are comparatively light, especially maple, beech, birch and soft elm.

The urgent demand for the better grades of hard maple continues, with practically no dry stock offered. Beech has recently followed maple in the upward trend, and stocks dry enough for immediate use are exceedingly light. Birch has been in good demand during the last year, and the call for high grade stock seems as insistent as at any time during the year. The last year has been a comparatively good year for soft elm, with higher prices ruling for the better grades. Ash, basswood and rock elm have not occupied as strong a position as might have been desired, owing to the use of competitive woods, but there seems to have been no particular weakening in price or accumulation of stock, unless it be in rock elm, but this is one of the minor woods and, with few exceptions, is of little consequence to the manufacturer of northern hardwoods.

In the opinion of your committee the items calling for the most careful consideration of hardwood manufacturers in Michigan are low grade hardwoods, No. 3 common, maple, beech and birch. The marketing of all low grade hordwood lumber is, of course, of importance, but the three woods named are especially so, for the reason that, under conditions prevailing during the last two years, these items have been marketed at an actual loss of $2 to $4 a thousand. Our effort should be directed toward the handling or regulation of these items, so as to get for them at least the cost to manufacture and market.

No. 3 common, hardwood, maple, beech and birch was thought of enough importance to warrant a special stock report for use at this meeting, and your secretary has gathered and compiled that information. The condition as revealed by that report, while not as favorable as we would like to see it, is not particularly discouraging; in fact, we have some reason for encouragement, as the total stocks shown by mills reporting, both April, 1910, and April, 1911, show a slight decrease in stock, which indicates that we are at least holding our own, and, if we can accomplish this during a period like the last two years, it should not be difficult to so handle our No. 3 common as to obtain a much better price for it in the near future.

Overproduction.

A careful analysis of stock reports and market conditions has shown how small a proportion of over or under production will influence the market so as to make it a profitable or an unprofitable one, and as 5 per cent. one way or the other is sufficient to make this difference, manufacturers should lend their efforts to either producing less No. 3 common or divert enough of it to some other use than that to which it is put at present. Many manufacturers claim they can not produce less of the No. 3 common by leaving it in the woods, as there is done up in the same package with it so much of the better grades that they can not afford to lose, and this, to a certain extent, is true, but every manufacturer brings to his mill a certain amount of logs about which there is some question as to whether it is more profitable to leave them in the woods or saw them into lumber.

We believe it to the best interests of hardwood manufacturers in Michigan to give No. 3 common the benefit of the doubt, by leaving the doubtful logs in the woods. Action of this kind may seem heroic, and will be criticized by those who are working themselves into a frenzy about the so-called wilful waste of our forests, but it will be difficult to convince a lumberman, at least, that it is waste to leave an article that costs $1.50 for every dollar he gets out of it, and this is just the condition that has prevailed with No. 3 common during the last two years.

The other method suggested, of diverting No. 3 common to other uses, should be made the special study, not only of this association, but of each member of it.

Tie Material.

The manufacture of ties from maple, beech and birch is going to help, but not all of our members are so situated as to manufacture ties, for the reasons that it requires logs cut to 16-foot lengths, and so many pieces that will make only one tie leaves considerable waste. It requires some special mill equipment, and many manufacturers are so located, as regards freight rates to the present consuming points, that they are barred from producing ties.

It must be considered also that, unless more railroads adopt the use of treated ties, there would soon be an overproduction with unprofitable prices. It has been demonstrated, however, that a beech, birch or maple tie, properly treated, is much superior to an oak tie, and practically all railroads touching Michigan would consider the use of ties from these woods, if they were assured of an ample and constant supply. So that, if the use of ties from maple, birch and beech is to be greatly increased, it will be necessary for the manufacturers to put in treating plants, and be in position to furnish the railroads with ties ready for use.

Another item of particular importance at this time is the flooring grade of maple, but fortunately this item is well within the control of the manufacturer of maple lumber. It is true that the maple flooring business is in a deplorable condition, but this is the fault of the flooring manufacturer, and it is unnecessary for us to suffer for their faults or mistakes. It was shown in our January report that there was a surplus of 10,000,000 feet of maple flooring against a decrease of 37,000,000 feet of maple lumber of the grades used for flooring. Carefully prepared and reliable statistics show a constant increased use of maple flooring, and there is no indication that this year will be an exception. Many maple flooring manufacturers—even those manufacturing their own lumber—are short of flooring stock to-day, and are using lumber that should have remained on sticks for several months.

Hemlock.

Owing to the increase in the price of yellow pine, hemlock has been moving more freely, and we believe that hemlock lumber now occupies a stronger position than for some time past. Yellow pine manufacturers are optimistic as to values and, if they maintain them, there is evidently a future for hemlock. Conditions certainly have improved materially during the last sixty days.

Statistics gathered by your secretary and others indicate that the 1911 peel of Wisconsin and Michigan will be about the same as for 1910, while tanners are carrying slightly larger stocks than those of a year ago, but there is a condition that may influence this year's peel, a condition that is unusual, and with which none of the manufacturers seem well posted. That is the effect of the forest fires of two years ago.

Foreign Trade in Canadian Lumber

The report of the Department of Trade and Commerce for the month of February, 1911, shows that the exports of forest products from Canada during that month totalled in value $1,312,969, a decrease of about $200,000, as compared with February, 1910, and the smallest total since the year 1905. For the eleven months ending February, 1911, the exports of forest products were valued at $42,919,570, a decrease of $1,500,000, as compared with the eleven months ending February, 1910. The imports of wood and manufactures of wood for the month of February, amounted in value to $1,174,525, as compared with $826,383 during the month of February, 1910. For the eleven months ending February, 1911, the imports of wood and manufactures were valued at $15,382,577, as compared with $10,000,776, during the corresponding period of 1910, and $7,681,365, for the corresponding period of 1909.

Details of the exports of wood and manufactures of wood are included in the report. They show that the exports of logs for the eleven months ending February, 1911, totalled in value $1,032,854, as compared with $880,686, for the eleven months ending February, 1910, and $863,731 for the similar period in 1909. The exports of pine deals for the eleven months totalled in value as follows: 1911, $1,468,801; 1910, $1,632,568; 1909, $1,676,082. Exports of deals, spruce and other timber for the eleven months' period totalled in value as follows: 1911, $6,557,123; 1910, $6,097,159; 1909, $4,920,479.

Exports of planks and boards for the month of February were valued as follows: 1911, $648,717; 1910, $749,636. Of these sums, $430,404 was the value of planks and boards exported to the United States during 1911, and $102,012 to the Argentine Republic. To the United Kingdom the value of planks and boards exported during February, 1911, was $35,851. This was a substantial increase over February, 1910, when exports of planks and boards to the United Kingdom were valued at $8,911. The exports to the United States during February, 1911, showed a decrease of about $116,000, as compared with February, 1910. For the eleven months ending February, 1911, exports of planks and boards were valued at $20,329,480, as compared with $21,674,868 for the eleven months ending February, 1910, and $18,050,307 during the eleven months ending February, 1909. Of these quantities, the exports to the United States were valued at $15,143,289, a decrease of $1,400,000, as compared with the similar period in the previous year, and an increase of $1,130,000, as compared with the eleven months ending February, 1909. The exports of planks and boards to the Argentine Republic during the eleven months were as follows: 1911, $2,153,594; 1910, $2,244,550; 1909, $1,360,554. To Great Britain the exports of planks and boards were valued as follows: 1911, $1,538,779; 1910, $1,357,221; 1909, $1,408,294.

Exports of shingles to the United States during the eleven months were valued as follows: 1911, $1,544,105; 1910, $2,152,878; 1909, $2,328,820. Exports of pulpwood during the eleven months were valued as follows: 1911, $5,693,058; 1910, $5,635,879; 1909, $3,930,930. The total exports of wood and manufactures of wood were valued as follows: February, 1911, $1,758,403; February, 1910, $1,977,998; eleven months ending February, 1911, $48,981,431; 1910, $49,844,321; 1909, $41,639,491.

CAMP DEPARTMENT

Skidding

The term skidding as a logging operation is generally and in all sections applied to the short haul of the log from the stump over an improvised route of varying crudity to a point reached by a means of transportation more permanent in character and generally constituting the main artery of the logging system of which numerous skidding operations are branches.

If one were to liken a logging crew to an army, the woods foreman is the general, the fallers, sawyers or choppers are the pickets, the road gang and the sappers and the skidding crews are the skirmich lines—the outposts.

As a factor in the cost of lumbering operations logging is of extreme importance and as an element in logging cost skidding is a heavy item. The preliminary work of clearing and building skidding roads is in some localities expensive in the extreme. In fact, the cost of logging much of the timber now being utilized was in an early day considered prohibitive and to the farsighted investor afforded an opportunity that was wholly neglected by those who did not foresee the tremendous development of facilities and machinery for removing timber that at one time was not available because of their lack.

The variety of skidding devices and methods is almost endless, and it ranges all the way from the crudest method, which is the only practicable one in some localities, to the most highly developed modern mechanism utilized where it is the most practicable and profitable method.

Local conditions absolutely determine skidding methods and machinery, and as conditions vary widely, in even a single section of a given operation, different machinery and methods may be absolutely demanded in localities within hailing distance. While this is true, it is a fact also that the timber growth and other conditions peculiar to a large region determine and control the development of methods that may be said to characterize that region. That is to say, in general, Pacific coast methods differ somewhat from those of the hardwood, hemlock and spruce sections of the Appalachians; cypress operators have methods peculiarly adapted to conditions that prevail in the cypress swamps; northern pine, hemlock and hardwood operators have developed methods that suit conditions under which they labor; southern pine manufacturers also pursue methods of their own. However, it is well within the truth to say that in all these sections, to some extent at least, conditions are similar and the same methods are in practice or might profitably be put into practice.

Origin of Skidding

Lumbering on a large scale in the interior in which skidding is an important operation was earliest developed in the north, where the ground was covered with snow a considerable part of the year. Consequently, skidding was carried on extensively, almost exclusively for a great many years, in the winter season on the snow, and the design of skidding devices was determined by that practice. However, as the lumber industry has developed in the warmer parts of the country woods work has been carried on at all times of the year and skidding devices have been devised that are suited to the hauling of logs over bare ground.

Naturally, to the pioneers in the lumber industry fell the work of devising methods and machinery of which the more recently developed sections have been able to take advantage. Consequently, in some of the sections of this country just being opened up the latest skidding machinery is in use and really exhibits skidding logging methods in their most highly developed and improved state.

Roughly speaking, logging operations are carried on in forests growing upon three classes of land—swamp, inland and mountain. And inasmuch as methods in use are determined by the class of land or the section in which they are applied, any discussion of logging methods will be most satisfactory when pursued with reference to that classification of forest lands.

The class of timber has a direct and very material bearing upon the class of machinery used; and the class of trade to which a given operator caters is a factor as related to the length and size of logs handled. While a snake team will haul a 20-log string of small spruce logs, a donkey engine is required to handle the heavy fir logs of the northwest and the yellow pine of the southwest.

The price and supply of labor, the cost of horses and the grain for them and the cost and availability of fuel are determining factors.

The skill, ingenuity, resourcefulness and the information possessed by the logging superintendent are extremely important factors in logging, and the seemingly impossible operations performed by the adaptation of insufficient facilities to the necessities of the occasion often bear eloquent testimony to the possession of these qualities developed to the highest degree. This fact doubtless will be disclosed as discussions in this column progress. But it may not be amiss to say that the development of the science of logging to its present high position is due very largely to the initiative and the suggestions of practical loggers. If logging may be referred to as a science, the use of the highly perfected logging machinery of the present to perform work not contemplated by its designers is an art of which many logging superintendents are masters and fully entitled by their course and accomplishments to the title M.A.

The relation between the value of forest products and the cost of handling them can not be lost sight of for an instant. The fact that while the tree standing in a region remote from market is practically valueless, the application of expensive labor to transport it to a consumer transforms it into a highly valuable product, illustrates the part that labor bears to lumber cost.

Labor cost as a large element begins with skidding, and with it the important question of economy of operation first arises. How to do the work in the most economical way is the question uppermost in the minds of general manager, the woods superintendent and the skidding foreman.—American Lumberman.

Light Burning

The question of whether it is wise to burn over the woods lightly at stated intervals has recently caused much discussion. This theory of protection against fire is called "light burning." The idea is that if the litter on the forest floor is burned over every three or four years there will be much less danger from possible big and destructive fires which might come along later on, says F. E. Olmstead in the Pioneer Western Lumberman.

Many people believe that if the litter of the forest is allowed to accumulate without being disposed of in some way it will be impossible to control the fire situation and the timber will be completely destroyed in the near future. Forest fires set out by the Indians in days gone by are pointed to as good examples of the fact that the forests of California have flourished in spite of the burnings made by Indians.

The fires set out by the red man were intended to help him in his hunting and the question of forest protection probably never entered his head. These fires were anything but "light burnings." Most of them were terrific conflagrations, destroying most of the young growth of timber up to 30 or 40 years of age, killing and injuring the mature timber so that the present stand is less than two-thirds of its original volume, and changing vast tracts of land which once supported fine merchantable timber into useless wastes of brush and chaparral. Many other counties offer melancholy examples of the results of these old Indian fires. They were highly destructive, not beneficial.

One method of "light burning" is to prepare the ground somewhat before the fire is set out. This preparation usually consists in raking the litter and other refuse away from the trunks of the older merchantable trees so that when fire runs over the ground they will not be injured. No attention is paid to the protection of young timber. In fact, thicket growth of pine and fir is looked upon as dangerous brush, which should be gotten out of the way, and, for this reason, it is often cut down where fire is likely to spread from it to the older trees. It is expected to burn up when the fire comes along and its destruction is a part of the general plan for getting "brush" out of the way. This method of "light burning" protects the old timber fairly well for three or four years. It must then be repeated in order to keep the ground clean. It results, however, in about the same serious destruction of young growth as "light burning" without any preparation of the ground, for the preparation is intended to safeguard the big trees only.

Another system of "light burning" is that practiced by the Forest Service on lands which have been logged off on timber sale areas. This calls for a very thorough preparation of the ground before the burning takes place. The tops of the felled trees are lopped and piled together and the piles are so built and placed that they can be burned without injuring any young timber whatever. At the proper season the piles are burned. Fire is not allowed to run over the ground between the piles and is controlled absolutely. This is "light burning" which both cleans up the ground most effectively and provides absolutely against any injury to the valuable young growth of trees.

Lumber slashings are the most dangerous fire traps of the forests. The tops and refuse are left upon the ground and form a most serious menace to adjoining lands, both private and public. The Forest Service has used fire in this way for over ten years and is the only owner of pine timber lands in California which has used the "light burning" method successfully in such a way as to clean the ground without killing off the young timber.

The U.S. Senate and Reciprocity

Views and Evidence of the Lumber Interests as Submitted to the Finance Committee—The Conservation Movement

Washington, May 25.—The hearings of the Senate Finance Committee on the Canadian reciprocity bill have been interspersed with evidence from the lumber interests of the country during the past two weeks. Unlike the hearings of the last session, this time there were representations both for and against the bill, a fact which lent more interest to the event. Another fact that lent spice to the occasion was the prosecution launched on Friday by Attorney-General Wickersham for the United States government against the so-called lumber trust. This was based on the decision in the Standard Oil case, the judgment in which the Supreme Court of the United States earlier in the week had been that the great oil monopoly should be dissolved for violation of the Sherman anti-trust act, as a corporation in restraint of trade. There have, of course, been many mutterings against the lumber men of the country, and the fact that the prosecution has been launched at this time may have significance and be a measure—not without chances of effect too—to stimulate opinion in the Senate in favor of the reciprocity bill. Certainly, the country has entered upon a period of trust hunting, and public opinion is not in favor of extending any favor to large interests that are accused of holding up the prices on such a staple commodity as lumber.

The evidence on lumber that was heard by the Finance Committee came first from the lumber interests of North Tonawanda, and formed part of representations by the Board of Trade of that city generally in favor of the bill. Following them came Mr. Leonard Bronson, of Chicago, manager of the National Lumber Manufacturers' Association of the United States. Last session the witness from Chicago was Edward Hines, who has since attained national prominence—or notoriety—for his alleged connection with the election to the United States Senate of William Lorimer by the Illinois legislature. It was he who it was said had asked for contributions to raise the $100,000 which it had cost to "put Lorimer over." The Lorimer case is engaging the attention of the Senate here, anad further light on the lumbermen's interest in his election may be disclosed shortly, as the Senate is almost certain to make another investigation.

Mr. Bronson was very diffuse in his testimony and on the witness stand on several different days. He came loaded down with material that he thought would interest the Senators. He was badgered a good deal on the point of there being agreements to keep up prices, but for the most part his memory failed him when it came to a critical point in the discussions. Just here it may be said that the hearings have been to some extent farcial in any case, for the witnesses were not sworn; they came and told whatever sort of story they cared to, and scarcely a Senator had the interest to indulge in any sharp or close questioning. The fact is, the Senators' minds were made up on most points affecting the bill before the hearings started, and their point of view did not change. The evidence given, therefore, rests in the record for future reference, and for the use of Senators in the subsequent debate in the Senate.

Mr. Bronson admitted under questioning that he had heard of agreements by lumbermens' associations to keep up prices, but, he said, "I never knew any of them to be effective. I have been connected with the lumber business rather intimately for twenty-five years, before the time of the Sherman anti-trust act, and I have seen—I have been in meetings time and again where, in those days under very serious conditions, bad conditions, they would make an agreement, perhaps on a rising vote, to make such a price, beginning to-morrow morning, for perhaps a definite period, or as long as they could. Some people, however, thought before the day was over to tell their agents to sell "all you can at the old price." I never knew anything of that sort to amount to anything in the long run or in any large way."

Further questions, however, disclosed a glimmer of recollection in Mr. Bronson's mind of cases of a territory being apportioned and a price maintained, and of penalties being enforced for cutting prices. Details of this he could not remember, however.

Mr. Bronson's specific objections to the reciprocity bill found expression once in a while between questions. He recalled President Taft's words: "By giving our people access to the Canadian forests we shall reduce the consumption of our own, which in the hands of comparatively few owners, have a value that requires the enlargement of our available timbers."

"That expression," said Mr. Bronson, "is what I particularly wanted to mention. This reciprocity bill does not give out people access to the Canadian forests, nor to Canadian logs, which are produced at a cost exceeding the value of the standing timber; that is, the log is worth more than double the value of the standing timber; of the ordinary lumber, and white pine. Neither does it give access to the logs, but only to the product of the saw mill itself—that it, to a commodity two stages removed from the raw material." Mr. Bronson went on to complain that the treaty was carelessly framed, for it made no provision for the removal of the restrictions on the export of logs from Canada, as was done in the case of pulpwood.

Mr. Bronson's references to the conservation movement were one of the most interesting parts of his statement. He said it was useless to think of encouraging conservation of timber unless the home market was protected. He warned the American people, that while in sympathy with conservation, it could only be realized under higher priced lumber. If the lumber duty were removed the price of low grade lumber would be reduced, and that would make it impracticable or unprofitable to put a lot of it through the mill. It would, therefore, be left in the woods. Mr. Bronson said the annual cut in the United States was forty-five billion feet, and under free lumber and neglect of the cheaper grades, a larger acreage would have to be cut over to get the necessary output. "If we got the total product from Canada," he said, "it would be only about five billion feet a year. We could wipe out the whole timber resources of Canada in eight or ten years."

One of the sittings of the committee was given over to delegates from the North Carolina Pine Association, headed by W. B. Roper, the secretary. These men made a strong protest against free rough lumber from Canada, and made special point of the restrictions on the export of logs from Canada. They quoted a resolution passed by their association declaring the reciprocity pact to be "both inequitable and unjust, and discriminates against the lumber industry, being barred of reciprocal features so far as this industry is concerned." A. R. Turnbull, of the Rowland Lumber Company, complained of the disadvantage of the southern lumbermen in the poor labor with which they have to be content. There is plenty of colored labor, he said, but it is unreliable and inefficient, compared with the white men employed by the Canadian lumbermen. For this reason, and others, they desired that the tariff should be maintained. He said they could get along as they are.

The views of the North Tonawanda men were presented by Mr. H. W. Brush and Mr. Preisch. Mr. Brush submitted a memorial from the Board of Trade endorsing reciprocity, and stating that hitherto they had always asked for the highest protection, so that their attitude this time was radical and unprecedented. They wanted to enlarge their sources of supply for rough lumber, and regarded free rough lumber from Canada as of great importance. Forty per cent. of the lumber coming into Tonawanda came from Canada.

Market Correspondence

A Better Understanding at Montreal

Montreal, May 25.—Good progress is reported in connection with the efforts being made to bring about a better understanding between the manufacturers, wholesalers and retailers of lumber in the Province of Quebec and Eastern Ontario, with regard to the limitations which should govern the operations of the different departments of the trade. For a long time the relations between these departments have been somewhat strained, the retailer claiming that wholesalers were dealing direct with contractors and the wholesalers complaining that they were not being dealt fairly with by certain manufacturers. As a result of these conditions a movement has been on foot for some months past to have these matters regulated and each department placed on a well defined basis that would prevent conflict between the various interests.

At a meeting of the Montreal Lumber Association held in the Board of Trade a few days ago, very satisfactory reports were presented regarding the negotiations being carried on in this regard. It was stated that of fifty manufacturers who had been written on the subject, thirty-five had replied to the effect that they cordially approved of the proposals recommended and promised their wholehearted support to the movement. These included all the large operators and most of the small ones. Furthermore, it was declared that the wholesalers were more than willing to treat fairly with the retail trade.

Having thus reached an understanding with the majority of the manufacturers, the other departments of the trade feel confident that one of their most serious troubles will be immediately removed. Great improvement is expected, to the benefit, it is believed, of all concerned, and to the detriment of none. Wholesalers have been informed as to who among the manufacturers are prepared to cooperate with them and hereafter, they will report all cases which come to ther notice of manufacturers who sell to their customers direct.

Dry Weather and Fires in Quebec

There has been very little rain in the province of Quebec since the snow melted. In fact the snow has not all melted yet, it being reported from the Gaspe Peninsula that they still have sleighing there, but the seriousness of the situation is seen in the fact that the river drives have not yet all reached their destination and the result of the drought is that many companies are experiencing great difficulty in getting their rafts through and there is a possibility that unless rain comes within a few days thousands of logs will be practically stranded and at least delayed until next season. In some quarters it is feared that this may affect the prices of lumber considerably. It is expected that spruce, pine, hemlock, and cedar will be the most seriously affected, and these in the order named. One dealer said that prices might be increased to the extent of 50 cents or a dollar a thousand if a real scarcity resulted from the existing conditions.

But a still more serious situation is developing through the prevalence of bush fires which are spreading over very considerable areas. Serious fires have broken out on the Maurice river in the vicinity of Shawinigan Falls and at many other points in the northern sections of the province. In some cases limit owners have had to take their men off the drives to fight the fires. Not the least disturbing feature of this situation is the fact generally admitted that these fires are caused by settlers burning off underbrush and clearings utterly regardless of the regulations plainly laid down by the government for the very purpose of preventing forest fires. In some instances it is hard to account for these fires on the score of mere negligence of ordinary precautions or even the recklessness of the pioneer settler. It would almost seem as if some of the devastation was brought about through revenge.

Here arises a new and exasperating situation that is admittedly very hard to deal with. The question of the prosecution of persons suspected, or even known to be guilty, of forest incendiary is a very vexed one. It is well known that persons arrested for starting forest fires, whether accidentally or otherwise, or who have been warned that they would be prosecuted if they continued to ignore the regulations laid down for forest preservation have threatened that if they were prosecuted, they or their friends would do worse and would lay waste whole areas of timber limits as a means of venting their spite upon the prosecutors. The burden of responsibility for such prosecutions now rests upon the limit owners. Forest rangers are appointed by, or on the recommendation of the limit owners, while the government pays half of the expense, but it is well known that if proceedings are taken against anyone for such an offence they have been initiated or instigated by the proprietor of the timber lands, and it is upon such proprietors that these backwoods men would wreak the vengeance. It has been proposed that the matter of prosecution should be taken in hand by the government as this would probably relieve the limit owner of the onus attached to such prosecution, and consequently there would not be the same incentive in the offender to cause loss and inconvenience or other harm to the proprietor. This responsibility the government has so far hesitated to assume.

Trade Conditions in Nova Scotia

Halifax, N.S., May 23.—Not for a number of years has the shipping season opened with such poor prospects as exist at present, particularly on the American market. Last spring, sales of hemlock, which constitute the bulk of Nova Scotia exports to American points, were readily made at $21. This year a similar specification would hardly bring over $19, and poorer specifications of 2 x 4 hemlock which brought from $18 to $19 last spring, have sold as low as $16.50 this season. In face of such poor prices and large stocks, the outlook, so far as the United States market goes, is very poor. The stock of hemlock in the provinces is very large, probably the largest on record, and as there is practically no other market than the United States for hemlock, this stock must naturally go that way.

Hemlock boards are selling very well in Boston and along the Sound, but it only remains for some of the surplus hemlock to find its way in that direction to greatly lower values at these points. Long random spruce has been doing somewhat better than last fall, prices ranging from $19.50 to $21.50, according to specification. Laths are considerably higher than last fall's prices, bringing $3.75 in New York for good double butted spruce slab. Hemlock laths are in corresponding demand at about 50 cents per thousand less. This price is likely to continue for some little time until the larger mills begin to ship their cut; prices then will in all probability go to last summer's level and below it.

Freights from Nova Scotia parts to United States are slightly lower than last year. As high as $4 has been paid to New York from Bay of Fundy ports on hemlock, but $3.75 is about the current rate from Nova Scotia ports on the Bay of Fundy. A charter of $3, Bridgewater to New York, is reported, but eastern and south shore rates range around $3.25 to $3.50, with proportionate rates to Boston and Sound ports.

The English market is reported somewhat weaker than during the winter, and this, with the recent rise in freights, has caused a decline in f.o.b. prices. Dealers are still quoting prices about the same as last summer's prices.

A number of charters for South American ports are reported. Some dealers report this market weaker, while others say that it is as good as it was two months ago. Prices f.o.b. range from $16.50 to $18.50, depending on whether 12-in. stock is included, and if so, what percentage.

A number of Cuban sales are reported at prices ranging from $15.50 to $16.50.

The local market is fairly active, and taking up about all the local cut of pine, with the exception of several West India cargoes.

Spruce cargoes are also in good demand, and are taken up about as fast as manufactured.

Hemlock boards for the local building trade were very scarce through the winter, but are more plentiful now.

News of the Trade

James Dempster, Limited, of Halifax, which has recently been re-organized, reports business good, and good prospects for the season.

J. Newton Pugsley has just completed loading the schooner "Inca" at West Bay with a cargo of over three million feet of spruce deals, this being the first cargo out of West Bay this year.

Shipments from Halifax are falling off considerably, though a large amount of stock is still going forward. The months of March and April were very busy, being probably record months for the shipment of deals from this port.

The custom of the port at Windsor, which has always been 30 M. a day for all schooners, has recently been changed to 20 M. a day for vessels up to 150 tons, 25 M. a day for vessels 150-200 tons, all vessels over 250 tons, 30 M. per day.

Rhodes, Curry Company's mills at Little Forks, Cumberland County, were destroyed May 16th by fire. This firm have been cutting from two to three million in this mill for a number of years, and had a well equipped mill. Their loss will be $25,000.

The Davison Lumber Company report about their usual cut for this season. Their Bridgewater mills have just started operations, as has also their Springfield mill, which has been closed for some little time for repairs. This firm are at present shipping considerable stock, besides loading for Boston, New York and River Plate.

Messrs. J. W. Lowe & Son, Brooklyn, Queens County, are building a new mill on the property recently acquired from George S. McClearn. This mill is up-to-date in every respect, having steam feed rotary, and stock gang equipment. This firm have about completed stream driving, and have about two and one-half millions of logs in their mill pond. Their mill is well situated for shipping, and should enable them to turn out first-class stock.

Mulhall-Mack-McClearn, Limited, are sawing at South Brookfield their winter cut of spruce, hemlock and pine. They are also bringing considerable stock down their sluice from their present river mill. This sluice was completed last fall, and is driving very satisfactorily.

Messrs. Lewis Miller & Sons report a large cut, which should keep their mill busy all through the season.

The Sable River Lumber Company are shipping a large quantity of live sawn box boards from their stock at Wilkins' siding. This lumber comes to Liverpool by rail, where it is loaded on schooners for Boston.

Edward Zwicker & Sons, New Germany, expect busy summer. Most of their stock will be going to South America. They are at present loading cargo at Bridgewater for River Plate.

Manufacturers along the Eastern Shoe are busily engaged in bringing down their drives. A shortage of water is reported on nearly all drives that had to come any distance.

The S. E. Dunn Lumber Company are beginning operations at Doddridge. They are loading a barque at present at Halifax for River Plate from last year's stock. The vessel chartered for the same last year was wrecked while on passage to Halifax.

Crowe Lumber Company, Brooklyn, are bringing down large drives. They expect to start their mill soon, and have been shipping extensively this spring from last year's cut.

F. J. Logan, of Logan & Sutherland, Musquodoboit Harbor; Mr. Kempton, of Harlow & Kempton, Milton; R. Erwin, Shelburne; H. H. Marshall, Digby; Davison Hill, of C. & H. Hill, Truro, and G. T. McNutt, of Mulgrave, all well known lumbermen, are candidates from the respective counties in the provincial elections scheduled for June 14th. It is reported that G. T. McNutt and parties associated with him are to build a woodworking plant at Mulgrave, N.S., to turn out stock that is now largely imported into the provinces.

The Nova Scotia Car Company, of Halifax, have recently increased its output from four to five cars per day. They are using a large quantity of provincial lumber and are importing considerable southern stock.

Trade in the United Kingdom

Liverpool, May 20.—At London, the demand for softwoods has improved since the beginning of May. A slight improvement in the general consumptive demand in the metropolitan area has been noticeable, joiners, furniture makers and case makers appearing to be busier, while the special demand on coronation stand and barrier account has become more active. It is assumed that the slight improvement in the general consumption of softwoods is due mainly to preparations for the coronation. New furniture is being bought; alterations of shop-fronts and buildings are being made, and more goods are being moved between London and the provinces and from town to town, which are requiring more packing cases. Then, there has been an increase in the activity of the building trade in the London area. These things, together, have caused a larger demand for boards; yellow pine of first and second quality, of 1 inch, nominal thickness, and of 11 inches and upwards in width, being taken; and spruce, planed and square edged, or tongued and grooved, of ordinary widths. Spruce deals have been in good demand and liner lots have been inquired for and taken, "to arrive" or on coming to hand. For case making ¾ in. spruce is most wanted, but 1 in. spruce plays a good second to the thinner wood as regards quantity. Case-makers will be kept busy for the next five weeks, whatever they may be thereafter. At London, and in most of the larger cities, a demand has sprung up for round poles and spars, suitable for carrying the lighter decorations which will be used so freely for the coronation festivities. Everything of the kind available will be called for by the time at which the festivities begin, for every town will want to make a show of bunting and streamers.

The stocks of timber at the London docks continues to be of moderate compass. A return of deals just made shows that there are about 681,000 pieces in hand, as compared with about 927,000 at the end of April, 1910. Prices, accordingly, continue very firm. The tendency is to advance, but at the time of writing prices may be spoken of as practically without change.

At Liverpool the demand for yellow pine and spruce has improved, and a better feeling prevails in the market. Stocks of pine and spruce are much reduced, the stocks of New Brunswick and Nova Scotia spruce deals being less than for many years, and fully one-third less than they were at the corresponding time of last year. Prices remain firm, but without quotable change. Scantling has been in more demand and arrival quantities have been easily disposed of as they have come to hand. In pitch pine hewn and sawn have sold steadily and on a fair scale. Stocks, though less than they were, are still ample for the present demand. Birch continues in good and steady inquiry at 1s. 6d. to 2s. 4d. per cubic foot. The stock of logs represents barely a month's supply, and the stock of planks, not more than half a month's supply.

Oak wagon wood has been in active demand, Quebec first quality bringing from 2s. 10d. to 4s. per cubic foot, and second quality from 1s. 9d. to 2s. 10d. The demand for planks is most active but stocks are still of fairly large compass.

At Manchester business has been quieter. Pine deals have been one of the best selling lines, a very fair demand being experienced for these goods. Birch planks are now in small supply but the demand for these is not active at the time of writing.

At the Tyne ports some improvement in business has been experienced. The joining trade is more active, and boards, planks and battens have been more inquired for.

At Glasgow pine and spruce boards and deals have sold steadily and in fair quantities. Oak for wagon work continues in good demand, builders having large orders for wagons now in hand.

The Coming of Ply-Wood

To an extent, ply-wood has been on the English market for years. It has been used for chair and stool seats, and, practically, for this alone. As used for chair seats plywood has had perhaps as large an amount of success as could have been looked for, seeing that it had to compete with so old an institution in the United Kingdom, as the ash seat of the homely Windsor chair. It has competed with other chair bottoms and with the older types of wood "forms" which have been used for meeting rooms and school rooms. The plywood used for chair seats has been used almost entirely for bentwood chairs, a class of chairs which have come into large use within the last five years.

Of late there has been a visible broadening out of the trade in plywood, and it has become quite clear that the trade has within it possibilities of large interest and of much importance to dealers in furniture woods. A new industry, the making of plywood, has come into existence in London, and a production of plywood on a large scale is now possible. The productive capacity of one company (The Veneered Plywood Panel Manufacturing Company) is stated to be 25,000 superficial feet per week. It does not follow that production will go on at this stated rate, but it is certain that production is going on at a rate which proves that the new wood, like the earlier chair seating, has made a market for itself, and it is pretty certain that the demand for the wood will increase, as the new forms in which the wood is being produced make it suitable for a large number of purposes. The writer inspected some "squares"—one could hardly call them panels—of this wood, at one furniture wood depot, which must have been about 40 inches by 36 inches. The wood, while being only about 3-16 inch. in thickness, seemed as strong, for practical uses, as 1 inch board, and, it was said, would not buckle owing to the crossing of the veneer from which the squares were built up, and the system of compression used in the process. The surface would also, it was stated, polish up as highly as solid wood or veneer. One could not view this strong and light, wide-breadth plywood, without being impressed by the extensive field of use which was open to it. For railway coach, ship saloon and stateroom, and for dado, corridor and entrance hall work, it seemed to be the very thing. The writer a few days ago inspected a large and lofty apartment in an old English hall which is being preserved as affording a fine example of English "wainscotting." The walls were completely covered with solid oak, framed and paneled. At the bottom was a deep framed dado; at the top, a deep and very massive "built-up" cornice. One could not help being struck by the vast quantity of oak, relatively, which had been used in wainscotting the walls of that large apartment, and in building the dado and the cornice. The practice of wainscotting walls with oak is an old English style, and at one time was very common. One finds modifications of the practice in many of the newer "picture" houses of the "cottage," "bungalow" and "chalet" types, which are now being built largely in the United Kingdom. In these houses, entrance halls, staircases, dining rooms, window seats, inglenooks, and other parts, are being, in many cases, wainscotted with oak. The discontinuance of the old plan of free wainscotting was due to the cost of the wood, and of the work of framing and fixing. The new plywood squares and panels, open up a prospect of a revival of the old plan of wainscotting entrance halls, corridors, dining rooms billiard rooms, smoke rooms and other apartments. Should this practice be revived this use of plywood will be an entirely new one. If used for wainscotting no other timber would be displaced or suspended, except on board passenger liners, and on these the tendency has lately been to use the newer decorative wall materials instead of wood, so that the use of plywood for saloon and stateroom walls would cause but little displacement of wood. In the case of the new "picture" houses, the return to wainscotting has, so far, been so limited in extent, and the treatment is, as yet, in so uncertain a position, that one could hardly regard a general use of plywood for wainscotting in this case as being a supercession of oak. With regard to the use of plywood for door-panels here, it is to be feared there will be a supercession, the new, light but tough wood taking the place of the usual panels. Yet here again, timber can hardly suffer by the substitution of plywood panels for ordinary panels, whether solid or veneered. The plywood is wood, not composition, like the imitation veneer which is now on the market. It is formed of thin sheets of veneer-like wood, and though having a core of an inexpensive wood, and only one face of figured, ornamental wood, the whole is of wood, none the less. On the other hand, the new plywood industry is making a demand for broad-width figured veneer, for the surface of the plywood to be polished. The new wood is promising to make its way into large use, and into some fields of use in which wood has not been used. It looks, therefore, as if in the United Kingdom the coming in of the newer plywood were going to be of advantage to the timber trade; while, perhaps, causing some substitution of one wood for another for a time.

New Branch of Joinery

The coronation has given us a new branch of constructional joinery in the United Kingdom. The development of the "stand" erection has been carried to such an extent that journals devoted to the building industry have given special attention to the principles of public stand construction and in one case the full construc-

WANTED & FOR SALE DEPARTMENT

PUBLISHERS' NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line ($2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

Wanted to Buy—Ash, Elm, Birch and Basswood, either Log Run or on grades, Fred. T. Smith, 310 Board of Trade Bldg., Montreal. 11-tf.

WANTED—One car 4 x 4 Sound Wormy Plain Red and White Oak. One car each 4 x 4 and 5 x 4 No. 2 Common Plain Red and White Oak. One car 4 x 4 No. 1 Common Plain White Oak, 10 ft. and 12 ft., mostly 12 ft. All kiln dried f.o.b. New York Lighterage limits. George J. Kennedy, 1 Madison Avenue, New York City. 11-11

Lumber Wanted

Have you any stock which you wish to sell? If so, make the fact known to probable buyers by placing an advertisement in the Wanted and For Sale Department. Address Canada Lumberman, Toronto.

Tank Lumber Wanted

We require 2-in. and 3-in. Tank White Pine, 6-in., 7-in., 8-in. and 10-in.; 10 ft. to 24 ft. Also red pine. Highest prices for Pump Squares. Ontario Wind Engine & Pump Co., Ltd., Toronto, Ont. 7-tf.

Spruce Limits Wanted

Wanted to buy Spruce and Pine limits in Eastern Canada, 100 to 250,000 acres. Option must be granted. Principals only, no agents. Apply Sieveking, Podmore & Wright, 57 Grace street, London, England. 8-11

Wanted—Ash, Elm and Oak

Wanted to purchase, for export shipment, Ash, Elm and Oak. Kindly state price and point of shipment. Address, with full particulars, Robert Cox & Company, Hope Building Ottawa, Ont. 9-12

FOR SALE—LUMBER, ETC.

For Sale

Product of two million feet of good white pine logs, rail or water shipment from Bruce Mines. Apply Bruce Mines Saw Mill Company, Limited, Bruce Mines, Ont. 11-14

Shingles for Sale

For Sale—Three cars XX, 16-inch sound butt cedar shingles. Prompt shipment. Write Gull River Lumber Company, Limited, Lindsay, Ont. 11-12

For Sale

One car 4 x 4 C. & B. Black Ash.
One car 8 x 4 C. & B. Basswood.
One car 8 x 4 1 and 2 Basswood.
One car 8 x 4 1 and 2 pl. R. Oak.
One car 6 x 4 1 and 2 10 and up wide.
One car 4 x 4 ¼ W. Oak strips.
This stock is 18 months on stock.
25 M. ft. 4 x 4 to 8 x 4 African and Tabasco Mahogany very wide and this year on stock, phone or write for prices.

THE JOHNSTON LUMBER CO.,
11-12 Toronto, Ont.

For Sale
Hardwood and Hemlock

If you want to buy Hardwood or Hemlock or Ties, Posts and Shingles, visit limits and make an early contract. Pay as work progresses. Can get you 5 or 10 million feet of each on Georgian Bay. Box 266, Canada Lumberman. 9-16

For Sale

4 cars 1-in. Ash, No. 1 C. and B.
2 cars 1¼-in. Ash, No. 1. C. and B.
6 cars 1½-in. Ash, No. 1. C. and B.
4 cars 2-in. Ash, No. 1. C. and B.
6,000 Cedar Telegraph Poles, 30 to 50 ft.

GEO. C. GOODFELLOW, Montreal.

FOR SALE
For Immediate Shipment

2 cars extra choice 6-4 Highland Soft Elm.
3 cars 4-4 White Basswood.
1 car 3-in. Hard Maple.
1 car 4-in. Hard Maple.
1 car 5-4 Soft Maple, extra wide.
1 car Cedar posts, 5-in. top and up.
4 cars Cedar posts, 4½-in. top and up.
200,000 ft. 2-in. Hemlock, Dry.

FOR SALE—MACHINERY, ETC.

FOR SALE

Small Band Sawmill, Waterous make, complete with filing room tools, and Gang Edger, Live Rolls, Slab Slasher, Shingle Machinery, Shafting Gearing, Etc., also, Dynamo and Motor. Also a large number of factory Machines, comprising Matchers, Moulder, Band Rip Saw, Variety Saw, End Matcher, Shafting, Belting, Shaving Exhauster and Pipes, Dry Kiln with Steel Cars, Engine and Boiler, Etc.
2-tf. JOHN FINDLAY, Owen Sound.

New and Second Hand Machinery For Sale

AT HUNTSVILLE

One Northy (secondhand) "Duplex" Steam Pump, 3½ x 2½ x 4.

One secondhand Circular Saw Grinder "Colville Patent," good as new, built by The Wm. Hamilton Company, Peterboro.

One secondhand Upright Boiler, engine attached, 20 h.p. Boiler tested to 160 lbs. C. W. pressure.

One Steam Oil Separator, 8-in. pipe. McEachren make.

One Iron Saw Frame and Mandrel complete with pulleys and third bearing. Steel Mandrel, 3 7-16 diam. Watrous make.

One Dry Kiln in four bands of pipe. Steel jacketed with 5 ft. Fan Shaft. Bearings and Pulley. Back pressure valve and steam trap. Over 4,500 ft. lin. piping in the four banks in addition to bases.

One new three saw Edger. Steel Mandrel 2 7-16, with three bearings open end, for 16-in. saws, including Table Rollers and Shifter Irons.

THE HUNTSVILLE SYNDICATE,
11-14 Huntsville, Ont.

WANTED—EMPLOYEES

Advertisements under this Heading two cents a word per insertion. Minimum charge 50 cents

WANTED—Good man with Portable Saw Mill to cut out one million feet. Commence September 1st. Can give several years contract. Money advanced as work progresses. Apply Box 275, Canada Lumberman, Toronto, Ont. 11-14

WANTED—Manager Lumbering Company, located Bahama Islands. Must be active, experienced, capable of installing plant, constructing railroad, organizing help (all negroes) general all round man. State salary and experience. Box 276, Canada Lumberman, Toronto, Ont. 11-11

WANTED—EMPLOYMENT

Advertisements under this heading one cent a word per insertion. Box No. ten cents extra. Minimum charge 25 cen's

WANTED—Situation as Mill Foreman. Gauge or Circular Saw Filer. Good Millwright. Thoroughly understands the lumber business. Box 268 Canada Lumberman, Toronto, Ont. 10-t.f.

If you want an employee for any branch of the lumber or woodworking trade the best, quickest and cheapest way to get him is by placing an advertisement on this page. Canada Lumberman and Woodworker, Toronto, Ont.

Reliable man with experience in hardwood lumber desires position as travelling salesman to represent an American firm in Western Ontario to solicit orders from manufacturers for all kinds of American hardwoods. Can furnish A1 reference. Address, Box 278, Canada Lumberman, Toronto, Ont. 11-11

BUSINESS OPPORTUNITIES

For Sale

Saw Mill of 30 to 35 M. feet daily capacity, complete with engine, two boilers and lath machinery. For particulars write to E. D. Croden, Box 596, North Bay, Ont. 3-tf.

Sash and Door Factory

Partner wanted with $5,000 to $10,000. Practical man to take full charge or will sell on easy terms. Apply Box 259, Canada Lumberman, Toronto, Ont. 7-12

Timber Limits For Sale

Can be quickly and profitably disposed of by advertising them on this page. This is where buyers of timber property look for opportunities to invest, if your "ad" is here the investor will see it. Canada Lumberman, Toronto, Ont. tf.

Timber and Land Investment

Farm of three hundred acres within 35 miles of Toronto—one hundred acres of which is timber land—Pine, red and white Oak, Maple, Beech, Basswood, etc. Balance of farm is under cultivation, thirteen acres bearing apple orchard. Buildings cost over five thousand. Price, $29,000. Box 160, Canada Lumberman, Toronto, Ont. t.f.

Steam Saw Mill For Sale

For Sale—Small Steam Saw Mill, complete with trimmers and lath mill, capacity 15,000 feet per day. Price, including mill frame of sawed pine timber, $1,500 f.o.b. cars. Reply to C. H. Sheppard, Waubaushene, Ont. 7-11

British Columbia

SAW MILL, TIMBER LANDS, MINING PROPERTIES, ETC.

Saw and planing mill, capacity 30 M. in 10 hours; six thousand acres timber, 70 million feet; mill and timber $70,000. Farm with good residences with cattle, hogs and poultry, 3,000 acres freehold land; $30,000. A responsible purchaser with about $25,000 cash can handle this, balance of payments spread a period of 10 years, or more if desired.

Also several mining properties, iron silver, gold and lead, on half share for development work.

Saw and planing mill, capacity 40 M. in 10 hours, splendid situation, rail and water transportation. Mill and plant with several good residences and fruit orchard, price $60,000. 10,000 acres virgin timber lands, estimated to contain over 100 million feet, price $50,000.

Terms—$30,000 cash, balance in easy instalments. Owner retiring from business. Apply Box 258, Canada Lumberman, Toronto, Ont. 7-12

MISCELLANEOUS

A Valuable Timber Limit for Sale

Timber Berth 1199, containing about one hundred million feet, principally spruce, of a very superior quality, well situated for economic handling. A railroad is under construction which will pass within one mile of this limit. There is big money in this proposition for the right party. Easy terms for payment. For further particulars apply to Room 1, Archibald Building, Edmonton, Alta. 10-13

Terra-Cotta Wood

This artificial product is prepared in the following manner: According to the degree of porosity it is desired to obtain, one to two parts of sawdust of resinous wood are mixed with one part of pulped china clay, and by the addition of a suitable quantity of water a plastic mass of spongy texture is prepared, which is then submitted to the strong pressure of a steel piston in a metallic cylinder. This produces cylindrical blocks 8 in to 12 in. in diameter and 47 to 75 in. long. These are first aired, then dried in a stove, and finally burnt at a white heat in a kiln and slowly cooled. The blocks are extraordinarily refractory, and are capable of being sawn, cut, planed and polished. Their density is about half that of ordinary bricks. These blocks have great strength, and are employed for achitectural purposes.

Saws Jamming in Pitch Pine

"Saws though thoroughly fixed in the machine and efficiently trimmed, with teeth having proper angles, rake, etc., are very liable to jam and run out of line when cutting resinous pitch pine," writes "A. M.". "The best and only remedy in such circumstances is to apply some paraffin or naptha oil on the saws while in action. The most resinous logs can be satisfactorily cut if this plan is applied."

The government of the Netherlands East Indies have decided to take over and control the working of all the timber forests of the Colony. Whilst the contract is in force the present holders of timber concessions will receive annually from the government the same quantity of djati trees that they have hitherto been in the habit of cutting down. In view of the circumstance that timber merchants will be obliged themselves to cut up the logs, it is anticipated that a large quantity of saw mill machinery will have to be ordered.

British Guiana Forests

The greater part of the area of British Guiana is still under forest. Nearly the whole of the interior is as yet unopened, comprising about 78,000 miles of timber land. The woodsman's axe has not as yet been heard in the depths of this forest, which is practically unknown except to the trapper. When means are afforded by railway construction of obtaining this timber, it will undoubtedly prove the most valuable asset the colony will then possess. The best known woods exported may be mentioned as described as follows:

Greenheart---A very well-known and first-class hardwood, obtained from one of the tallest of the trees of the Guinea forest. Logs can be had from 18 to 24 inches square and 70 feet long. Useful wherever a hardwood is desired, particularly for shipbuilding, wharfs, house framing, mill timbers, etc.

Moro wood.—Of equal value, though not so well known as Greenheart, and suitable for similar purposes as that wood. Being more plentiful and more easily accessible, this timber should rapidly become popular for construction work.

Wallaba.—A very useful timber, occurring in four varieties, only two of which, however, are generally used. For shingles, both for colonial use and for export, vat staves, paling staves, frames for houses and also for firewood, it is very suitable, and in good demand.

Bullet tree.—This tree produces the valuable by-product, balata, and is now only cut as timber for special purposes. It attains a height of 100 feet, the wood being dark red, close-grained and, when free from sap, most durable.

Crab-wood. — An excellent wood for furniture and cabinet making purposes, as, when finished, it resembles an open-grained mahogany, and is not so hard to manufacture as that wood. The attention of manufacturers has, within the last few years, been attracted to this wood, and systematic attempts are being made to place it on the market in quantity. A number of milling plants have been established along the rivers by which this wood is plentiful, and one concern is now supplying the New York market with large quantities. Crab-wood is worthy the attention of Canadian furniutre manufacturers.

Red Cedar.—There is a plentiful supply of this well-known wood, though the export is small. It is chiefly used for making cigar boxes.

Salt as a Wood Preservative

A note in the Chemical Trades Journal describes the results of salting sleepers, still much practised in South Russia, as a means of preservation. The discovery of the efficacy of salt for the purpose was made accidentally some twenty-five years ago. The telegraph poles of Sevastopol had a short life, rotting below the ground, and one of the staff tried the experiment of putting a pool of salt into the hole prepared for the reception of one of them. It lasted five times as long as usual, and the experiment was repeated and extended to railway sleepers. Crude sea salt, such as is recovered along the Crimean coast, is used, and in 1895 a plant for treating 300,000 sleepers a year was provided at Ssiwach, in the Crimea. This is the annual requirement of the Crimean railway, and the system has been extended to other lines—for example, that which runs across the Kergis Steppe. The treatment is specially recommended for sleepers intended for use in a hot and dry climate. The sleepers are usually thrown into ponds containing a 16 per cent. solution of salt, and allowed to stay there three or four months. They take up 70 to 100 times their weight of liquor, or about 10 lbs. of salt, which, however, does not penetrate far. The cost of the treatment is, according to locality, from one-fourth to one-ninth of the cost of treatment with creosote, and the life of the sleepers is said to be six years, against twelve for those creasoted. Under the same conditions, untreated sleepers last about four years.

I ran across a new wrinkle the other day, says a writer in the Wood-Worker, watching a new rip saw man who had been put on the self-feed. The self-feed saw was an old, antiquated one, where the only way of raising the feed-works was to turn a handwheel until it was screwed up high enough to be out of the way. Instead of doing this, he just started the board in when he wanted to edge it straight before ripping, and steered it right through, letting the rolls do the work. There may have been some knack, and probably was, of doing it, but he would have the board edged before he could have raised the rolls out of the way to do it by hand.

OILDAG
(REGISTERED TRADE MARK)
Deflocculated Acheson-Graphite, DAG, and oil.

Graphite does not dissolve in any liquid or break under pressure and these qualities, added to the unctious softness and purity together with its non-coalescing nature, make Acheson-graphite ideal for lubrication purposes. The process of deflocculation takes Acheson-graphite powder so fine that 99% of it will go through a sieve having 44,000 meshes to the square inch, and subdivides each grain of this finest powder into many still smaller particles—so small that they cannot be seen with a strong microscope. Oildag is this deflocculated Acheson-graphite suspended in oil where it neither floats or sinks but is evenly distributed throughout. Oildag will flow anywhere the oil alone will go.

Mr. Rob't. A. Ross, E. E. of Ross & Holgate, Consulting and Supervising Engineers, Montreal, writes:—

"As my firm are constructing and operating steam plants, we have wished to use a mixture of graphite and oil for cylinder lubrication, but have been prevented by the fact that the graphite settled out of the mixture. This difficulty you have overcome, and we are now assured of the best lubrication in the world, especially in super heated steam practice."

Write for Oildag booklet 77 E.

ACHESON OILDAG COMPANY
Factory at Sarnia, Canada - - Port Huron, Mich.

The National Iron Works, Toronto, Ont., covered with J-M Asbestos Roofing.

J-M ASBESTOS ROOFING
FIRE-PROOF

Made of indestructible Asbestos (Rock) Fibre and Trinidad Lake Asphalt, the great weather-proofer, J-M Asbestos Ready Roofing is literally a pliable stone. Fire, acids, gases, chemical fumes, heat or cold have no effect upon it. It is therefore practically indestructible.

And because of its stone nature, J-M Asbestos Roofing never needs painting or gravelling. Its first cost is its only cost.

Asbestos being a non-conductor of heat and cold, this roofing keeps a building warm in winter and cool in summer, and is adapted for any building, anywhere.

We'll sell you J-M Asbestos Roofing direct from our nearest branch if your dealer won't supply you.

Write our nearest branch for Samples and Catalogue 303.

Review of Current Trade Conditions

Ontario

While stock is moving more freely throughout the province, the prices obtaining are by no means to the liking of the trade. The hemlock situation is not as strong as it was, the reson for this being that Michigan and Wisconsin manufacturers have been offering stocks at close prices. The market for pine is practically unchanged with a fair stability in present prices. A noteworthy feature is the scarcity of lath. The prices, however, are not correspondingly high. Stocks of dry hemlock have become pretty well absorbed and it looks as if dealers would be taking green stock for their requirements before very long. British Columbia shingles are holding firm at $3.30. That the mills at the coast are busy is evidenced by the time it takes them to make shipments these days.

While the prices are not fulfilling expectations the stocks in the yards are low, generally, and with a little more enquiry, which is inevitable, a stiffening tendency is certain to ensue. With the fine weather the dealers have been disposing of stock laid in earlier in the year and held up owing to backward weather at that time. Operations in the building field are quite active and enquiries from this source are continually on the increase.

Those who are shipping by water are experiencing some difficulty in getting tonnage to suit their sales. There is a scarcity of satisfactory labor at all water points, both as regards loading and discharging.

One of the chief weaknesses of the trade at present is its anxiety to force business through an army of salesmen. This is having a bad effect upon the buyer, giving him a sort of unstable independence and making him frequently irritable owing to the amount of time he has to devote to interviewing travellers.

Generally, conditions at the present time give promise of a good volume of trade during the season and there are no indications of any untoward developments in the price list. The prices quoted by this journal have been carefully revised and may be taken as a fair indication of the figures at which business is being done.

Eastern Canada

With the exception of the export and lower grades, for which there is a fair demand, the movement of stock is a cause of some anxiety to manufacturers of the Ottawa Valley. The mill yards are full of lumber of last year's cut and before long some of it will have to be cleared out to make room for the new cut. For the middle grades, such as shipping culls, the demand is very indifferent, this being attributable largely to the lack of interest on the part of the American trade, the condition of which is very unsettled at the present time. There have been no recent changes in price worthy of note.

The exceptionally dry weather that has prevailed throughout the province of Quebec has tide up a great deal of lumber and unless the situation improves very shortly it is almost sure to affect the prices of spruce, pine, hemlock and cedar. The prevalence of bush fires over large areas in the northern section of the province is another disagreeable factor. As against these things, however, it is refreshing to note a feeling of greater trade confidence in the Montreal district following the efforts of the Montreal Lumber Association to put the manufacturer, wholesaler and retailer onto a better basis of operation.

At Boston the easier tone prevailing in the spruce market has caused some buyers to act more conservatively. There has been a drop of 50 cents from the $24 which was the price obtained for frames, 9-inch and under, a couple of weeks ago. A fair volume of new business is reported in the market for random, with the figure averaging about $20.50 for 2 x 4. In the market for shingles a firmer tone is developing. Offerings of choice brands are not large and manufacturers in some instances are asking fancy prices. Sales of extra choice brands have been made at $3.60, but there are few manufacturers who can get over $3.50, and buyers report they have been able to get good extras in some cases at $3.40. Clears are firmer at $3 to $3.20. Not much business is reported at the outside figure. Demand for lath has not been heavy. For 1⅝-inch prices range from $3.70 to $3.75, and for 1½-inch from $3.45 to $3.50.

The outlook for eastern spruce at New York has improved considerably and retailers and wholesalers expect a gradual upward trend during the next month or two. Prices remain unchanged at present. With an improvement in the building field a better trade in hemlock seems assured. Retailers are carrying only a moderate supply of hemlock and any strengthening in the demand from consuming sources will necessitate heavier buying.

Great Britain

While no appreciable reduction in prices is anticipated at London during the present season, trade events of the last two weeks have not fulfilled expectations. Buyers continue to exercise great caution and are only satisfying immediate requirements. It is hoped that there will be a marked improvement shown in building requirements, in which case the tendency will certainly be to harden prices in the stocks mostly required by that industry. Meanwhile, the deliveries are moderate, those from stock being a little less than last year, while the overside are over 500 standards less, but with so many of the ports now being open, this shortage will not doubt very shortly be made up. The packing trade shows a lull, and the building demand is still very moderate.

At Foy, Morgan & Company's recent sale at the Cannon street Hotel, London, a fairly brisk demand was evidenced and results generally were satisfactory. In pine, 13 ft. 3 x 11 1st Quebec went £35, 3rds at £15 5s., and 4ths at £11 and £10 15s. Large Quebec birch made 102s. 6d., 20 to 22 in. 90s., and under 81s. 3d.

At Liverpool the stocks on hand are, with some minor exceptions, much below those held in previous years at the beginning of the regular import season. In spruce deals for instance, Liverpool stocks are about 35 per cent. less than last year at this time, and in Manchester nearly 25 per cent. less. The reduced trade at Liverpool, of course, is caused by the opening of navigation in the St. Lawrence, the liners which have been running to St. John, N.B., and Halifax, N.S., having been transferred to their regular summer employment at Quebec and Montreal. The regular small shipments of spruce to Liverpool have now ceased and the trade has to depend upon the contracts which have been made for future arrivals. Spruce deals are quoted at £8 5s. c.i.f. for the Mersey for large steamers.

The demand on the spot market is not altogether satisfactory, although prices remain firm. The anticipated improvement in the building trade has not materialized and the present demand continues on the same hand-to-mouth principle which characterized it during the earlier months of the year. There is rather a large stock of St. John, N.B., birch logs and planks, but this is attributable to somewhat heavy arrivals from that port late in the spring. Prices for birch remain firm, both in the c.i.f. and spot markets. The first shipments of pine deals and lumber from Montreal are going direct from the steamers' side into the hands of the country dealers, in fulfilment of contracts made during the winter. C.i.f. values for pine deals are firm with a tendency to stiffen for the higher qualities. Stocks of the lower qualities are rather heavy but are held firmly.

Trade continues on the easy side at Manchester. Quebec board pine has received little support and the present stocks would appear to be ample. Pine deals are also well stocked. Quebec thirds have gone very slowly of late as they have had to face competition of three-ply and the cheaper grades of canary whitewood.

The condition of the market at Glasgow is on rather an unsatisfactory basis so far as the volume of business passing is concerned. The demand from the shipbuilding industry has been unaccountably dull. That considerable quantities of wood goods will be required sooner or later is practically certain but the demand is very slow in coming. Among recent arrivals at this port may be mentioned the "Saturnia" from St. John, N.B., which had 4,941 pieces birch, 3,961 pieces spruce deals, 221 pieces pine, 24 logs maple, 2,813 bundles maple, to order.

United States

The market on the other side of the border has not been featured by any noteworthy changes since the publication of our last report. There has been little attempt to stock up in advance of current requirements and the demand for lumber in both the wholesale and retail departments is very moderate. Speculative buying has been conspicuous by its absence, except in the case of southern pine timber, which has been brought up to some extent in anticipation of higher prices. While the amount of lumber distributed is somewhat less than usual at this time of the year the demand is fairly well maintained, this being attributable largely to the activity in the building field. Generally there is a reluctancy to take any chances on the market, which at present gives no justification for stocking up beyond requirements. The lack of railroad demand has cut down the volume of trade, but fortunately this has been offset by a curtailment of cut by the southern mills.

The general lumber industry of the whole country is distinguished by a restriction of output on shipment. At no point is this demonstrated more forcibly than at Chicago, the great central market, where the total shipments for the year computed up to May were 260,380,000 feet, compared with 350,588,000 in the corresponding period of 1910—a falling off of 90,178,000 feet; and the trade happenings at Chicago are a very fair barometer of the whole industry. It is felt that under the circumstances the only way to maintain firm prices is to restrict the output to current requirements; further, that

J. M. Diver, General Manager
E. C. Barre, Assistant Manager

this is a period for the suspension of judgment and waiting for controlling events. This is about the attitude of producers, sellers and buyers of lumber.

At Chicago, prices for southern pine are well maintained, this being attributable to the fact that there is considerable building in progress. The demand, however, is not such as to satisfy wholesalers who handle timber bills for heavy construction. Enquiries from the railroads are scarce, with but little buying. In northern pine the same conditions obtain, and local dealers complain that there is little money in the business at prevailing prices. The demand for hemlock has revived somewhat, but here again sales would be larger if building activity were more in evidence; as it is, dealers are buying only what they require to even up assortments. The red cedar shingle market at Chicago is still a dull feature. If anything, prices are a little firmer, clears ranging from $3.12 to $3.17 and stars $2.59. The demand for white cedar shingles is a little more active and the market for lath has improved somewhat owing to the influences of spring building.

Buffalo reports a good market for southern pine. The mills, as a general rule, have plenty of orders and the retail trade shows improvement. Prices for hemlock have shown little variation but there has been a large demand for rail hemlock. The better grades of white pine are still scarce with prices for most grades firm, although low grade pine shows little improvement. Stocks of red cedar shingles have begun to arrive in quantities by lake but there has not been much change of prices, these having been low for some time.

The most striking feature of the present situation in the lumber industry and trade is that in the southern pine field. At the begining of the year the mill operators spontaneously and almost unanimously set out to obtain better and more uniform prices for their product, since they had been manufacturing at a loss and self-preservation made that resolution necessary. It would seem that if the demand for southern pine this season had been heavy and insistent on stated delivery it would have been comparatively easy to maintain and even advance prices. But the contrary has been the fact. There has been an absence of urgent demand by the larger interests, which have been in the habit of placing contracts for large blocks of product, to be cut and delivered over extended periods of the year, and employing a large share of mill capacity. The manufacturers of southern pine have had to depend mainly on the building demand in the cities and on the country retail trade for their outlet, which has limited the requirement markedly as compared with that in years of large railroad, car work and industrial demands in certain lines. Yet with such a restricted market the mill operators have been able to maintain prices to a remarkable degree. But they have done this by a curtailment of product. In the territory west of the Mississippi the larger mills for months have been running not more than five days in the week, and some of them have cut down the running time to three and four days in the week. Labor and other hindrances have curtailed a normal output of lumber. Altogether there has been a positive and widespread reduction of capacity cut, and without doubt, with anything like a normal fall trade, will be found a pronounced scarcity of lumber, especially such as is used in the retail trade. In that case the manufacturers will be in a position not only to maintain the present level of prices but to advance them all through the list. In that case the time will come when it will be wise to buy stocks for speculation; but the buyer will be wise who will be able to determine when the right moment has arrived.

Cooperage Trade Improving

Chatham, Ont., May 25.—J. Innes, of the Sutherland, Innes Company, Limited, has the following views on conditions in cooperage industry:

"There is a considerable stiffening in prices of cooperage stock all along the line. The consumers are beginning to realize that the output this year is going to be a very limited one.

"Trade generally is improving, and the prospects for a good apple crop are excellent. Nearly all of the manufacturers are therefore very optimistic and are looking forward to not only an excellent trade but for much higher prices than are prevailing at the present time.

"There was a little slump in hoops, but this has recovered and staves and heading are not only firm but prices are advancing."

Eighty-eight timber licenses were issued for lands west of the Cascades during April, producing a revenue to the province of British Columbia of $12,400; 456 licenses were issued for lands east of the Cascades, bringing in a total of $52,440; timber license transfer fees during the month amounted to $450, penalties aggregated $1,075; coal license fees totalled $5,150, and coal license transfer fees, $160, making a total revenue for the timber branch of the provincial lands department for the month of $71,675.

The Government's Reserve Policy

In the course of a recent debate i nthe House of Commons, the Hon. Frank Oliver, Minister of the Interior, gave an explanation of the new Forest Reserves Bill. The purpose of the bill is to revise the present Act. It is proposed to place the whole of the eastern slope of the Rocky Mountains in the position of a forest reserve. Under the bill there are 24 reserves with an aggregate area of 16,760,640 acres, as compared with 21 reserves with 3,379,200 acres under the present act. Referring to the policy of the government in connection with these reserves, Mr. Oliver said:

"We do not propose to hold the timber which is in these forest rseerves from use, but we propose to inaugurate a policy which will look to the utilization of the timber and to the reforestation or continued forestation of the land. We have not arrived at that point yet but we hope to do so. In a great measure the public requirements are met by the holders of timber licenses inside and outside the forest reserves, but our purpose, in dealing with the timber in the reserves is, first, the economic utilization of the timber which is useful for commercial purposes so that there shall be a continuous supply.

"The primary object is to conserve the sources of water supply by the protection and production, or reproduction, of timber or wood around the sources of the water supply. It is to be supposed that the sources are elevated areas, otherwise hills, and, they being elevated areas, are not the mist desirable areas for agriculaural purposes. We propose to utilize that land which is, under ordinary conditions, either waste or of much lesser value in this work of conserving the water supply, and at the same time to reproduce the timber growth for the benefit of the dwellers on the prairie surrounding these areas.

"We hope that we will be able to work out a system such as they have adopted in other countries of harvesting our crop, and still having another crop to havest, all the while protecting the cources of water supply as they can only be protected by some measure of forest growth. We must always recognize that timber in our own western country is of special value. It is worth so much per thousand feet, but it is worth a great deal more than any actual economic value, in the settlement of the country. While it is desirable that we should see that the sources of our water supplies are preserved it would not be possible for the government— at least I do not think it would be possible—to sit tight and say: We will not allow this timbe rto be utilized. I know that in order to meet public opinion, even if we had no other reason, we would have to provide for the utilization of the timber as it reached the point when it was most useful as a commercial article.

"It is the intention and policy of the department, to see that the cutting of timber inside the forest reserves is done in conformity, not only with the license that has been issued, but also with our general regulations for cutting timber within forest reserves."

The Rothfuss-Howard Iron Works, Williamsport, Pa., are always thoroughly up-to-date both in their products and in their business methods. An indication of this is afforded by the attractive little monthly calendars which they sent out to their business friends. The calendar for the month of May is decorated with a dainty picture of a young lady enjoying the sport of trout fishing. The calendar is prettily designed and bears the following very practical text for the month: "May—The glorious month of May! Everyone should be happy, and if your steam shovel or locomotive is making you unhappy, let us remedy it. We rebuild locomotives and steam shovels." This is good practical advice for all users of steam shovels, etc. The Rothfuss-Howard Iron Works are also sending out a dainty blotter with a reproduction of a landscape painting produced in color.

English investors have recently been invited to purchase stock in the Canadian Timber Investment Company, Limited, of which the capital stock is £400,000 and of which 150,000 shares of £1 each are being issued at par to the public. The company has been formed for the acquisition and holding of timber properties in Canada and elsewhere and primarily for the purchase of properties in British Columbia, comprising 97 leases or licenses upon approximately 96½ square miles. The properties were acquired by the vendor, Mr. C. F. Pretty, of Vancouver, to whom is being alotted 60,000 shares, in part payment for the properties. The properties are estimated to contain 1,341,730,000 feet of merchantable cedar, fir and spruce.

The National Wholesale Lumber Dealers' Association have appointed a special standing committee of five members to advance the cause of a single standard set of rules for the universal inspection of hardwood lumber, according to a resolution recently adopted at the annual meeting of the Association. The committee consists of the following: Lewis Dill, chairman, Baltimore, Md.; R. H. VanSant, Ashland, Key.; O. O. Agler, Chicago, Ill.; R. M. Carrier, Sardis. Miss.; E. V. Badcock, Pittsburg, Pa.

DRIED FRUITS

It is going to be no easy task to supply the camps economically this season with apples, prunes, raisins, peaches, etc., at the highest prices that we have ever known, but we can help you out to a considerable extent by being able to offer you a fine line of natural figs, packed in 28 lb. bags, at the remarkably low price of 3¾c. This particular line is good, clean, sound fruit. We also have three other lines of better quality which we offer at 4, 4¼, and 4½c. To those who have not used figs in the camp, we can only say that they offer a splendid substitute for and can be used for practically all the same purposes as apples, prunes, raisins or peaches.

Samples on request.

Trade in the United Kingdom

(Continued from page 40.)

tional details of a lofty stand of four storeys and a roof have been given. Many structures of the kind, to accommodate large numbers of people, have been erected in London, and have used up a tremendous lot of timber, much of it being of a heavy kind. The larger structures have been strongly built, under the supervision of the city of Westminster and city of London officials, and the timber used has had to be suitable for the purpose. Timber of the roughest and poorest quality has been used, almost by the ship-load, and for much of the work timber of the kind is as good as any. But for weight-carrying and for uses of a critical kind, the timber was required to be of sufficient section area, and of ample strength for the work. The stands which are being constructed at the time of writing appear to have a large surplus of strength, timber of the heavier kind being used without stint. The principal work of the kind is, of course, being done in London, for there the Coronation will actually take place. But fetes and galas on a large scale on a large scale will be held all over the country, and for these, stands, temporary houses of all kinds, inclosures and barricades, are now being erected on a large scale, so that the demand for timber for these special coronation purposes is now great. One wonders what will come of the timber after that eventful 22nd of June. Much of it will be little worse for the use it will have been put to. A good deal of it will find its way back into merchants' and dealers' hands, and it may be predicted that some profitable business will be done in timber which will have been used for coronation structures and barricades. One will be able to buy such timber at one's own price and a large proportion of the timber used will be bought "as it stands" and taken away to be sold again as new, first hand material. But without doubt the movement of timber for coronation uses will be a good thing for importers and merchants as most of them will not take the timber back again. At the time of writing the output of timber on this account has not quite reached its height. Many of the larger structures are in hand, but a vast number of the structures, small and great, and the final barricading, have yet to be done. The trade is not yet, accordingly, quite feeling the full demand for timber on coronation account. That will come with the first week in June.

One piece of work of the kind deserves especial mention. A huge and elaborate stand is being erected in front of the Borough Polytechnic, in south London, as an important function of the celebration is to take place at this point. The royal procession will halt at the front of the Borough Polytechnic, and the King will receive addresses from nine mayors of the Borough of London. A great crowd of people will want to witness this part of the ceremony, and a great structure is being erected to accommodate them. The stand is being built by C. H. Glover & Co., of Ormside street, Hatcham, and Clement's Lane, London. The charges for seats will range from one guinea to six guineas per seat, though the higher priced tickets cover the cost of a suitable coronation luncheon. Messrs. Glover & Company have considerately made arrangements by which members of the timber trade may secure seats at a substantial discount on the ordinary prices, so that any members of the trade who are pleased to avail themselves of the opportunity presented by this big stand at the Borough Polytechnic will be able to witness one of the chief civic functions in connection with the great event to best advantage.

Terms of Credit

This topic, which has occupied the attention of timber importers and merchants for the last year or two, and which has lately become one of the pressing topics of the trade, received special attention at a meeting of the Executive Committee of the Timber Trade Federation of the United Kingdom, held on April 28th, at the office of the London Chamber of Commerce. The terms of payment in common use among merchants and traders were reviewed, the common practice of payment being made within a month, being especially emphasized and being spoken of very favorably. The growing laxity of recent date, by which dealers have broken away as it were, from the recognized periods of payment, and paid when it seemed to please them, was strongly deprecated as being doubly unfair to merchants. It was unfair as holding back payments which were supposed to be prompt, cash payments, until late dates, and it was unfair as deferring such payments until unknown dates, so that merchants could not count on them with any certainty when trying to arrange for payment of their own bills. The committee saw that the question was a large one, and that there arose out of it some delicate considerations. It was ultimately decided to appoint a special sub-committee to deal with the matter, and to have representatives of the principal ports on the sub-committee, that the views of the trade in different parts of the kingdom on the subject might be ascertained and form the basis of a rule or set of rules to be laid down for the guidance of the trade.

TALK NO. V.

It is absurdly easy

to make a lot of fine resounding assertions about the "AMPHIBIA" Water Proof Belt. Any man with an extensive vocabulary could do that about any weak-knee'd proposition.

But we're out to convince you, so here's a definite offer.

We will send to any responsible firm

ONE "AMPHIBIA" BELT

on trial and if it fails to do as we state, it can be returned and no charge will be made.

Now, advertisers sometimes make offers which have a nice open-handed appearance, but which it would'nt pay them to get accepted.

But our offer, as outlined above, has been accepted and

Not one belt has come back

One customer says that it lasts five times as long as any other belt he has ever used.

Enough to make you think, eh?

Remember, "AMPHIBIA" is waterproof and made from first-class oak leather.

ONEIDA,

The Steel Pulley of better belt contact, lightness, maximum strength.

Oneida Steel Pulleys differ from any similar produce made. And in this difference lies their strength,

In construction the Oneida Steel Pulley is ideal. It is strongly reinforced, is lighter than any other steel pulley by ⅓ to ½ and possesses greater strength. The perfectly oval crown face insures a 20% better belt adhesion.

They are built in the greatest range of sizes of any steel pulley in the world, from 6 in. to 126 in. with 2 in. to 40 in. face with ¾ in. to 8½ in. bore.

EDGINGS

Ontario

The St. Anthony Lumber Company, Limited, Ottawa, has applied for authority to surrender its charter.

The Belgo Canadian Pulp & Paper Company will erect an addition to their plant and install another paper machine.

Frank J. Pitman, representing Cornell & Ward, manufacturers of toilet papers, New York city, was in Toronto recently.

J. R. Booth will drive 50,000 cords of pulp logs from Elk lake, in the Nipissing district, and has built piers and guide booms across Mountain lake to keep the logs from scattering.

Incorporation has been granted to the Union Lumber Company, of Toronto, with a capital stock of $50,000. Robert C. McKay, Gideon Grant and Andrew Dods are the incorporators.

At Perth, Ont., bush fires swept over 400 acres of timber land and wrought damage to the extent of many thousands of dollars. The loss was confined to the property of Wm. Butler.

G. H. Nicholson, of Freelton, has purchased a half interest in the lumber business formerly carried on at Burlington by Alan S. Nicholson. The new firm will be known as the Nicholson Lumber Company.

At the recent examination of the Faculty of Forestry of the University of Toronto, forty-five students wrote on the different subjects. All have secured positions as fire rangers or with lumber companies during the summer months.

At Milford Bay, Muskoka, on the site where the serious mill and lumber fire and boiler explosion occurred a few seasons ago, Mr. John Glass is now busily engaged operating a small mill with very complete equipment. A modern planer was installed this spring.

The city council of Port Arthur, Ont., have closed an agreement with J. L. MacRae for the erection of a hardwood finishing plant. Operations will be commenced at once. The plant will entail an expenditure of $60,000. The city will guarantee bonds to the extent of $35,000.

Ritchie & Ramsay, Limited, coating paper manufacturers, Toronto, have plans under way for a large addition to their present plant, and will install several new machines. The mills have enjoyed a very busy season, and it is said that the present capacity will be practically doubled.

A serious fire occurred at the Baker Lumber Company's yard at Lindsay, Ont., last week. Over a quarter of a million feet of beech and hemlock lumber and half a million shingles were destroyed. A G. T. R. car filled with shingles, was also destroyed. The loss is estimated at about $8,000.

A blaze occurred recently at Matthew Cowper's planing mill at Thamesford, Ont., but owing to the efficient work of the bucket brigade, in which nearly every man of the village was enlisted, little damage was done. The mill had a mica roofing and the fire resisting quality of this material kept the kiln and drying room intact.

The Continental Bag and Paper Company has been building a new factory on Bridge street, Ottawa, but has been kept back considerably by delay in delivering machinery. However, the management declares that operations will be commenced at the end of the month. The capacity of the factory is three million bags per day, and prospects seem particularly bright.

The large mill of Mickle, Dyment & Son, at Gravenhurst, commenced sawing for the season on May 8th. Two large double band saws, a band re-saw and a Wicks gang saw are cutting 100 M. feet per day. This year a 50 h.p. electric motor is running the planing mill and a 100 h.p. motor supplies power for the re-saw and lath mill. Manager Anderson is paying special attention to fire protection this year, and besides the system of hydrants, in connection with which a combination motor pump supplies water from Muskoka Lake, there are 120 buried water barrels distributed throughout the yard, each indicated by a white three-foot head-board.

At a recent meeting of the bondholders of the Imperial Pulp and Paper Mills, of Sturgeon Falls, Ont., held in Toronto, it was decided to make application to the courts for permission to sell the plant, and it is expected that the auction will take place about the middle of June. The limits will be included in the sale. They cover an area of 2,760 square miles and comprise 4,000,000 feet of standard spruce and 9,000,000 feet of other timber. E. R. C. Clarkson is the receiver. The mills have been in liquidation for two or three years. The ground wood plant is being operated, and eight grinders of the twelve in the mill are running at present.

The Bain Wagon Company, of Woodstock, Ont., will build a large extension to their plant. Plans are now being drawn for these extensions which will consist of a building four storeys high, 125 feet long and 50 feet wide, the addition to be built to the north of the present factory. When this building is completed it will mean an increase of from 50 to 75 hands, which, with the number on the pay-roll at the present time, will make a total in the neighborhood of 400 hands. This is the largest in the history of the institution. During the coming summer the company will also erect a large storehouse in Western Canada, either in Winnipeg or Calgary, to facilitate the supplying of orders for the territory west of the Great Lakes. Heretofore all these shipments have been made direct from Woodstock.

Forest fires have been active in the region of Fort Frances, Ont., and have been the subject of considerable anxiety to lumbermen and loggers with timber out and ready for the drive. On the Duluth branch of the Canadian Northern, between Ericksburg and Virginia, the fires have been raging with disastrous effects. The village of Ray was withan an ace of being wiped out on Saturday, while the bush a little further south was completely burned. Fires are also raging south of International Falls and along the Minnesota border, which threaten to be a repetition of those last fall. No great damage was done on the Canadian side, although fires are reported at Frog Creek, north of here. Timber cruisers who have returned from the Quitico forest reserve, Hunter's Island, say that fires are again breaking out there, and unless rain comes soon great damage will be done to the big timber, which is held by the government as a protection to the game preserve.

Eastern Canada

At Southampton, N.B., forest fires of considerable magnitude are reported to be raging. A large force of men is on the scene.

The Dorchester Lumber Company are building a large store at St. Malachie, Que. This building will be the largest and most modern of its kind in that section.

Rcent incorporations at Montreal include the Upper Fraser River (B.C.) Lumber Company, Limited, capitalized at $2,500,000. Among the incorporators are F. G. Bush and G. R. Drennan.

W. H. Wiles has been appointed foreman of a department in the plant of the New Brunswick Pulp and Paper Company's mills at Millerton, N.B. He has had several years' experience in England and Italy.

The saw, planing, and lath mills of the Rhodes Curry Company, Limited, of Amherst, N.S., situated at Little Forks, were completely destroyed by fire on May 16, entailing a loss of $25,000, partially covered with insurance. This was one of the largest and best equipped mills in the Maritime Provinces. The output last season was two million feet.

J. A. Gregory's sawmill at Lepreaux, N.B., was again destroyed by fire last month. The mill was insured for $3,000, about half the loss sustained. Mr. Gregory was away on the drive at the time of the fire, but his men recovered the lumber piles which contained a large quantity of sawn lumber. The mill was destroyed by fire only three years ago.

According to a dispatch from Fredericton, N.B., the Ashland Lumber Copmnay had 10,000,000 feet of lumber hung up on the Machias last month. This included 3,000,000 feet which was hung up last year, partly owing to the blow out of two dams. Hilyard's drive on the Tobique is also reported to have been hung up. A more recent dispatch from Andover says: "Red Rapids logs running, but Hilyard's and McNair's drives all out. Plaster Rock drives all hung up along Two Brooks and Burnt Land Brook. No information about Fraser's. A very small portion of lumber from the Tobique has reached the main river."

At a recent meeting of the Laurentide Paper Company at Montreal, the directors were authorized to apply for supplementary letters patent extending the powers of the company as follows: The incorporation of a new company with an increased authorized capital sufficient to meet the requirements for future extensions of the company's business in all its branches. The new company will acquire the shares, and as soon as practicable the entire assets and undertakings of the present company, upon such terms as will afford every shareholder of the present company fair and equitable treatment. The capital of the new company, it is understood, will be $10,000,000.

Western Canada

During April the Western Canada Lumber Company, at Fraser Mills, B.C., cut 10,073,613 feet of lumber, the greater part of which found its way to the prairie markets.

A pulp mill may be erected in the Masset district, near Prince Rupert, B.C., by the British-Canadian Lumber Corporation, which has recently been organized for developing large timber tracts.

L. O'Connor, of the Canadian Forestry Department, left Edmonton last month for the Peace River country. He will prepare an exhaustive report with regard to the vast timber resources along the banks of the Athabasca and Peace rivers, and adequate methods for their protection.

H. D. Prettie, forestry superintendent, was in Calgary recently to complete the arrangements for the large forestry nursery which the C. P. R. is to establish at Cluny, Alta., between Bassano and Gleichen. Large gangs of men are at work along the right-of-way of the Canadian Pacific Railway, between Calgary and Winnipeg, setting out young trees brought from the nursery in Saskatchewan.

The work of safeguarding the forests of British Columbia against depredations by fire will this season be placed under the direction of an expert commission of three members, Chief Fire Warden Gladwin (who was in charge last year), being one of these. Upwards of twenty-five divisional wardens have been in the field arranging forestry protective machinery since April. A force of approximately 150 men in all will be engaged this season by the Provincial government.

The worst forest fires in the history of Saskatchewan raged last month in that province and at one time the city of Prince Albert was seriously endangered. Among the worst sufferes were the Prince Albert Timber Company. According to an advice from Winnipeg, Man., the line of fire extended from Dauphin, Man., to Prince Albert, a distance of 100 miles. The C. N. R. had a million dollars invested in lumber mill plant at Big River. The extent of the damage at that point has not yet been disclosed.

The Northwestern Timber Company, composed of Connecticut men, have purchased about 250,000,000 feet of standing timber in British Columbia. At present they are investigating the best manner of developing their property. Hon. E. J. Lake, who is vice-president and general manager of the company, has been in Vancouver for several weeks this spring making preliminary arrangements. The company will operate in or near Vancouver within a year, but as yet they have not reached anay definite decision as to the extent or location of their operations.

The mill owners along the Saskatchewan at Edmonton, Alta., have everything ready to receive the first log drive of the season from the lumber camps up stream, the advance guard of which is expected hourly, at time of writing. More than 20,000,000 feet of logs will be disposed of by the local mills this season, as in addition to the 15,000,000 feet cut by the lumbermen during the past winter there are 5,000,000 of last season's cut logs that were stranded in the mouth of Poplar Creek last year and unavailable by the continued low water. It is expected that these will be floated this year. Between fifty and sixty men are employed in the camps up stream at the present time. They are engaged in getting the logs ready for launching in the waters of the Saskatchewan on their long journey to the Twin Cities. Notwithstanding the fact that a large amount of time and money have been expended on the construction of booms at Goose Island Encampment, for the storage of logs that cannot be taken care of in the booms of the local mills, the booms and the dam at the up stream point will be of no use whatever to the lumbermen this year. Construction work at Goose Island will be continued this year under the supervision of F. G. Goodspeed, a Dominion government engineer of public works, who has made his headquarters in the Alberta Block on Jasper avenue west, Edmonton.

The Barnhart Log Loader

has been in successful operation in all parts of the country for twenty years and never caused a complaint. We are now manufacturing a new Barnhart Loader known as **Model "12,"** which is specially designed for use in very heavy timber. This loader is built on the same lines as the old Barnhart Loader now known as Model "10" and which we still continue to manufacture. We are operating lumbermen, producing 200,000,000 feet of lumber per annum and we use the Barnhart Loader exclusively. Could we afford to do so if it were not the best? Write us for prices.

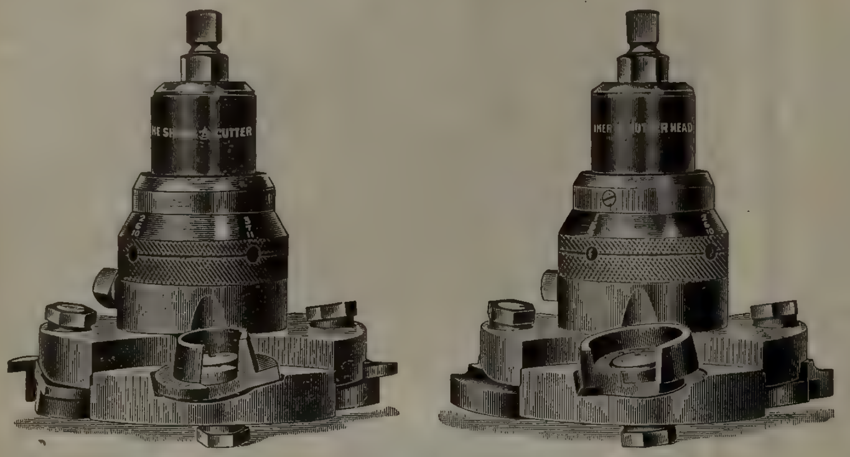
Shimer Cutter Heads and Cutters



Our "Best of All" Figs. 202 and 203 with 4 Bits to each Head.

Flooring Possibilities

The progress made by manufacturers of Flooring is in evidence all around us. The changing from the old type of floor to the modern sanitary idea of smaller units, close fitting joints, and the artistic display made by combining different colors, has led to the use of many woods heretofore thought unfit for the finer varieties of Flooring.

Maple and Oak have been the favorites, but the system of manufacturing Hard Wood Flooring made possible by the Shimer Cutter Heads, is being taken up by the manufacturers of beech, birch, ash, gum, yellow pine, white pine, tupelo, etc., and some striking effects are predicted.

Even the upstairs floors and the kitchen of the modern residence are receiving more attention, and the wood-worker who is supplied with the latest Shimer Cutter Heads, and has a taste for originating striking effects, can reap a good harvest in his locality by making his native woods into some of the novelties demanded by architects and builders.

To cut all kinds of wood smoothly, and at a good rate of feed, requires a tool with the proper cutting angle to the Bits, the proper clearance to prevent friction and burning, and many other points only understood by those who have made a life-study of the needs of the machine woodworker.

It matters little what the modern floor is made of so long as it is a substantial, durable wood and one that will finish well and we would advise every planing mill man to look into this matter.

Many property owners are also laying new thin flooring in narrow strips over their old and unsanitary floors. The business is developing right along and should be a profitable line for any planing mill. The way to make it successfully and profitably is to use the Shimer Double Flooring Heads and then re-saw the strips. This practically doubles the capacity of your matcher or moulder, giving you 100 per cent gain in output for the investment of only a few dollars.

We are here to be of service to you and our experience is placed at your disposal. Let us hear from you to-day.

We manufacture Special Cutters of any shape and size desired after the patterns of our Reversible and One-Way Cutters. Let us have your specifications. For odd work not found in our caatlogue send a wood sample or drawing.

We make two styles of Grinding Machines to lighten and hasten the work of the filing room. Particulars sent upon request,

OUR "BEST OF ALL"

The most popular of The Shimer Cutter Heads are Figs. 202 and 203. The Bits are held within conical duplex bit seats, self-centering, arranged with the very complete Expansion feature for the fine adjustment of tongue and groove thicknesses.

Price with 4 bits to each head, the set $40.95
Price with 6 bits to each head, the set 49.27
Price with 8 bits to each head, the set 57.60

Complete with Flooring Bits. The Heads will also receive Bits for thin Ceiling—⅜ at $1.30 each and Bits for 2-in. thick plank at $1.63 each.

Jointer Heads

For jointing plain edges we make several styles of Jointer Heads provided with shearing effect to produce the easiest and at the same time the smoothest work. Made of Steel Forgings they supply the strongest and best. Our very reasonable prices put the tools within the reach of all.

Price, with 4 bits to each head, the set, 1¼-in. $31.20
Price, with 4 bits to each head, the set, 2-in. 33.28

Ship Lap Heads

to give you the best service must be of a kind that is always ready and to interchange with matcher and other Heads you may have fitted to your machine, thus avoiding a change of machine guides. This is one reason why the Shimer Ship Lap Heads are so generally used. The other reason is that they do work so satisfactorily that all who know their convenience take them in preference to others.

Price, with 4 bits to each head, the set, 1½-in. thick $34.84
Price, with 4 bits to each head, the set, 2½-in. thick 35.88

Double Ceiling Heads

These heads have a special design to suit the purpose of double tonguing and grooving, with overlapping of the bit cutting edges to produce perfect clearance and to protect the leading points from unnecessary friction and wear.

They double the capacity of any matcher or moulder and provide a means of turning out single surfaced ceiling or flooring upon the most economical basis.

Price, Double Ceiling Heads complete with Bits, net, $40.94

The Shimer Cutter Head for O.G. Batten and Siding

These heads are especially designed to work O. G. Batten or O. G. Siding, having three circular cutters in line of the cut, seated and firmly bolted to one side of the head flange.

We make them to suit any matcher or moulder. They turn out O. G. Battens as regularly as our matcher heads work tongue and groove flooring. Give measurements same as for flooring heads; or, if flooring heads are already in use on your machine, give their record numbers, and send a cross section of the batten—wood sample or drawing.

Price for each Cutter Head, without bits.. .. .. $9.75
O. G. Batten Bits to mould ¾-in. deep or less, net each 2.08

Door, Sash and Coping Tools

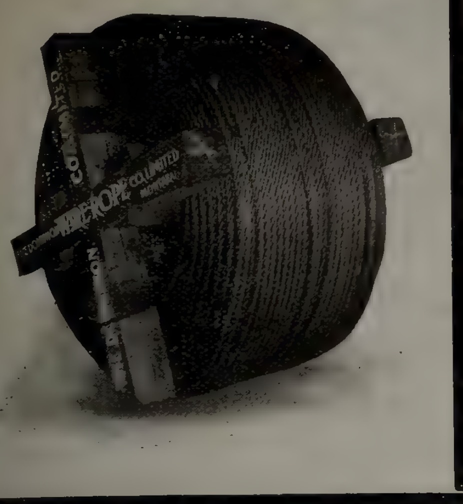
That save all the hand fitting. No changing of patterns, therefore, no trouble in framing the door and sash parts when they are matched up with the Shimer Cutter Head. We relieve you of that detail of the business when we place the mould in counterpart within the contour of the Bits. The Bits are filed only to sharpen and being set by means of a gauge give accurate and uniform results. Prices very reasonable.

Reversible and One-way Cutters

The Shimer Reversible Cutters for Single Spindle Shapers, Variety Moulders or Friezers, are carefully moulded opposite to the shape of the mould to be produced, in such a way as to have only the cutting edge touch the lumber. They are complete—inexpensive—time saving. We also make One-Way Cutters for the Double Spindle Shaper.

SAMUEL J. SHIMER & SONS

Branch at Milton, Pa. **GALT, ONTARIO, CAN.**



Wire Rope

When you need wire rope for any purpose whatever, it will surely pay you to communicate with us.

We have in stock all kinds—in all sizes—in any length.

Should your requirements be special—we can make rope to exactly suit your needs. We know how, as we have had years of experience.

Wire Rope Fittings of all Kinds

The Dominion WIRE ROPE Co., Limited
MONTREAL

Jeffrey Wire Rope Conveyers

Are used extensively in the lumber industry

Because

They have greater efficiency and are more economical than other types of conveyers.

They are pre-eminently fitted for medium and long distance haulage; are employed with greater success in handling Lumber, Logs, Refuse, etc.

We have conveyors of this type exceeding 1,000 feet in length which are in successful operation.

Write for Booklet 33

We build Conveying Machinery for all requirements in the Lumber Industry.

The Jeffrey Mfg. Co.

A Band Mill Without a Peer

Best balanced and most symmetrical band mill ever designed

The despair of imitators
Built with 6, 7, 8, 9, 10 and 11 foot wheels
Does not overhang its foundation
Is the heaviest band mill built
Also the perfection of simplicity
It holds all the cutting records
Has the greatest range of top wheel
Double spring cushion tension device
Steam straining engine when specified
Quick opening bottom guides
Bottom guide completely buried in husk frame
Safety upper guide
Steam controlled upper guide when wanted
Steel spoke V section bottom wheel
Chain oiling bearings
Hubs are longer than on any other brand
This insures a very rigid wheel
Wheels tilt from front and rear
The standard of excellence
Every feature original with us
We build every machine required in an up to date mill

PEMBROKE, Ont., Canada

Manufacturer of the best line of Lumbering Tools in Canada

Fenwick, W. Va., June 23, 1910.

HENRY DISSTON & SONS, Philadelphia, Pa.

Dear Sirs:

Enclosed you will find check for the Crosscut Saws. Will mail you photo of the cutting crew and I will say the **Disston Crosscut Saw** is the best Hardwood and Hemlock Saw I have ever used and I have cut timber all my life.

Yours truly,
C. MARKLY.

In the foreground will be noticed two logs, one of which is of the knurly or spiral grain species, while the other is exceedingly knotty, showing two classes of timber which test the metal, temper and workmanship of saws more severely than any other known class, and as Disston Saws are successfully cutting this kind of timber, it is self evident that they are of the highest quality in every respect, as confirmed by Mr. Markly's letter.

FOR RESULTS USE DISSTON SAWS

When you want

Leather

We are the people

Ask for the

Round Knife Brand of Harness Leather

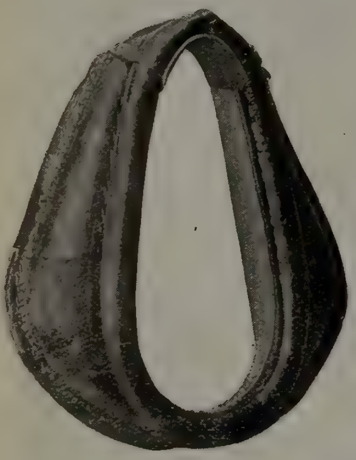
ROUND KNIFE BRAND

Leather of quality bears this stamp. It has no equal.

Lace Leather

"B. B. Lace"

In sides or cut into laces any width required. It has stood the severest test—strong,—pliable and durable. We tan and finish it ourselves and stand behind it.



Our Lumber Horse Collars

Are made on scientific lines to fit the horse. May be had with the Gall Cure Curled Hair Pad when required.

We make all kinds of horse collars, short or long straw.

If you want satisfaction get our make. Handled by all reliable dealers.

If they don't supply them send to us direct.

Oil Tanned Mocassins and Sporting Boots

We surpass all other makes on the market.

tyle No. 407

WHY?

Because every pair is made with our Patent Heel which insures against running over and ripping at the heel like other makes.

It acts like the stiffener in your boot but is easy and pliable and has no rough seams to hurt the foot.

All well made and of leather of our own tannage.

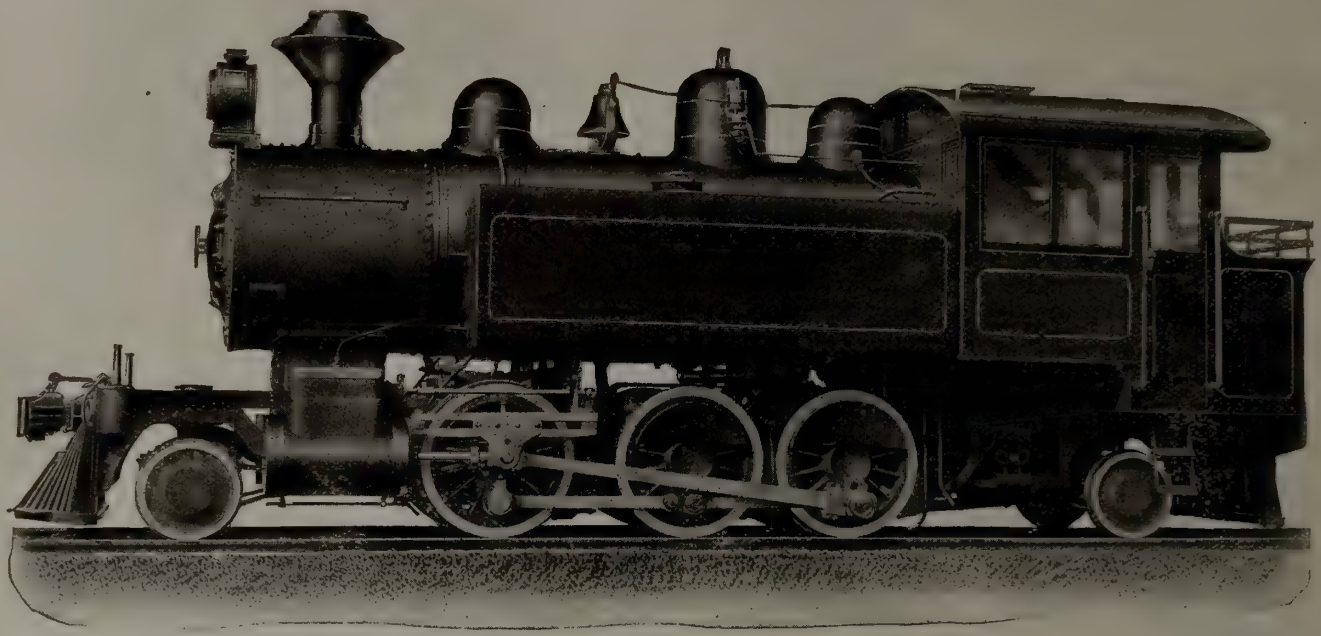
ADAM HALL, Limited - Peterborough, Ontario

Manufacturers of Ranges, Heaters, etc., for Lumber Camps, Hotels, and Railway Construction



LOGGING AND INDUSTRIAL LOCOMOTIVES

The knowledge and experience gained in building locomotives of all types, capacities and sizes for every kind of hauling is applied to every locomotive we build, and is available to you.

Our small locomotives for logging, and light switching service are not merely selected from designs previously built, but are special designs to meet special requirements.

They are designed and built with the same care required for 200 ton locomotives. Only the best materials are used in their construction, and every part is made to jigs or templates, guaranteeing that repair parts will fit.

They are constructed with a view to the fact that they must sometimes be operated a considerable distance from shop facilities, therefore simplicity and sturdy construction are vitally necessary.

Fuel cost is always important. This is considered in the design and capacity of the boiler, and in the design throughout.

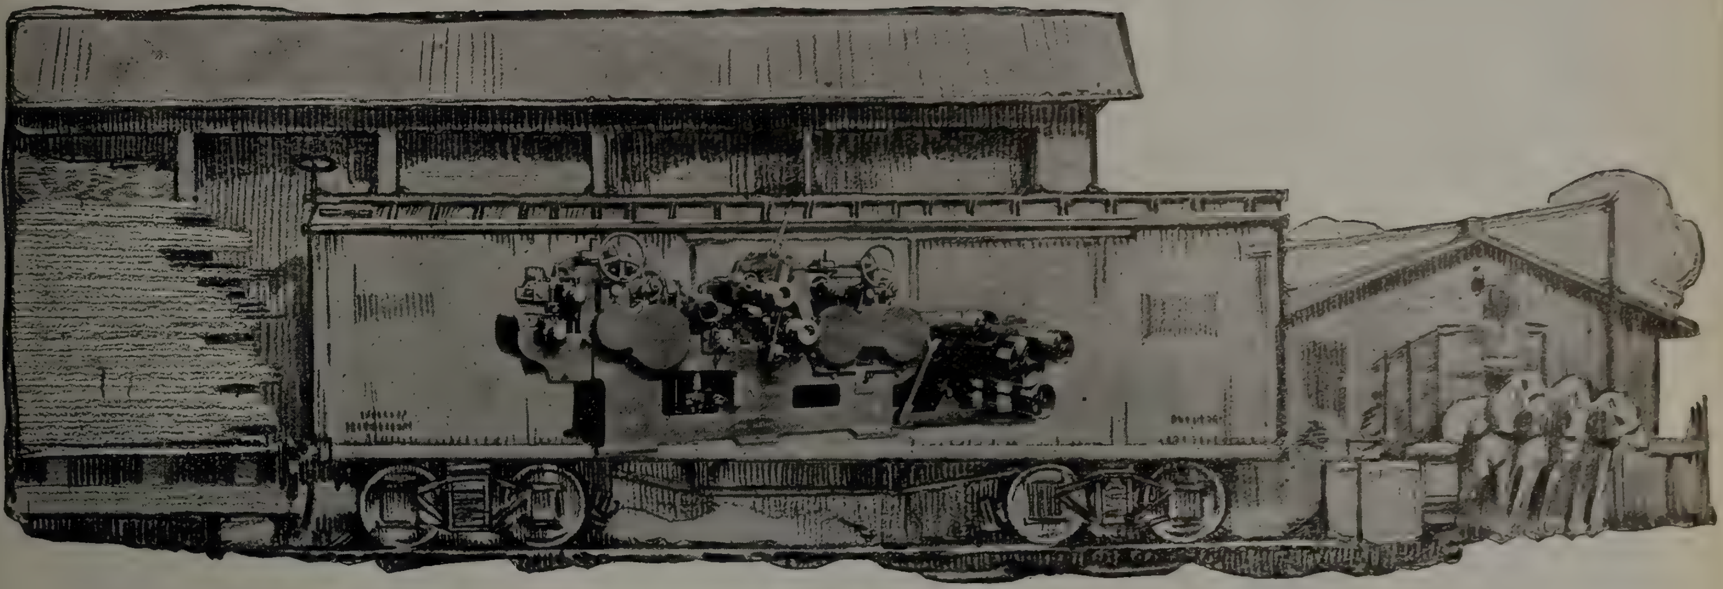
Write us concerning your requirements or ask for a consultation with our engineers.

We are in position to meet every requirement in locomotives and to supply repair parts at short notice from our Works at Longue Pointe, Montreal, Canada.

MONTREAL LOCOMOTIVE WORKS, LIMITED

BANK OF OTTAWA BUILDING, MONTREAL, CANADA

Run the whole CARLOAD on ONE Machine—



If *you* keep shop records—notice how many machines you *now* use to run off a *variety carload* shipment.

Beyond question, the Berlin profiling machines are the greatest *profit makers* for the *planing* mill.

But you know it is an easy matter to slide along with the equipment you *now* have, even if you believe that the *profiling* machine *will* make you *money*.

But you cannot avoid the fact that the man who can manufacture his 2x12's, No. 110 Drop Siding, Grooved Roofing, Ship-Lap, at the same rate of feed, 150 to 200 feet per minute, *is getting more money for his lumber than you are.*

You are not making as much money as you could, nor securing as much per M profits as is possible by the *new method* of manufacture.

More profits

There is a way to find out how much you could make by installing a *new* Berlin matcher with profiling attachment.

The formula is this: Figure up the number of M feet you manufacture per year on your old style machines.

Figure up just how much of that *work could be done on one* machine that does *straight* and *variety* work at fast-feeds.

Multiply the number of M feet by 20c as a minimum, 50c as maximum, as the *decrease* in cost of production and *increase* in *grades saved.*

BERLIN
Fast-feed
Matchers
with profiling attachment

The result is — so much more per M profits. You cannot afford *not* to buy.

Quick deliveries

Here is a carload shipment sent by a mill to Mr. O. King, Spring Green, Wisconsin. *It was all run on one Berlin fast-feed matcher with profiling attachment.*

THE C. A. GOODYEAR LUMBER CO.
Name, O. King, Spring Green, Wis.
Order No. 9193 Car No. Date, 1-20, 1911

20 pi. 2x8—14 S. Com. 525.
20 " " —16 " " "
5000 ft. 6" 1st and 2nds Bass Siding 6-16.
5000 " 4" 1st and 2nds Bass Siding 6-16.
3000 " 4" 8' No. 1 and 2 Hem. D and M dry.
5000 " 4" 10' " " " " " "
4" 12' " " " " " "
4" 14' " " " " " "
4" 16' " " " " " "
5000 ft. 4" 10' " " " No. 110 Drop Siding.
12' " " " " " " "
14' " " " " " " "
16' " " " " " " "
4000 ft. 2x10— 8 No 2 Hemlock
" —10 Resawed.
" —12
" —14 SIS
" —16 All 16 ft. you can.
4000 ft. 2x10— 8
" —10 No. 2 Hemlock Resawed
" —12 and Ship-lapped.
" —14
" —16
Bundle 4" Hemlock.

Suppose you have a quick phone or wire call "Hurry up a carload of this and that." Would it be to *your* advantage to have a machine that was a "quick deliverer." A Berlin matcher could fill that bill.

We have some interesting figures on *Cost Reductions* in various mills by the installation of Berlin fast-feed matchers. Send for them — address the Matcher Department.

USE

Your Mill's Refuse

To Dry and Preserve Your Wood

"The HOWARD"
Vulcanizing Process

Positively the quickest and most economical system known for drying and Preserving Lumber, Railroad Ties, etc.

POINTS IN ITS FAVOR:

Improves quality of all lumber
Increases the crushing strength
Increases the transverse strength
Reduces the weight 30 per cent to 45 per cent
It materially prolongs the life of wood
Eliminates shrinking, swelling and warping
Emphasizes and beautifies natural grain of the wood
Makes fit for commercial use woods not otherwise merchantable
Does away with necessity of maintaining heavy stock of lumber in yards
By this process green lumber taken from the log can be used for building purposes in 2 or 3 days

---

We invite Lumbermen and Owners of Woodworking establishments to see a practical demonstration of the process at our plant in Toronto

Our descriptive booklet tells in a most interesting manner the advantages, etc., of "The Howard System." It's yours for the asking

SAMPLES

OF WORK DONE ON OUR

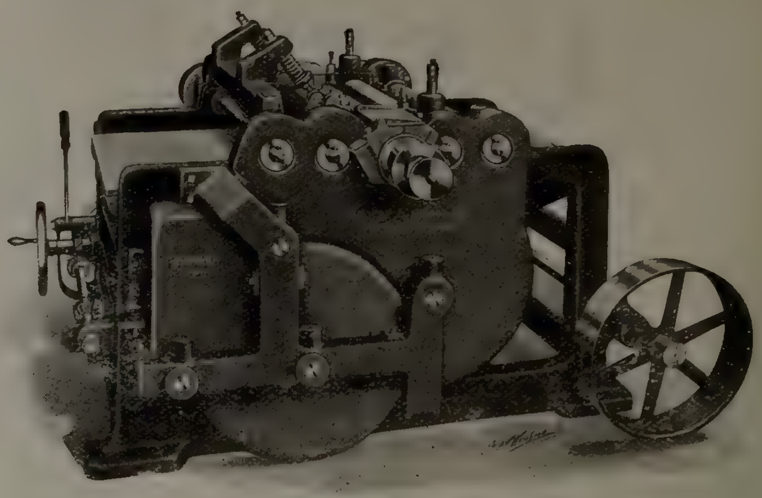
No. 156 Single Cylinder

AND

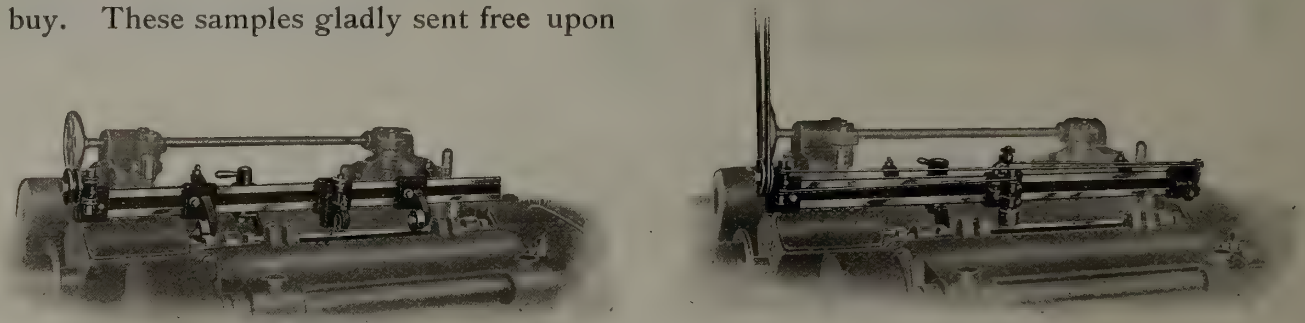
No. 200 Double Cylinder Cabinet Smoothing Planers

EQUIPPED WITH

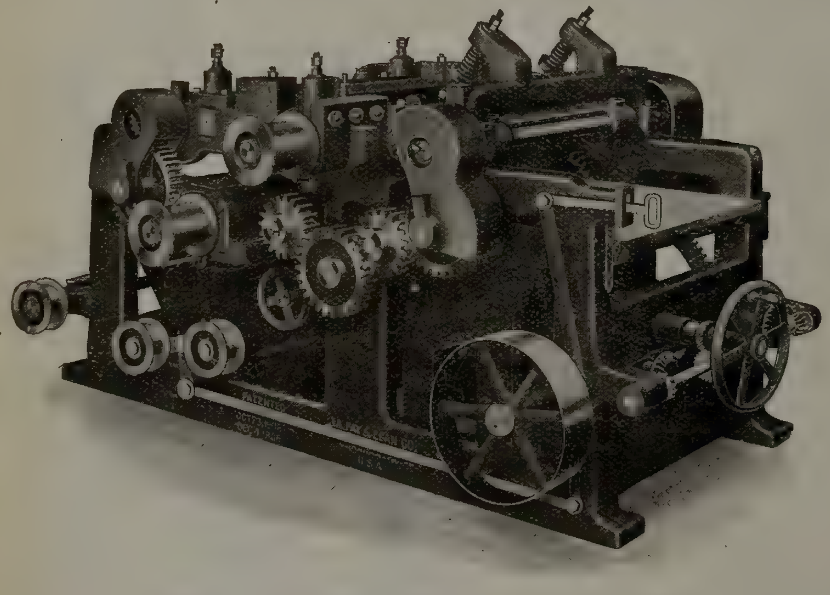
Air Hardened Steel Knives, Round Cutter-Heads, Automatic Grinding and Truing Attachment will convince you quicker than all the words we could use that we have the best single and double cylinder smoothing planers it is possible to buy. These samples gladly sent free upon request.



Patented—No 156 Cabinet Smoothing Planer



Showing Application of Automatic Grinding and Truing Attachment to our No. 156 Cabinet Smoothing Planer



Patented—No. 200 Double Cylinder Cabinet Smoothing Planer

For producing extra smooth surfaces to take a fine finish, as used in Furniture, Piano and Cabinet Factories, these machines are in a class by themselves.

The No. 200 is also a great machine for turning out fine box lumber finished on both sides.

You will be as enthusiastic about these machines as we are when you see the kind of work they turn out on fast feeds—impossible to find a knife-mark—looks like it was sanded—a post card to us will bring some of these samples and full description of these tools by return mail.

It will pay you to send
this card NOW.

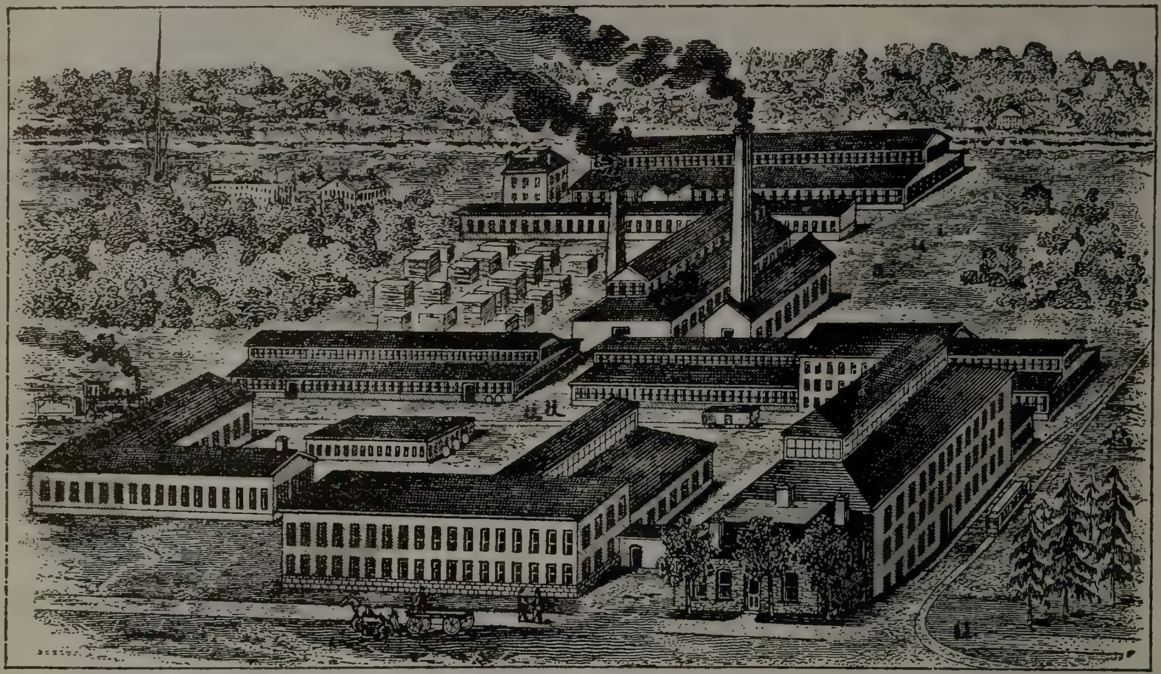
MAPLE LEAF SAWS

The Improved Racer Cross Cut Saw, by Actual Test, is the Fastest and Easiest Cutting Saw Made

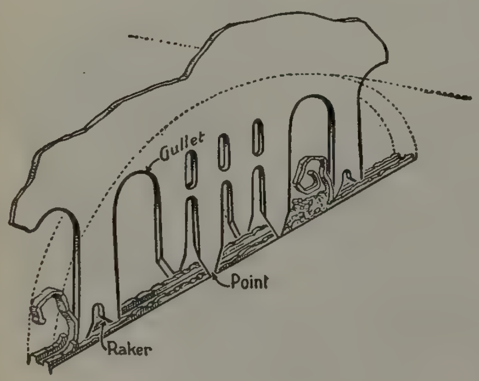


The Maple Leaf saw is higher priced than the ordinary saw because it costs more to make it. It is made of the very highest quality of steel and tempered by a secret process which toughens and refines the steel. The Maple Leaf trade mark on the saw means that it is the equal, if not superior to any saw made. It also means that you are privileged to test it against any other make and if not found equal or superior in quality you can return it and have your money refunded.

The ambition of the manufacturers of the Maple Leaf Saws has always been to produce the best tempered saw in the world and they are constantly investigating and experimenting with this end in view. They have recently made some valuable discoveries in evenness of temper. It has always been difficult to get a perfectly even temper on long and thin sheets of steel, such as saws are made of. Our recent discoveries make this an absolute certainty. Every user of saws should bear in mind that the temper of the saw is its most valuable quality. High finish and attractive appearance amount to nothing if the temper is not right.

All Maple Leaf Saws are Guaranteed to be Perfect in Temper

Shurly-Dietrich Co., Limited Galt, Ontario



Why Atkins Sterling Saws Run Free and Easy

Saws that depend on "set" for clearance have to tear their way through the timber, like the picture to the left. The teeth are sprawled out on either side and chatter and stick and bind and tear. That's why wood sawing is sometimes considered such hard work. That's why commonly ground saws can NOT run fast or pull easy.

ATKINS SEGMENT-GROUND CROSS-CUT SAW BLADES are ground thinnest on the center of the back. The teeth are the widest part, and the blade drops easily into the smooth cut which is made by the saw teeth. Very little set makes the teeth cut clean and the rakers clear the center. See the picture to the right. These Saws merely require enough power to pull them back and forth. That's why they run so easily.

ATKINS STERLING CROSS-CUT SAWS are the only Saws that are Segment-Ground, and for this reason are guaranteed to run easier and cut faster than any other Saws. Write us for free information, or order through your jobber or dealer. If they won't supply you, let us know.

The Enviable Reputation earned by

STILL'S AXE HANDLES

Has been built up chiefly by attention to two details:

1. Care in the selection and seasoning of the wood.
2. Skill in the shaping and balancing of the handle.

As a genuine satisfaction-giving line, Still's Handles have no superior and very few equals. The prices will interest you.

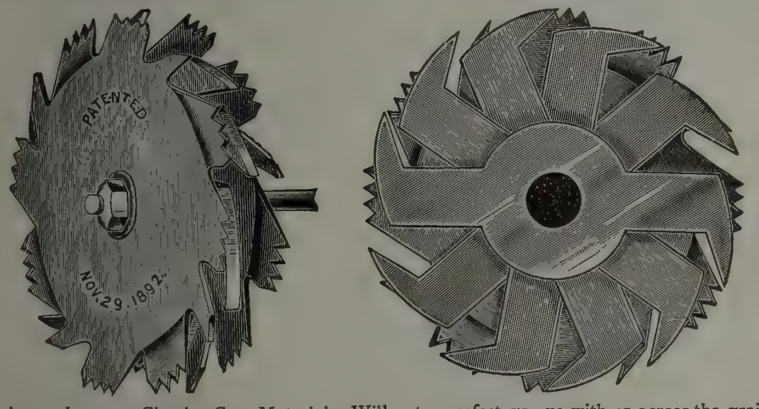
HUTHER BROS. PATENT GROOVER OR DADO HEAD
For cutting any width groove from one quarter inch to 2 inches or over



Can be used on any Circular Saw Material. Will cut a perfect groove with or across the grain. This is the only Dado Head on the market that gives entire satisfaction on all classes of work. No screw adjustment. For different width grooves, simply remove or add inside cutters. Sold by builders and dealers of wood working machinery in all parts of the United States. Will send on approval, in competition with any other make on the market; if not the best return at our expense.

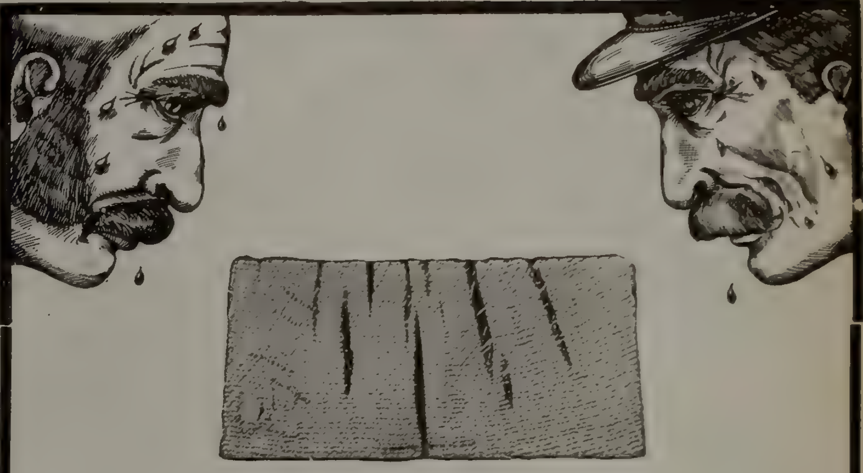
Shipments in Straight or Mixed Carloads.

Address **Cranbrook, B.C.**



If you attempt to dry two-inch oak in in your kiln, in fourteen days, the result will probably resemble the above illustration.

The lower picture is from a photograph of two inch oak dried by the Grand Rapids Veneer Works Process in fourteen days, and every plank as sound as the sample.

The absence of checks is not the only saving due to this process. The lumber is straight, soft and free from sap or acids.

For a small sum of money your old kilns can be converted to G. R. V. W. Process Kilns, with a guarantee to give the results above described. For particulars, address Henry Pringle, Agent, Belleville, Ont.

Waterous New Champion Edgers

From the Operator's Point of View

The man who is ***using*** a machine is the best and severest critic of its worth.

That's why we are building our Edgers to do the work not only in the quickest, cleanest and most accurate way, but are embodying features in its construction that make it easy to operate, simple to adjust, convenient for cleaning, and perfectly safe.

Sounds like a pretty big handfull but its true. First take a good, close look at the cut we show and then listen to this :——

The frame of the New Champion is built in box form open at the top to let in lots of light. The front rolls though very heavy are divided, and give the operator a clear view of the saws when cutting. He can watch his cant right through the machine.

The saws are shifted by our improved double shaft supported swing back guides. These are fitted with hemp rope plugs, the best non-heating plugs made to-day. Straight line levers are used in shifting. To ensure absolute accuracy in spacing the saws, a drop gate, operated by foot tread from the front of the machine, drops down over the guide and automatically crowds it into correct position and *holds it there.*

The planed cast iron board guide is also operated from the front of the table and by lever and quadrant can be adjusted to set the board being edged any distance up to four inches from the inside stationary saw.

To change the saws, all that is necessary is to remove the bridgetree supporting the third bearing, turn back the swing guides —(stationary as well as movable guides are made this way)—and slip off the saws. The bearings placed on each side of the driving pulley that support it against side strains when operating, will hold it perfectly in line while this is being done.

The Edger will take a 6″ cant. Some operators have had their own experiences trying to put through stock that the manufacturers' catalogues say their machine will handle. But we mean this We put a 22″ saw on the mandrel; this carries a 6″ collar, giving a good 7″ cutting edge. And another thing we supply a mandrel 3⅞″ in diameter that will take the strain of the maximum cut and never spring a particle. This seems pretty nearly likely when you consider its size in comparison to that supplied on most other machines of this capacity, and to this add the fact that it is supported in three boxes having a bearing length each of almost ten inches.

Then, to make the operation absolutely safe, *four* feed rolls, chain connected and driven from the saw mandrel, are supplied. These are fluted to give a firm secure grip on the timber but will absolutely not mar the same in any way. Press rolls, divided to permit two sides of the Edger to handle different sized stock at the same time, are very heavy, swing away from the operator to feed more readily and thus secure a more permanent safety grip on the cant.

We supply the boxes with caps that are fitted with large oil reservoirs, and consequently require little attention. Every box is adjustable and readily gotten at.

There is a whole lot more that we would like to tell you about these Edgers that we cannot get into the space at our disposal. Our bulletin, though, gives it all in the clearest possible manner. LET US SEND IT TO YOU—FREE.

Log Handling Machinery

The cut shows the type of cylinder we have been putting on all our kickers, loaders and canters for over four years. In that time it has been thoroughly tested in many mills and its value has been thoroughly proven.

Notice that all piping between valve and cylinder has been done away with.

Notice also the check valves in head and base of cylinder. These valves cause the steam to cushion in the cylinder at each end of the stroke, thus preventing the piston or the top or bottom head being broken.

The
Grand Triumph
Shingle Machine

is probably the best known horizontal shingle machine made in Canada.

We are the original manufacturers of this machine in Canada and the only manufacturers in this country making the genuine Grand Triumph machine.

It will cut upwards of thirty thousand shingles in ten hours, and it requires for its greatest capacity only ten horse power to run it.

It cuts all of the bolt into shingles—no waste at the end. Send for our catalogue.

440 Square Miles Timber Limits

on Georgian Bay

to be Sold by Private Sale in Large or Small Blocks.

On account of their President and Principal shareholders being engaged in other large enterprises, and not having the time to give to them all, THE PARRY SOUND LUMBER COMPANY, Limited, offer for Sale all of the timber lands, mills and town property situated in the Town of Parry Sound; also Tug Scow and full Camp Equipment for five camps, including boom chains, snow plows, sleighs, etc.

THE LIMITS TO BE SOLD

comprise some 440 square miles of licensed and deeded Pine, Hemlock, Spruce, Birch and other timber. The licenses from the Ontario Government include all timbers and are not restricted for time. Government dues are as follows: Saw Logs, White Pine, $1.50 per M. ft., B.M. Saw Logs, Hemlock, Tamarac and other woods 75c. per M. ft. The timber is situated in the Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street. The Canadian Pacific, Canadian Northern and Grand Trunk Railways run through the limits, which makes some of the parcels offered for sale particularly desirable for small mill owners.

POSITIVE

PULLEYS

What's Your TROUBLE?

Do you have trouble from the operation of any of the pulleys in your mill? We have found that nearly every mill has one or more troublesome pulleys, and we are looking for just this kind of "tough transmission propositions." Sometimes the difficulty is from one cause and sometimes from another. In the instance below, we overcame two troubles. Read what this gentleman says about how we made good.

November 18, 1910.

The Positive Clutch & Pulley Works,
Limited, Toronto, Ont.

Gentlemen:—

We have one of your pulleys, 40 x 10, transmitting 60 h.p. as our main drive since last July. We have never had to tighten same since first installed, and are pleased with the noticeable absence of windage from the arms. The above conditions have always been our principal objections in connection with wood pulleys. We formerly had a wood pulley on this particular drive and were obliged to shut down every other day to tighten it on the shaft. We finally had to key the pulley to the shaft and the key soon split the hub. We believe that you have a very superior pulley and we wish your company every success.

Yours very truly,

(Name furnished on request).

Let's analyze and see why the "Positive" Split Pulley is successful. The pressed steel arms, while giving maximum strength, are very small. Thus, the wind resistance, or windage, is the very lowest. Did you ever push a bicycle against a head wind? Takes muscle, doesn't it? Each pulley with wide arms wastes from $10.00 to $20.00 of your horse-power per year. Again, the "Positive" malleable hub with its interchangeable cast iron bushings grips the shaft like a vise. You can tighten it as tight as you like; the hub won't split, and it stays tight. "Positive" Pulleys make good where others fail; they cure transmission troubles. It's likely we've cured a case similar to yours. What's your case?

Canada, United States and Great Britain, $2.00 per year in advance; other foreign countries embraced in the General Postal Union, $3.00.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Vol. 31 Toronto, June 15, 1911 No. 12

Canadian Trade Increasing Rapidly

An examination of the comparative tables which have just been issued by the Department of Trade and Commerce for the fiscal year ending March 31, 1911, showing details of the trade of Canada for the year as compared with the year previous shows that Canada has taken a long stride forward in her progress as a commercial nation. The total of imports for consumption and exports was $759,000,000, greater by $82,000,000—over 12 per cent, or one-eighth—than that of the previous year, which was also a record maker in point of trade. To this total may be added $10,000,000 of imports which were not entered for consumption, making the grand aggregate of Canadian trade for the year $769,000,000—about $76,000,000 increase over the previous record. Imports for consumption show an increase of $86,000,000—almost 23 per cent. Of this increase about two-thirds was dutiable goods, and the customs duties collected were greater by $12,000,000—20 per cent. or one-fifth—than in the previous year.

Compared with the year 1909-10 total, exports show a decrease of about $4,000,000, but compared with the greatest year total previous to 1909-10 the increase is over $17,000.000. The decrease is due to a drop of $8,000,000 in agricultural products and to slightly lower totals in the animal and forest classes. To counterbalance this there is an increase of almost $4,000,000 in the amount of manufactured goods exported while the mine gave an increase of $2,700,000.

In the principal articles of trade increases occurred in the imports for consumption including $22,000,000 in iron and steel, $6,000,000 in wood, nearly $5,000,000 in cottons, $3,000,000 in coal, $2,500,000 in sugars, $2,400,000 in bread-stuffs, $2,000,000 each in oils and drugs, dyes and chemicals, $1,800,000 in fruits, $1,600,000 in woollens and $1,000,000 each in electric apparatus, gutta percha, leather, paper and silk. Decreases were few and very small. These figures are eloquent of Canada's expansion, while an increase of $4,000,000 or 40 per cent. in the value of effects brought in by new settlers tells its own story of the class and extent of immigration.

The principle articles exported show decreases of $7,000,000 in wheat, $3,000,000 in apples, and $1,000,000 each in cattle, coal, fish, hides, cheese and wood. While these changes must be due in a large measure to smaller crops, owing to unfavorable weather conditions, the enormous increase in home consumption is an important factor in reducing the quantity of goods available for export. The articles of export showing increases include silver $2,000,000, iron and steel $1,800,000, bacon and hams $1,700,000, cordage $1,000,000, hay and seeds each $900,000, paper $800,000, salted codfish and furs each $700,000, leather $600,000, wood pulp and nickel each $500,000. Many of these are articles which require in the production a large expenditure of labor and th increased exportation of such goods is indicative of Canada's growing importance as a manufacturing country. A decrease of about $4,000,000 in the exports of foreign goods is balanced by an increase in the exports of coin and bullion.

A decrease in total exports does not necessarily show lessened demand for Canadian goods abroad, but rather a decrease in the amount of goods available for export. On the other hand, an increase in the export of manufactured goods indicates the growing popularity of Canadian products in other countries.

It must be borne in mind that foreign trade is subject to fluctuations which it is impossible to control and difficult to explain. From these variations Canada suffers probably less than any other commercial country in the world, and the steady and rapid increase of her business in the world market and the infrequency and small importance of the periodical reactions are outstanding features which prove the stability of her commerce and guarantee her advancement in the years to come.

Exports of forest products for the year were valued at $45,439,057. During the three previous fiscal years the values were as follows:—1910, $45,517,033; 1909, $39,667,387; 1908, $44,170,470. For the fiscal year ending March 31, 1911, the exports of forest products were only exceeded in value by those of agricultural products, $82,601,284, and animal produce, $52,244,174.

Exports of wood and manufactures of wood for the fiscal year were valued at $52,005,241 as compared with $53,522,142 for the previous fiscal year. Of this total the exports to the United States were valued at $33,931,854, and those to the United Kingdom at $12,883,567. The imports of wood and manufactures of wood for the fiscal year were valued at $17,237,372 against $11,462,522 for the previous fiscal year. Of this total $16,486,140 came from the United States and $353,999 from the United Kingdom.

Securing and Keeping Customers

Securing a customer for a wholesale or retail lumber business, and keeping him, are quite different propositions. Securing a customer may often be the result of chance. Many a customer happens into a particular company's yard for no other reason than that it is the most convenient one to his own place of business. Once he has placed his first order, however, everything else depends upon the way in which he is handled and the manner in which he is supplied with the goods he needs. Only the most courteous kind of treatment and the most careful attention possible to the requirements of a customer can in the long run retain him on the company's books. After all, the only object of a company should be to afford just this class of service to customers, yet the opposite is too often the case and a customer is looked upon too much as a possible source of profit for the one deal only.

The writer recently saw the conclusion of a transaction which, small enough apparently and rather opposed to the principles under which a good deal of modern business is transacted, will surely turn out to the benefit of the dealer concerned. The firm is a new one in the district, but there is ample trade to warrant its existence as well as the existence of another firm in the same town. A new customer arrived one day with an order for material to be used in connection with some mining operations about 10 miles from town. The order was taken and the lumber was shipped. A few days later when the writer happened to be in the office, the customer dropped in with a complaint that the lumber upon arrival was short of the amount ordered by 14 pieces of 2 x 4. There were several possible explanations for this in the mind of the customer. The dealer might have been careless or dishonest or the lumber might have been stolen in transit. If the dealer was particular about his good name there could be only one way of making a good impression upon this new customer, i.e., to stand the loss himself and disabuse the customer of any idea that he had tried to get the better of him. Without any hesitation he took the customer into the yard, allowed him to choose 14 new pieces of 2 x 4 and saw them loaded upon his wagon. The customer had been caused the trouble of coming to town especially to get the missing lumber, but it is safe to say that he formed such a good impression of the honesty of the dealer and he will in future give him all his trade.

Of course there is another feature of the case which the dealer must bear in mind, after the customer has left. Customers may be be dishonest and the loss should be traced carefully. If claims for shortages, etc., are made several times by the same customer, the matter should be looked into more carefully than ever. This class of customer however will generally hang himself in a short time if he gets enough rope. It should not take a new firm many months to find out who the dead heads in ths district are and to let them take their trade to someone else. Upon his arrival however, there is nothing for him to do but watch his deliveries as closely as possible and to give the benefit of the doubt to any customer who has a complaint which cannot be disputed immediately.

This rule applies more of course to the dealer in a town than to the large wholesaler in the city. A large firm with travellers on the road continually, has facilities for following up a complaint and finding out the cause of trouble which a small town dealer cannot afford. The dealer who is referred to above was formerly in the wholesale business in Chicago. Complaints of this nature were frequent and it happened often that the cause of trouble was traced to its origin and further losses of a similar nature were avoided. He himself however was quick to appreciate the different conditions under which he was working in a new place. "It is different here," he said. We must just be generous and watch out. Perhaps we are being robbed sometimes, but if so we will soon find out the character of the customer. Possibly, however, he is thoroughly honest and a good prospective customer. The odds are strong in our favor and we run a fine chance of making a firm friend and a good customer."

North Shore Manufacturers Turning to Ontario Markets

The lumber manufacturers on the east and north shores of Georgian Bay have in most cases made their contracts for the season's cut, and in regard to the north shore trade in particular it is reported that the prices which have been secured are less, by from $1 to $2 per thousand feet, than they were a year ago. A representative of the Canada Lumberman who recently visited most of the mills in that district found in every case in which this falling off in price was reported the reason given was the falling off in the demand from the United States markets. The north shore of the Georgian Bay is so situated that in practically every case the natural market for its lumber is in the United States. Large schooners and barges can take on cargoes at the mill yards and delive them at Chicago, Bay City, Saginaw, Detroit, Buffalo and other large United States cities at a favorable freight rate, which enables them to find a good market in spite of the duty of $1.25 per thousand feet upon lumber going into that country. Not only are the United States market easily reached, but in order to reach the market of a large part of Ontario a long and expensive rail haul was involved.

Under such conditions, these manufacturers have been affected adversely by the unsettled industrial conditions which have prevailed in the United States during the last few years and which have been rendered infinitely more acute by the political unrest of the last few months and its natural outcome; the proposed tariff alterations. Until these conditions are remedied and some assurance is received that political conditions will not be allowed to disturb business conditions so continuously as in the past, it is natural to expect that the United States demand for lumber will not revive to its normal proportions. A natural outcome of these conditions is that manufacturers of lumber who formerly depended almost entirely upon the United States, should turn their attention to the Canadian markets and see whether there is not a fair chance of securing in Canada, sufficient trade to at least make up for the falling off on the other side. This is being done to-day by several of the largest manufacturers on the north shore of Georgian Bay. One prominent manufacturer, to-day has an experienced traveller visiting many of the consuming points of older Ontario to look into the situation and find out whether it will pay to work up this trade. Others are considering the advisability of going in for a planing mill business. This would mean the erection of a planing mill and the investment of a lot of new capital. It is, however, the natural development for a large saw mill which can obtain a favorable rail rate to its markets. Much depends upon this feature of the case and efforts are being made to-day by some of the companies to obtain rates from the railways which will enable them to go in for this branch of the business. If the railways can see their way to meeting the lumber manufacturers in this regard it will be a matter of the greatest importance to the saw milling industry, and will make it possible for the manufacturers to assist to that extent in the promotion of the movement for the conservation of our timber resources, by encouraging the more economical and more complete working up of the timber into marketable products.

So far as south western Ontario is concerned, it is possible to-day by means of a lake and rail haul by way of Sarnia, for the manufacturers of the Georgian Bay to ship their lumber into the consuming centres and compete successfully for trade. This has been done by a few companies for many years and there seems little doubt that the depression in the United States trade, if continued, will increase this line of trade materially. Whatever the outcome of the situation may be it is significant and to a certain extent encouraging to note that conditions are forcing the manufacturers to pay more attention to the Ontario markets. With two distinct sets of markets to depend upon, these manufacturers will be all the more independent of industrial disturbances in either country.

Labor Shortage Becoming Acute in Ontario

The labor situation among the saw mills of northern Ontario at the present time is far from satisfactory, from the employer's point of view. Many of the mills are unable to find enough good men to handle their cut properly. There are a few exceptions to this, but in general the complaint is heard all over the north country, that although wages are unusually high good men are scarce. In any mill which one may visit he will find laborers of many nationalities. Prominent among them are French Canadians and Indians. The former work fairly steadily in the mills and the latter work spasmodically in the yards and at loading the vessels. The Indians are the most unsatisfactory class of laborer that the lumber manufacturers have to deal with. They will work for a time and then take a rest while spending the money they have earned. There is no telling how long an Indian will stay on the job. When he feels like stopping he stops, caring little for any inconvenience which may result. In addition to the French Canadians and the Indians there is a large proportion of foreign laborers in the mills. These include Poles, Sweeds, Russians, Finns and Syrians. The Syrians are the worst class of laborers that the employers have to deal with. They would much rather make a living out of peddling than out of working at a fixed employment. Their natural inclination is to wander and to peddle. They cannot be depended upon to stay for any length of time at mill or yard employment. As peddlers they are a serious drawback to the country. They carry a pack of cheap clothing and jewelry and when pay day comes around at the mills or camps they arrive in droves and get a good deal of the men's wages from them in return for their shoddy wares. In some cases also they carry secretly a few bottles of bad liquor and dispose of it among the ememployees at mills where the sale of liquor is forbidden. Sawmill owners invariably do their best to prevent this but they find it a troublesome problem.

The old days when good employees who took a keen pride in their work could be secured in sufficient number have probably gone forever so far as the lumber industry is concerned. Canada is so prosperous to-day and there is so much construction work in progress that the laborer has become independent and restless. It may be claimed that this is all the better for the laborer and that the employer should not complain if he has to pay higher wages. The employer would not complain if he could get the same old class of dependable labor. This is not the case however. He is paying higher wages and he cannot get men who will turn out the quantity or the class of lumber that was turned out in former days when labor was plentiful and wages were lower.

Nor is the laborer who secures higher wages to-day better off than was the man of some years ago who received less. Indeed, it is scarcely to be doubted that he and his family are less comfortable than formerly. When wages were smaller the men were not so restless and were content to keep steadily at work. To-day they move from one position to another. What they gain in the way of increased wages is frequently lost by unemployment between jobs. Moreover, it is generally agreed that the expenses of living amply make up for the increase in wages, so that even if they were permanently at work it the one situation their position would only be on a par with that of the days when wages were lower.

These conditions are more or less prevalent in all parts of Canada to-day and so far as the lumber manufacturer is concerned there appears to be little prospect of relief. The employment agencies which devote particular attention to supplying laborers for the woods and the mills have not been of much assistance. They can supply the men but they cannot make them stay at work. So restless has the laborer become that after his transportation has been paid to a mill he frequently stays long enough only to look about the place and then lights out for some other employment. In not a few cases he finds his way back again to the employment agent and the latter is well content to make another commission from some employer by sending him out again to another job. Some of the agencies with a more honorable underseanding of their duty try to discourage this sort of thing, but the foreigner is not a man to care much about the ethics of such a matter.

The lumber manufacturer or woods operator has only one way in which to overcome these troubles. The welfare and comfort of the men in their employ must be looked after with as keen an eye as any other profit-producing factor of the business. In most of the mills and camps this is recognized to a considerable extent, but there is room for improvement still. The writer has in mind a mill which he recently visited where he found a good class laborers, many of whom had been with the company for several years. They did not pay higher wages than any of the other mills in the same district, but they had the reputation of setting the best table in that part of the country. This probably had much to do with their success in keeping their employees. In the matter of living-quarters for the men there is also great room for improvement still, ventilation, sleeping accommodation, and medical attention are still sadly neglected in many cases. The labor factor has come to be so important to-day that these matters will have to be attented to more carefully than in the past, and it looks as though only along these lines can the lumber manufacturer or woods operator look for any appreciable measure of improvement in the future.

Editorial Short Lengths for Busy Readers

A regulation has been issued by the Dominion Government providing that licensees of all timber berths shall prevent unnecessary destruction of timber and exercise constant supervision to prevent the occurrence and spread of fire.

The Quebec Legislature has passed a bill setting aside $18,000 for the protection of forest. This is a new departure on the part of the province and the government has intimated that other grants will shortly follow as it has been determined to do everything possible to conserve the forest wealth of the province. A system of co-operation with timber owners and railway companies will be inaugurated.

A Seattle, Wash., report says that an effort to restore the lumber industry of the entire Pacific Northwest to a normal condition and enable millmen to obtain what they consider a price which will represent fair profits instead of losses, lumber manufacturers are about to launch a curtailment movement on a scale never before attempted on the Pacific coast. Manufacturers expect to curtail the output enough to restore prices to their former levels.

The plan which has been worked out at a series of meetings held during the past three weeks, contemplates the suspension of operations in the plants catering to the retail trade, every Saturday. The cargo shipping mills will curtail four days per month, although the exigencies of shipping regulations may often prevent them from closing on Saturdays.

The movement to curtail the manufacture of lumber is backed by manufacturers in both Oregon and Washington. Millmen in both states have been active in the plan to put an end to over production. Over production, manufacturers maintain, is responsible for the present low prices prevailing on northwest lumber.

Notices appealing to every resident of British Columbia to carry out their share in protecting the resources of the province from destruction by fire, have been issued by the provincial department of lands. The notices point out the immense revenue that the lumbering business brings to the province, and also points out the reward offered by the government for information that will lead to the conviction of delinquents in this respect. Acting under instructions from Hon. W. R. Ross, minister of lands, the department has greatly increased its force of fire wardens in every part of the province for the protection of forests and other property from destruction by fire. In many districts which have previously not had fire wardens, new appointments have been made, and now the entire province is practically covered by an efficient staff.

The province has been divided into seven divisions, each division being under the control of a divisional fire warden. The divisions are subdivided into districts numbering in all 107, each district being under a district warden. The department has issued instructions to every member of the staff on the best methods to be used in fighting and preventing fires. The supervision of the general details of the work has been placed under the control of three commissioners, with headquarters in Vancouver. The department has also provided four launches to patrol the coast line from Vancouver north to the head of Vancouver Island, with special orders to watch pleasure-seekers and campers who may carelessly light fires and leave without properly extinguishing them.

Opportunities for Export Lumber Trade

Information Furnished by Trade Commissioners in Wood Importing Countries — Importance of Bristol Channel Ports — Decreased Exports to Trinidad

Canadian Woods at Bristol Ports

When it is understood that about 25 per cent. of all the forest products imported into Great Britain are brought into the country for distribution through Bristol channel ports, the opportunities they afford for increased supplies from Canada will be worthy of consideration on the part of exporters, and the following details concerning the various ports of discharge are submitted for their information, says the Canadian Department of Trade and Commerce in its weekly reports. The timber business is in the hands of experienced firms who thoroughly understand the requirements of their respective districts, some of whom no doubt will be well pleased to increase their Canadian imports whenever prices permit doing so to advantage. The class of timber produced in Canada has to meet the competition of that sent to this country from Northern European countries, including Russia, Sweden and Norway, which have the advantage of shorter transport and cheap labor. The city docks provide excellent accommodation for the handling of timber cargoes, and at Portishead dock a new wharf 600 feet long and stacking ground of about 10 acres in extent have been provided. It is equipped with railway sidings and several quick working cranes for the special handling of wood goods.

Imports of wood goods during 1910 were as follows:—

Wood, hewn—Pit props	loads	287
Unenumerated	"	3,807
Sawn—Deals, boards, battens, scantlings ends	"	146,503
Staves	"	11,994
Furniture	tons	751
Dye	"	1,466
Jarrah	loads	1,239
Laths	"	870
Lathwood	"	821
Firewood	"	194
Other descriptions	"	4,027
Total		172.059

Cardiff Facilities

Owing to its proximity to the great South Wales coal fields, Cardiff holds an important place in the timber trade of the United Kingdom. It stands second only to London, with a total import in 1909 of 1,089,032 loads, London being first with a total of 1,589,360 loads. The Bute docks are the only docks situated in the city of Cardiff, and have an area of 163 acres. The Bute docks are equipped with the most improved appliances for the discharging and loading of cessels with despatch, the greater portion being worked by electric and hydraulic pressure. There is an ample equipment of cranes of various power up to 70 tons. Large provision is made for stacking timber, deals, iron ore, etc. Timber ponds 28 acres in extent, with competitive railway communication to all parts.

The following shows the imports of wood goods into Cardiff for the year ending 31st December, 1910:—

Wood—		
Hewn—Fir	loads	5,876
Oak	"	9,172
Pit props	"	923,017
Unenumerated	"	81
Sawn—Fir	"	151,166
Unenumerated	"	384
Other descriptions	"	904
		1,089,654

Totals for 1908 and 1909—		1908	1909
Timber and deals	loads	139,329	169,025
Pitwood and mining timber	tons	458,092	304,726

Imports at the Penarth dock—

	1909	1908
Sleepers	1,787	1,772
Wood pulp	23,652	33,471
Pit wood		15,592
Timber sundries	1,490	1,623

Coal Mine Supplies from Swansea

Swansea is an important port in connection with the South Wales colliery districts, and consequently very favorably situated in connection with the importation of pitwood and other timbers required for use in the coal mines. Owing to the higher cost of freight it is understood that pitwood could not be profitably exported from Canada under present conditions. The new King's dock was opened a year or two ago. Constructed at a cost of nearly £3,000,000 has an area of 66 acres, and is fitted with the most modern machinery and appliances for the rapid loading and discharging of the largest steamers. The following are the imports of Canadian sawn woods into Swansea for the year ending 31st December, 1910:—

Canada—	Loads
Spruce and birch deals	8,896
Birch planking	1,937
Deals	7,196
Birch and spruce	2,320

Gloucester, as the most inland port in the Bristol Channel, has facilities for the distribution of wood goods into Birmingham, South Staffordshire, East Worcestershire and other Midland districts, either by rail or canal, direct from the ship's side, or from the wharfs of the Sharpness new dock, and the Gloucester and Birmingham Navigation Company, equal to any other port in the district. Additional space has been provided in the yards of the Gloucester and Sharpness docks for the storage of cargoes of deals and mining and other timber, and they are fully equipped with railway sidings. There is a timber pond of 6 acres at Gloucester and one of 12 acres at Sharpness.

Imports of Timber into Gloucester since 1906 were as follows:—

	1906 loads	1907 loads	1908 loads	1909 loads	1910 loads
Fir timber (balk) American	9,070	11,297	7,474	14,656	13,730
" " European	4,222	5,748	5.733	7,564	7,193

	217,637	172,879	180,862	204,072	213,291

Particulars Regarding Sizes and Grades

Timber or lumber is imported into Bristol Channel ports both sawn and planed, the latter coming from Sweden and Norway at present in large quantities. Sawn and hewn pitch pine logs come from Pensacola and Mobile, size of sawn from 9 in. and up to about 16 in. in 20 ft. and up; hewn logs of larger dimensions; birch logs from Quebec about 8 to 15 ft. long from 16 ins. and up. Spruce deals from Quebec are from 3 x 24 down to 3 x 7, 6 to 16 ft. in length.

As regards the market for logs, birch logs are occasionally imported from Quebec, the other logs coming principally from South America and the Baltic. With regard to the market for telegraph, etc., poles and posts, the rate of freight from Canada prohibits any possibility of competing with the Baltic ports.

Transport facilities are provided by canal or Great Western Railway and Midland Railway to all important places in the country. Vessels can discharge at Avonmouth or at Bristol city docks. The usual custom for settlements in the timber trade is c.i.f. Bristol cash, less 2 per cent. in exchange for documents or four month draft net. These terms are occasionally varied by mutual consent between the shipper and consignee where the parties are well known. The term 'load,' as referred to in this report, consists of 50 cubic feet.

Canadian Lumber in Newfoundland

The Department of Trade and Commerce in its weekly reports gives the following information regarding the trade of Newfoundland in forest products:—

Nature of Products

Canadian forest products principally used in Newfoundland are as follows:

Spruce dimension timber, 10 x 10 to 12 x 12, is used only when local timber is not in sufficient supply and especially when the sizes required are in excess of what the local market can supply. The quantity imported during the fiscal year ending June 30th, 1910, was valued at $13,364 as against $15,737 in 1909, and $25,817 in 1908.

The same is true of spruce joisting, 2 inch and 3 inch thick, 9 inch to 12 inch wide, 18 to 25 feet long.

Canadian grey birch is used for shipbuilding and mill-wright purposes. From 100,000 to 200,000 feet of this is required annually, as the local birch is not satisfactory for these purposes. A trade in birch and maple flooring, dressed and matched, is springing up, as local forests supply nothing suitable. Not many hardwood floors are yet in use, but the use of maple and birch flooring is increasing.

This colony is said to have been a large buyer of Canadian lumber twenty years ago, but the trade has been dwindling ever since then, as local enterprise has produced from local forests most of the supplies for building trade in recent years. For the past ten years not much Canadian lumber has been imported. The forest products mentioned above cover about all the imports which have taken place in recent years. Nothing except the best grades is imported. The local market supplies all requirements in lower grades. There does not appear at present to be much opening for Canadian products, such as logs, telegraph and telephone joles, etc. All such posts, poles, railway ties, &c., are easily obtained from local forests. The colony is a large exporter of ground and sulphite pulp. At St. Johns the depth of water is ample for the largest steamers. Cargo is hauled at piers usually on contract by competent stevedores. A moderate rate of charge is made, that on lumber being 50 cents per thousand feet.

A Competitor for Canadian White Pine

Within the last year or two, a white pine, similar to the Canadian white pine, has been discovered in Siberia, and shipments increasing in volume have been made to the United Kingdom. Most of the good judges of white pine in the United Kingdom have inspected or tried the wood, and have almost invariably pronounced it as similar to Canadian white pine. As there are large virgin forests in Siberia of this wood, it is bound to have a serious effect on the demand in these markets for white pine. The continuous increasing rise in price of Canadian pine has the effect of irritating buyers here, and they are only too pleased to look for a cheaper substitute. With the high freights, there is very little danger of competition in the lower grades of white pine, especially as there is such a large demand in Siberia, Manchuria, Japan and China for lumber, but in the better grades there is likely to be keen competition for the Scotch trade. A steamer cargo of 3,000,000 feet of first and second quality of Siberian pine was recently discharged in Glasgow and London, and other cargoes are expected before the end of this year. These cargoes are bound to have a serious effect on the demand in Scotland for Canadian good pine deals and sidings.—Trades and Commerce Report.

Canadian Lumber Trade with Trinidad Decreasing

Imports of lumber into Trinidad from Canada have declined of late years. According to the reports of the Canadian department of Trade and Commerce the total quantity of lumber imported for several years past has approximated in value to £50,000 annually. The bulk of this was in pitch pine supplied from the Southern States of America. For Canadian soft woods the demand appears to be falling off, as the importation has decreased. The average is about £8,000 a year. Last year the demand for lumber rose considerably causing the importation to rise to £81,903, principally in pitchpine. Pine and spruce from Canada was £5,753 in value, and below the five years' average. Here again it may be doubted whether this figure can be relied on, as the soft woods are generally spoken of in Trinidad as being Canadian, though imported through U. S. ports. The importation of shooks, staves and puncheons for some reason has also declined, being last year £4,695, whereas the averages for the four years previous was £6,800. Canada gets a small amount of this trade annually. The quantity of shingles imported has been almost negligible for several years past, the average for five years being about £50 in value. The use of galvanized iron, slates and tiles is entirely replacing the use of wooden shingles. Details of imports for 1910 are as follows:—

Lumber, dressed and undressed—	
United States	£71,365
Canada	5,753
Others	785
	£77,903
Wood hoops, duty 10 per cent. ad val.—	
United States	£ 48
Shooks, staves and puncheons—	
United States	£ 4,604
Canada	84
Others	7
	£ 4,695

The Canadian Department of Trade and Commerce in its weekly report gives some interesting facts regarding trade in wood goods at Birmingham, England. Referring to spruce, the report says:—A size which is largely used but can be obtained only with the greatest difficulty from Canada, is the 2½-inch stuff in 11-foot lengths. Canadian shippers insist upon sending 3-inch instead of 2½-inch. A large quantity of this is used (coming from Riga) for 'shifting boards,' which are temporary bulkheads on board ship. The complaint is made that Canadians are indifferent to this valuable business. It is also said that Canadian shippers of spruce, especially in the maritime provinces, are conservative, and reluctant to cut special sizes and lengths when required. In this way much business is lost, as buyers naturally go elsewhere to get what they want.

Commissioner Grigg's Trade Report

The British trade commissioner at Montreal, Mr. Richard Grigg, in his annual report upon the trade of Canada gives exhaustive particulars regarding the import trade of the country in all its leading branches. The report is unusually interesting and thorough and will be of much service. In connection with the imports of wood and manufactures of wood, the report shows that the trade has fluctuated since 1905. The details of imports are as follows:—

Dutiable	$2,660,781	$2,160,353	$ 3,210,525	$2,497,207	$ 3,264,230
Free	6,015,589	5,822,969	10,031,548	6,282,035	8,104,483
Total	8,645,370	7,983,322	13,242,073	8,779,242	11,468,713
U.K. dutiable	107,244	99,520	174,907	149,157	213,741
U.K. free	31,292	14,584	44,699	27,014	38,915
U.K. total	138,536	114,104	219,606	176,171	252,656
U.S. dutiable	2,322,802	1,904,973	2,805,592	2,159,111	2,907,537
U.S. free	5,939,059	5,744,823	9,930,208	6,147,249	8,008,975
U.S. total	8,261,861	7,649,796	12,735,800	8,306,360	10,916,532

Spruce Shooks for Textile Trade

In connection with the great trade done from the Leeds and Hull district in the export of woollen and other textile goods, a considerable quantity of spruce shook boards are used each year for making packing cases to hold cloth during shipment to foreign markets, says the weekly Trade and Commerce Report. These boards are at present obtained from the Baltic and the United States. It is estimated that the imports from the latter country alone amount to 20,000 each year. Canadian exporters should be able to enter more freely into the competition for this trade, especially as the experience of local firms has proved that there is no better wood than Quebec spruce for this purpose. The boards used are tongued and grooved and measure in length from 5 to 10 feet, the widths varying from 5 inches upwards. In the supply of these boards the use of wood affected by weaknesses such as knots or black marks is strongly discouraged, as exporters in the textile trade attach considerable importance to the strength of the packing cases which usually have to stand a great deal of rough usage in transit.

Personal and Trade News of Interest

Keenan Bros., Limited, manufacturers, Owen Sound, Ont., report a very good trade in progress and excellent prospects for the rest of the present season.

The Georgian Bay Lumber Company, of Waubaushene, Ont., have cut all the timber on their limits Nos. 61 and 62 on the Blind river, and will close up their Blind River office in August.

The Saginaw Lumber & Salt Company, whose mills are located at Thessalon, Ont., have recently changed the name of their firm and it will in future be known as the North Channel Lumber Company.

Mr. Walter Baer, formerly of the Export Lumber and Shingle Company, Vancouver, B. C., has severed his connection with that company to take charge of the business of the Mainland Lumber and Shingle Company, of Vancouver.

The Union Lumber Company of Toronto, which was organized a month or two ago, report that they have experienced already an encouraging demand for their lumber. They have recently purchased about 1,000,000 feet of white pine, of last year's cut, from A. T. Mackie, of North Bay, and have also secured stocks from Wm. Milne & Son, Trout Lake, and the Cavendish Company, Callendar.

Galbraith, Bumstead & Arthur is the name of a new company which has recently erected an excellent planing mill at Owen Sound. They have been running now for about two months and have suffisient local business to keep the plant working to capacity. They turn out sash and doors and all kinds of planing mill products. They intend in the near future to extend their business and go in for the rail trade.

The Owen Sound Lumber Company, Owen Sound, Ont., have recently added a new director to their company in the person of Mr. J. M. Kilbourn, of the Canadian Cement Company. They have also increased their capital from $50,000 to $200,000. They report that their business in hardwood is growing rapidly and that the outlook for trade is excellent. They expect to handle about 20,000,000 feet of hardwood this year.

The M. Brennen and Sons Manufacturing Company, Limited, Hamilton, Ont., have issued an illustrated catalogue of their greenhouse construction material and hot bed sash, which will be very useful to retailers at this season of the year. The company use white cork pine exclusively in the manufacture of these materials and they are therefore less affected by atmospheric conditions than other classes of greenhouse construction material.

Herman H. Hettler & Company, of Chicago, whose Canadian lumber was sawed last year at Victoria Harbor, will move their office from that place to Midland, Ont., next month, and will have their logs sawed at Manley Chew's mill. They still have between 15,000,000 and 20,000,000 feet of timber standing on the Dokis reserve which will provide two or three season's cut. It is expected that the company will, in the meanwhile, secure other timber properties in Ontario, so as to continue their Canadian operations. Last winter the company cut between 8,000,000 and 9,000,000 feet at their three camps.

Will Soon Be Well Known in Canada

James H. Walsh, of Duhlmeier Bros., Buffalo, N. Y.

We are pleased to publish herewith portrait of Mr. James H. Walsh, of Buffalo, N. Y., eastern representative of Duhlmeier Brothers, the well known manufacturers of hardwood lumber, whose main office and yards are at Cincinati, Ohio. Mr. Walsh will not only look after the entire eastern field for this company, but will cover the Canadian territory as well. Mr. Walsh is a splendid lumberman and is well known among the trade. He has had full experience at the mills and is in close touch with the producing points. With his well known ability as a lumber salesman and with the excellent goods which his company handles, it is safe to predict for him a successful and increasing business. Duhlmeier Brothers' mills are located in Kentucky, Tennessee, and Missippi. They always carry in stock between three million and four million feet of hardwoods at their mill points and at their main distributing yard in Cincinnati. Mr. Walsh's office is in the White Building, Buffalo.

Trade Active at Sudbury

The Evans Company, Limited, Sudbury, Ont., report a very active trade in progress for this time of year. In addition to handling lumber of many varieties this firm have branched out into the general building supply trade. Each member of the firm is a practical builder, having been brought up in some special branch of the building business. They find that by handling other lines of building material in addition to lumber, they are able to secure a great deal of general trade which would otherwise be scattered, and which, with their special facilities, they can handle with the greatest economy. An idea of the extent of the business carried on by this firm may be obtained from the fact that they handle among other the following important lines; sash and doors, mill work, frames, mouldings, and interior finish, rough and dressed lumber, shingles, lath, brick, lime, hair, cement, and cement products, roofing, fencing, sand and gravel, fire bricks, and plaster.

The Empire Coal & Lumber Company, the members of which are largely the same as those of the Evans Company, Limited, handle rough and dressed lumbers, hard and soft coals, stove wood, cement, lime, roofing, and builders' supplies generally. Another company, the members of which are also largely the same as those of the Evans Company, Limited, is the Sudbury Brick Company. This company has recently erected a splendid brick making plant with the most modern type of kilns, and is turning out a large supply of good building bricks for which there is an excellent demand. The material is secured from an extensive clay deposit located adjacent to the plant and upon which sufficient clay has already been found to keep the company in material for at least fifty years to come.

The example of the Evans Company, Limited, in widening the scope of their business interests is one which could be followed to much adavantage by many retail lumber firms.

An Active Towing Season on Georgian Bay

Captain E. F. Burke, of the Midland Towing and Wrecking Company, who makes his headquarters at Little Current, Ont., reports that the company have about 125,000,000 feet of logs under contract to tow for the present year. The Midland Towing & Wrecking Company take contracts for delivering the logs belonging to a large number of the lumber companies on the Georgian Bay and Lake Huron. The president of the company is Mr. James Playfair, of Midland. The average boom towed by the company under present-day conditions contains about 3,000,000 feet of logs. In the earlier days, when logs were exported from Canada to United States mills, booms containing as much as 7,000,000 feet were of frequent occurrence. The Midland Towing & Wrecking Company have been in existence for fifteen years or more and have delivered logs to widely different points, all the way from Garden River to Midland. In the palmy days of the Bay City trade as much as 300,000,000 feet of logs would be delivered at that port in one year.

Railway Will Benefit Lumbermen

The lumber industry of Manitoulin Island and the north shore of Georgian Bay stand to benefit considerably by the approaching completion of the Manitoulin and North Shore Railway, which will run from Sudbury to Little Current. The company expect to have their right-of-way all cleaned and burned from Espanola to Little Current within a very short time. Construction gangs are working upon the line in several sections. Trains are running over it now from Sudbury to Crane Hill, a distance of about 22 miles. To the people of Manitoulin Island this railway will mean a great deal, as it will give them communication with the mainland throughout the year and provide them with easy access to the excellent markets of Sudbury and other northern towns. The length of the railway will be about 54 miles in all and it is expected that it will be completed for operation about a year from the coming fall. To the lumber industry on Manitoulin Island this will provide connection with Sudbury which will enable them to develop a car lot trade. Under present conditions their trade is practically all of a cargo nature, most of their lumber going to United States markets.

New Sudbury Company Making Progress

The Casey, Shaw Lumber Company, of Sudbury, Ont., who have recently entered the lumber field as manufacturers, wholesalers and retailers of lumber, report that their business is developing in a very encouraging manner. The company have a mill at Long Lake, about five or six miles south of Sudbury, where they cut timber secured from the township of Broder. There are from 3,000,000 to 4,000,000 feet of excellent white pine still standing on this township. The mill cuts about 20,000 feet a day. The company expect that the township of Broder will be cleaned off next year.

Mr. E. L. Casey, one of the members of the firm, was for many years secretary of the Herman H. Hettler Lumber Company, of Chicago, and has a wide acquaintance among the lumber trade. Mr. Charles R. Shaw, the other member of the company, was formerly Canadian manager for the Hettler Lumber Company, a position which he occupied for a number of years.

Mr. F. C. Crawford, the former owner of the Sudbury planing mill, was for a short time with the Casey, Shaw Lumber Company, acting as superintendent, and also as mill manager. He retired recently from the company.

Premier McBride was interviewed recently by officials of the United Brotherhood of America on behalf of the Loggers' Union of British Columbia, and as a result of the conference held and statements made by the labor representatives it is likely that the management of timber camps on the coast will be closely investigated in the near future. Briefly, the charges formulated were to the effect that the law is being constantly violated in three important respects, viz., the employment in timber camps on leasehold and licensehold lands of Chinese and other Orientals, that engineers other than those properly certificated are being employed in numerous camps and that some few camps in the northerly coast district are importing and employing men in direct contravention of the Alien Contract Labor laws, notwithstanding the fact that natives of the province are seeking employment. Premier McBride promised to give the matter his immediate attention, at the same time declaring his determination to enforce obedience to the law in every respect.

National Lumber Manufacturers' Meet

Ninth Annual Gathering Held at Chicago—Canadian Reciprocity Roundly Condemned —Lumber Advertising Strongly Advocated—Panama Canal Trade Discussed

The ninth annual meeting of the National Lumber Manufacturers' Association was held in Chicago on May 24 and 25, and was the most successful in the history of the association. Mr. R. A. Long, Kansas City, Mo., in replying to an address of welcome from the Mayor of Chicago, took advantage of the opportunity to express the confidence of the association in its retiring president, Mr. Edward Hines, and to criticize strongly the opponents of Mr. Hines, who have recently done so much to defame his character in connection with the celebrated Lorimer election fund. Mr. Long expressed his conviction that when the evidence had all been presented, Mr. Hines would come out with flying colors and that it would be shown that he had worked harder and more effectively for the good of the lumber industry of the United States than any other man who had ever occupied the position of president.

President Hines, in reply to Mr. Long, referred forcibly to the charges which had been made against him and expressed his own intention not to rest until they had all been refuted beyond any question of doubt.

A resolution introduced by the board of governors expressing confidence in Mr. Hines was then passed.

President Hines' Address

In his annual address, Mr. Hines referred first of all to the question of Canadian reciprocity, expressing the conviction that a great injustice was proposed to the lumber industry and urging upon all members of the association to do the utmost in their power to convince the government at Washington that the lumber industry would be seriously injured by the passage of the proposed reciprocity agreement.

Referring to the business situation Mr. Hines said:—

The Business Situation

"A year ago at our meeting indications pointed to improved business conditions, and the prophecy made at that time has to some extent been fulfilled. The volume of trade has considerably increased. There have been some advances in the price of low grade lumber, but by no means is lumber to-day selling at what it should be, consistent with the price of stumpage, the cost of production, transportation, the overhead expense and carrying charges of interest, taxes and risk of fires and cyclones.

"Viewing the situation from the immediate present the crop reports never were better, and, while the prices are somewhat lower, if the present indications of volume materialize, it should approach at least that of last year. The future never looked better from an agricultural standpoint.

"But one strong feature that may affect the farmer, cause him to hesitate and delay contemplated and necessary improvements, which particularly would affect lumber, is the uncertainty of the reciprocity bill passing, and if it should pass, immediately placing on the free list all of the farmers' products, in my judgment it would have a tendency to influence the farmers of the middle west, extreme west and northwest to wait and allow conditions to settle in order to determine how much they would be affected by such changed conditions. This, in my opinion, would stop at least for the time their making such improvements and purchasing such articles as under ordinary circumstances they would reasonably expect to purchase this fall. In my judgment this will not alone affect the purchase of lumber to some extent, but everything else as well, except immediate and absolute necessities.

"Also, this must have some effect upon farmland values in the middle west, extreme west and northwest, as it is bound to have the tendency to divert investments to the Canadian northwest, where cheap land is available, also diverting more or less of the funds that would ordinarily be retained in our own country.

"This particular situation is at the present time peculiarly and directly retarding the development of a section of the country where, prior to the reciprocity bill being presented, there was considerable favorable consideration being given toward the settling of the cheap lands, cutover lands and drained lands, and which had not shared up to this time with the more favored sections of the west and middle west, viz., the south. This is especially deplorable to the southern lumber manufacturers as naturally they would have been enabled to market a greater portion of their product in nearby markets.

"The financial situation is apparently sound, money being plentiful, not alone at all large centres, but throughout the country, and at comparatively very low rates.

"The transportation companies have stopped everything but absolutely necessary improvements and the purchasing of additional equipment. This directly affects the lumbermen. There is one exception to this, and that appears in the box industry. A marked improvement during the last six months has been evidenced, and a considerably larger portion of this class of lumber has been utilized and cut up by the box industry, which makes the low grade material in reasonably active demand."

A number of interesting addresses were delivered by officers of the various lumber associations represented at the meeting. These addresses contained a valuable outline of the business conditions and problems of the present day.

The first item of business after the opening of the second day of the meeting as an address by J. A. Bloedel, Bellingham, Washington, upon the subject of the Panama Canal and its effect upon west coast commerce. In the course of his address Mr. Bloedel referred to the advantages which Canadian shipping possessed. His remarks upon this subject were as follows:

Canadian Shipping Advantages

"But now comes the danger of competition from our neighbors to the north, British Columbia. They are not hampered by our shipping laws, and can ship in any vessel flying any flag in the world. Even the United States government is, at this writing, employing a fleet of nine foreign vessels carrying coal from the Atlantic for its Pacific coast naval supply. These vessels could carry in return 33,000,000 feet of lumber. Now, if they go through the canal on the same basis as our American shipping, they can make rates as low as $6 a thousand, inclusive of canal tolls. My attention has been called to several charters made last fall, one of which was from the British Columbia side, at $2 less than another, which was from the American side. You naturally ask why, and I answer that an American built vessel carrying 3,500,000 feet of lumber can be duplicated on the Clyde for one-half the money. Our American seamen are paid double and treble the wages of foreign seamen and our coasting requirements are much more exacting. That is why our foreign brother can save $2 a thousand feet in shipping to the Atlantic seaboard.

"It appears from present indications that the reciprocity bill, now before Congress, will become a law, putting rough lumber on the free list, and if there is no provision on behalf of American shipping overcoming this differential all advantages to us, arising from the construction of the canal, are for naught."

Mr. Robert Fullerton, Des Moines, Iowa, delivered an excellent address upon "Popular Ignorance of the Lumber Industry," in the course of which he argued forcibly in opposition to the conclusions recently published in the government's official report of the lumber industry, prepared by Commissioner Knox Smith. In the course of his remarks he said:

Misleading Report

"If it is wise and desirable for the government to reserve and tie up timber lands for future needs, why should our commissioner of corporations criticise and condemn private owners of timber for doing the same thing? Is it a crime, a violation of the Sherman anti-trust law, for lumbermen to hold property in growing timber in the hope that it may enhance in value sufficiently to pay interest and taxes, and a possible profit? Every word and line of Commissioner Smith's report shows a deliberate purpose to create suspicion in the public mind that a lumber trust is in process of formation, if not at present in working order. A more ingeniously prejudiced and misleading official report never was issued. As evidence of Commissioner Smith's ignorance of the requirements of the lumber industry, I quote the following sentence from his report: 'The 1,802 largest holders of timber now own 88,579,000 acres of land, as compared with a vastly wider distribution of public lands in non-timbered agricultural sections.' Practical lumbermen will smile at this official comment, but newspaper editors and magazine writers who read these landlord-looking official figures will see concentration and combination and threatened monopoly of the country's forest resources, and write black lettered headlines about the lumber trust and urge the department of justice to get busy and indict our 48,000 sawmill and timber owners for conspiracy and combination in restraint of trade among the several states and foreign countries. No sane mind could believe in the possibility of 48,000 independent sawmills and timber owners operating in every state and territory from Florida to Alaska (including the active competition of Canada), forming a trust or combination in restraint of trade or for any other purpose under the sun."

At the Thursday afternoon session an interesting symposium of addresses was delivered upon the subject of "Advertising—Lumber versus its Substitutes." Mr. W. A. Gilchrist, who introduced the discussion, gave some interesting statistics showing the extent of advertising used by the various substitutes for lumber. He concluded his remarks with the following words:—

"Can a single instance be cited where an exploitation of the use of wood has been conducted to call the public's attention to its suitabilities? Those that have been promoted are merely to advocate a species of wood. Further discussion will probably enlighten you on this subject.

Laggardness in Lumber Publicity

"My proposal is to exploit all the woods as a suitable material for a variety of purposes, and it matters not in so far as the industry is concerned what species is used by John Jones and his wife, who are about to build their new home—whether it be fir, spruce, pine, hemlock, hardwoods or what not. The results generally are the same. But assume what state of mind John Jones and wife are in on examining a publication treating upon house building, purchased at the nearest news stand, to assist them in arriving at some definite conclusion, so as to convey their ideas to their architect, of finding a variety of advertisements exploiting woods, suitable for structural materials, all laying claims to their material being the strongest, toughest and most desirable. I presume the architect would settle this dispute by recommending the use of a substitute material.

"This association is representative of a production of 25,000,000,000 feet of lumber. Who would begrudge an expenditure of 1 cent a thousand on their cut?

"What a fund it would create, handled in a suitable manner. Lumbermen, stop being fatalists; help yourselves, and accept this as one of the methods to combat our difficulties."

Mr. A. T. Gerrans, of the Southern Cyprus Manufacturers' Association, who also spoke upon this subject, said in conclusion:

"We surely must grant the necessity of trying to regain some of our lost ground, and I have endeavored to show you in a small degree that some of the material we rather look upon as indestructible is not so; also that there are two sides to the question of building too permanently; and in conclusion I beg to state that the Southern Cypress Manufacturers' Association at its last meeting, after a presentation of the subject of an advertising campaign to be carried on by the National Manufacturers' Association, unanimously adopted the resolution favoring the project and voted 1 cent a thousand feet on their output, provided the other associations joined in the movement. We feel that movement can be made, and will be made a great success, and provide what we are all looking forward to—a greater demand than supply."

Mr. Geo. E. W. Luehrmann spoke of the experience of some of the members of the association in advertising red gum. His concluding remarks were:

"Personally, I believe the lumbermen have overlooked a crying need not to have advertised their goods at an early date. I certainly feel that an organization or club should be formed at once and receive the support of every timber owner and manufacturer in the United States. A committee should at once appointed and men should be selected who have had experience in this line of work. As for the little experience that I have had I can safely say that a great deal of money can be wasted in printer's ink by inexperienced men. Others may become too enthusiastic and spend it in too large a quantity, so that I suggest we select a committee of conservative men who can give the matter attention. While we gum producers have no official organization, I think I can state on their behalf that we are in on any advertising proposition on the same basis as other woods. It is easy to waste money in ordinary and commonplace advertising."

Mr. Charles E. Brower referred to advertising wooden packages, saying in part:

"When we look about us and see the advertising of the large corporations there is a lesson for us in the form of their advertising. Did you ever hear of a beef corporation advertising beefsteaks? They advertise their by-products, as beef extracts, soaps and the like. Have you ever heard of the Standard Oil Company advertising kerosene? They advertise vaseline and other by-products. Why not consider low grade lumber as our by-product? Why not establish a bureau of research within ourselves and not depend upon the national government and learn to utilize our by-products? It does not seem to me that God intended us to throw away the tops of the trees. I think we lack education. We should establish a bureau of research, as others have done. Look at what the German chemists have accomplished. They have developed a long line of coal tar products, such as vapo-cresolene, which is nothing but a refuse of coal tar that some chemist has worked out for them. The Standard Oil Company employs expert chemists to do nothing else but work with by-products. The lumber industry should wake up. I am not sufficiently well informed to give specific instances of utility, but even sawdust might be made profitable if we learned how. As Professor Schenck has said, it is the unearned dividends that make a profit. It is not what we are plugging at to-day; it is what we will develop that will make profits for us. It is our present waste that should be a dividend payer instead of a dead asset. Every lumberman knows that tree tops in the woods encourage fires. If we could develop some use for them it would not only be an added profit but remove a present source of danger. It must resolve itself into a matter of education and of utilization of waste for the benefit of mankind and for our own profit as well. We ought to get together on the subject that is now being discussed. We should be doing some serious study along these lines and not depend upon others to do it for us."

Resolutions Adopted

The committee on resolutions reported the following, among other resolutions which were adopted:

"Resolved, That the National Lumber Manufacturers' Association reaffirms its position heretofore taken, and opposes any further reduction in the tariff on lumber and other forest products being schedule D of the present tariff bill; and recognizing that the agricultural interests (which are the foundation of our prosperity) of the United States are in jeopardy, under the proposed reciprocity pact with Canada, we oppose the adoption of said arrangement, and earnestly urge all members of the association to do all in their power to prevent the adoption of the measure, to make said arrangements effective"

"Whereas, The early completion of the Panama canal will create a new condition in the marketing of lumber and other products between the Pacific and Atlantic seaports; and that

"Whereas, Under our present coasting laws, our merchant marine is not able to compete with the foreign marine engaged between the Pacific and the Atlantic coast; therefore be it

"Resolved, That the National Lumber Manufacturers' Association earnestly urge the support of Congress, in the support of the passage of remedial legislation."

Mr. Everett G. Griggs, Tacoma, Washington, was elected president of the association for the ensuing year.

Meeting of Lumber Trades Congress

The third annual delegate convention of the American Lumber Trade's Congress was held at St. Louis, Mo., on May 22 ond 23. The result of the meeting was the completion of a code of ethics which, it is believed, will provide an ideal instrument for regulating the business relationships of members of the trade. Officers for the ensuing year were elected as follows: President, Geo. E. Merrill, Salt Lake City, Utah; first vice-president, F. S. Underhill, Philadelphia, Pa.; second vice-president, Carroll F. Sweet, Grand Rapids, Mich.; third vice-president, Henry S. Stein, Seattle, Washington. Among the alterations which were made to the code of ethics the following were most important:

Section 14 amended to read as follows:

"Except when inspection is provided for by association inspection bureaus, claims on grades, also differences regarding contracts, should be settled by arbitration on request of the parties interested.

"Whenever a case for arbitration arises, one referee should be appointed by the retailers' association in whose territory the claimant resides, and a second referee should be appointed by the manufacturers' or the wholesalers' association covering the district in which the shipment originated. Said referees, as appointed, should appoint a third referee, and all referees should be appointed with due consideration to convenience and expense. The expense of such arbitration should be paid pro rata, as the fault may appear.

"Arbitration methods should be employed wherever possible in the settlement of all matters in dispute.

"A written statement of the findings in each case should be made by the referees, and their findings should be final, and copies should be sent to the secretaries of each of the organizations through which the referees were appointed."

Section 15 to read as follows:

"In the matter of cost of inspection made by association inspection bureaus on lumber, the grade or measurement of which has been complained of, if reinspection or remeasurement shows the grade of the total amount of the item complained of to be within five per cent. of the grade invoiced or within one per cent. of the amount invoiced, the expense should be borne by complainant; if otherwise, by the shipper. The shipper must credit buyer with the amount of degrade found by inspection, irrespective of percent. determined between the grade sold and the grade shipped, at an equitable price. No claim on grade or measurement should be considered valid unless made by final consignee within five days after unloading the car."

Section 16 and 17 struck out and in their place the following substitute adopted:

"It should be recognized by lumber manufacturers and wholesalers that the retail distributor of lumber is a necessary factor in the trade and a useful servant of the public, and as such be recognized as the logical channel through whom to market their products."

The Waste Land Policy of Ontario

Suggestive Problem Regarding Possibility of Profit from Extensive Tree Planting—Review of Results in Prussia

In the examinations on forest finance lately held at the University of Toronto Dr. Fernow, dean of the Faculty of Forestry, formulated the following practical problem as one of the examination questions:—

"The province of Quebec decides upon a policy of buying up and reforesting wasts lands to the extent of 12,500 acres. The land can be purchased at $5 per acre. Four per cent. is needed for roads, fire lines, etc., and $5,000 are spent in the first three years for surveys and in these improvements. The planting is done at $10 per acre and annually 1,000 acres are planted to pine. The salary list is $3,000 per annum. As each plantation becomes 35 years old a thinning can be made and produces at the rate of 50 cents per acre, this income each year increasing at the rate of 1.5 per cent. When 60 years old the final cut can be made and produces $300 per acre. The province can borrow at 3 per cent. How large must be the loan, when will it be repaid with interest by the harvests. What is the value of the forest after repayment of the loan?"

The problem proved somewhat too complicated for the majority of the students, but the solution is rather interesting and illuminating as showing what the policy, on which the province in a small way has entered, might become if carried on in a broad-guaged manner.

To carry out the proposition, a loan of somewhat less than $500,000 would be required; the loan would be paid back with interest in the 62nd year, and the remaining forest will then be worth over $2,600,000. In reality a much larger value can be confidently expected due to rise of wood prices.

In this connection the following statement of the waste land policy in Prussia, printed in Dr. Fernow's Forestry Quarterly for June will prove of interest.

After describing the deplorable condition of the waste lands in the Polish provinces, made useless through mismanagement of farm and forest, resembling very much the conditions in Norfolk county, the efforts to recover these lands are recited.

Private efforts in the sixties to reforest waste lands remained without result. The forest protection law of 1875 also failed to be effective, as well as the law of 1881 which was to encourage the joint management of small farm woodlots. The provincial information bureau, in existence since 1903 and 1904 have done some good work, but not adequate to the need. Several reforestation associations were formed, comprising ownership of some 7,000 acres, who are assisted with plant material,, etc. But really adequate, permanent results could only be expected from government activity.

In the sixties and seventies small amounts were set out in the forestry budget for the entire monarchy for purchase of waste lands. These amounts varied in the sixties from $35,000 to $95,000; in the seventies were increased to $250,000 annually; and from 1882 to 1892, the annual budget for this purpose was increased to $500,000 in the average, and since 1900, also all the receipts from sales of public domains, were set aside to secure waste land and forest properties; in addition exchanges were made.

From 1887 on, attention was given specially to the reforesting schemes in the province of West Prussia, where the need was greatest. Since the holdings in that province were mostly small and scattered much difficulty was experienced in amalgamating large enough properties. Some 120,000 acres, however, of these small lots were bought in the first decade at prices ranging from $4 to $12 per acre, about $10 in the average. Some larger properties with well preserved forest were also acquired.

Although by 1900, some 170,000 acres had been purchased, all but 25,000 acres of which were absolute forest soil.

After 1900, when the debts of the Napoleonic wars had been paid up, and thus the income from disposal of public lands became available, purchases of waste land progressed more rapidly. But even this did not satisfy the situation, and in 1902 the vote of $25,000,000 for colonization purposes in these Polish provinces was designed also to increase the state forest property.

This measure, to be sure, had a political as well as economic aspect, namely, to co-operate with the colonization commission in the germanization of the provinces.

This fund of 25 million was nearly exhausted by 1908, and was replenished by a further $6,000,000. By 1910, from these two funds about 140,000 acres for forest purposes, had been purchased, at an average cost of $42.60, while from the annual general forest purchase fund and by exchanges also additions were made, so that the entire transaction totals a forest territory acquired since 1900 of 258,000 acres, of which 218,000 acres are pure forest land, and 64 per cent. of this under woods, leaving some 70,000 acres of waste lands to be planted in these provinces alone. The whole purchase money spent in this policy in these provinces alone was $7,000,000 or about $27 per acre. In addition about $400,000 were spent in making working plans for these new areas, which also increased the forest ranges by 116. Lately, owing to rise of prices and other reasons the activity in this waste land policy has somewhat slackened.

To reforest these waste lands annual appropriations of about $500,000 are made.

To prevent fires from spreading, fire lanes of 250-300 feet width separate the plantations, and every known precaution against loss by fire is employed.

The profitableness of the undertaking is only touched on and, of course, is left uncertain as the movement of wood prices is uncertain. A table, however, shown the remarkable rise in wood prices durin the last half century. In the state forests of the four countries involved the yield for wood per acre has been as follows:—

	1850		1892		1907	
	cents	per cent.	cents	per cent.	cents	per cent.
Danzig	20	100	127.6	651	300.3	1534
Marienwerder	23.6	100	176.4	747	398.1	1686
Posen	52.8	100	181.1	346	333.1	631
Bromberg	29.5	100	177.5	602	310	1052

These figures look hopeful for financial success. It is also shown that the consumption of log material has grown ahead of the population; the import during 1866-71, averaging 80 million cubit feet, had risen in 1897-1901 to around 320 million cubic feet, and in 1908, a year of economic stagnation, to 450 million feet.

In this connection, the rapid change of prices for lands is of interest as exhibited by the average prices paid for farms by the colonization commission, namely, in 1886-1896, $55-65 per acre; 1904, $98 per acre; 1906, $137 per acre; 1909, $122 per acre.

A special example to a change of hands of a forest property which closely resembles experiences in this country. Around 7,000 acres, the property of the prince of the Saxe-Meiningen, was sold in 1898 to a bank for $300,000, because the forest supervisor considered it improper to make an extraordinary felling in order to secure $12,000. The bank immediately cut this amount from 275 acres and in 1899 sold the property for $500,000. In 1904, upon the death of the new owner the colonization commission bought it for $800,000.

The lumbermen of the Ottawa Valley, to a man, are enthusiastic over the reciprocity contract between Canada and the United States, according to Mr. Alex. Maclaren, of Buckingham, Quebec, one of the owners of the North Pacific Lumber Company's plant at Barnet, B. C. "Lumbermen in the East," said Mr. Maclaren, when interviewed at the Hotel Vancouver, "are anxious that the agreement be ratified. They realize that the result of the proposal cannot but benefit them. Under the present arrangement, the United States has free access to the timber markets in Canada, a privilege not mutual, and hence there has been more lumber coming over the border to the Northwest until recently than we Canadians were shipping to the Americans. There is also a great deal of lumber entering Ontario and Quebec from the United States. This material is mostly southern timber. With the ratification of the reciprocal arangement, the markets of the United States will be free to the Canadian lumbermen—an unquestionable advantage. "There is no danger of our pulp areas being ravaged by the Americans. With the tariff even as it now stands there is a great call for the product by the paper consumers of the republic. There is no reason why any tariff damper should be placed upon the exportation of the manufactured article. The Fielding-Taft arrangement will benefit us, and hence will benefit the Canadian people directly."

British Capitalists Favor B. C.

A. D. McRae, the well-known financier, accompanied by Mrs. McRae, returned to Vancouver on April 30th from a three months' visit to England and the continent. While in the old land Mr. McRae gave his attention to a number of important matters calculated to advance the prosperity of this province and the west generally. The flotation of a $3,000,000 debenture issue of the Columbia River Lumber Company, Limited, of Golden, B. C., which has been absorbed by the Canadian Western Lumber Company, Limited, was one of several large deals carried to a successful conclusion by Mr. McRae during his stay among the money kings. He is of opinion that Canadian investments were never regarded more favorably in England than at the present time, believing that British Columbia propositions came first, with issues from other Western provinces next in regard, and that the resources of this province are probably better known and appreciated in Great Britain than those of any of the older provinces.

Mr. McRae is an ardent champion of reciprocity. He said: "Without going into many details let me say that the proposed arrangement will immensely benefit the lumber industry, and likewise the products of the mine, forest and farm. Eastern manufacturers are kicking, but I can't see how they can possibly be injured

Life of the Shantyman in the Bush

A Close Range View of Important Factors in Lumberjack's Affairs —The Liquor Problem—"Nature's Gentlemen" Well Represented

By Horace A. Bell

The shantyman, though he plays such an important part in Canadian commerce, is but little understood by the general public, and, indeed, is oftentimes grossly misrepresented. He is by no means always the uncouth, uncivilized, dissipated individual he is depicted as being, but has many traits in his character which are worthy of commendation.

When, on account of a breakdown in health, I was advised to sever for a time my connection with daily journalism and seek recuperation amidst the scent of the pines, I secured a position as clerk in one of the shanties of a large lumber firm in the Nipissing district, and whilst serving in that capacity I was brought into intimate association with the men of the woods, and was able to make a careful study of their ways. I found my previous conception of their character and worth was in many ways erroneous, and it was my privilege to meet amongst these toilers of the forest many who were entitled to be placed in the category of "nature's gentlemen."

"Of all the pleasures which a bountiful God permitteth his children to enjoy, none are so dear to some hearts as the music of forests and streams, and the view of the beauties of His glorious creation," says George Borrow in one of his delightful books. These sentiments seem to be imbued to a marked degree in the shantymen, amongst whom I have found a love of the beautiful, and an admiration for the things which are noble and good, which one would hardly expect to find amongst men living such hard, rough lives. The true bushman—he who has spent the greater portion of his life in the bush—experiences a perpetual delight in surveying the pine, the birch, the maple, the cedar, the balsam and the spruce. I have seen these rough "hewers of wood" stand and gaze almost lovingly at a giant pine, and I have heard them speak almost reverently of some stately tree soon to become a victim of the log-cutter's axe. In the same way the glories of sunrise and sunset; and the ever-varying scenery of the bush seem to bring joy to their hearts. Their devotion to wives, mothers and children is another marked characteristic with many of them. Never did exile await with more eagerness the arrival of news from home than does the shantyman. Without a murmur as to his lot he works hard and ungrudgingly through the long, lonely fall and winter, cheerful in the knowledge that the money he is earning will add to the comfort and happiness of loved ones at home.

In a long experience of newspaper work I have associated intimately with "all sorts and conditions of men," but never have I come across any, who, taken as a body are more contented and happy than the shantyman. Whilst they are in the bush they are far removed from the temptations and vices of the cities; they have good food, and warm, comfortable quarters; and though the work is hard, and oftentimes dangerous, the healthy, regular life which they lead, cannot fail to promote contentment.

The shantyman frequently met in the cities must not be taken as typical of his class. The true bushman is a native of the rural districts; he is, and always has been, accustomed to a quiet and lonely life, and the solitude of the bush is never irksome to him. He is often a prosperous farmer, working his farm in the summer, and going to the bush when the harvest is in, so as to save money during the winter to add to his stock when spring comes round again. The man from the city who goes to work in the bush is rarely a success. He is usually thriftless, dissipated—when the means of indulging in dissipation are at hand—and discontented. He yearns for the bar-room and its associations; indeed, too often it is because he has squandered his last nickel in drink that he is compelled to go into exile in the bush, work at other callings being unobtainable. When once in the shanty, however, even in his case, the beauties of nature have, to a considerable extent, a refining influence upon him, and he is no longer the objectionable hoodlum he proves himself when around his city haunts. Drink and other temptations are many leagues away, and though his language may remain florid, his behaviour in other respects, is from sheer force of circumstances, fairly exemplary, and his better nature asserts itself. If he does make himself obnoxious to his fellow workmen— as is rarely the case— his own life soon becomes unbearable, so that it is to his own interest to make the best of things as he finds them.

The Fondness for Booze

A fondness for strong drink, as they themselves will tell you, is a failing with the majority of shantymen, but it must be remembered that this weakness of theirs, on account of their long sojourns in the wilds, can only be indulged in for brief periods. The departure for camp is usually the occasion for a big "drunk," and every fresh batch of arrivals in the shanties, includes men in various stages of intoxication, some suffering so much from the effects of their libations that they are incapacitated for work for a day or two. The genuine bushman, the real old-timer, however, never gets anything but "respectably drunk," and though his gait may be unsteady, and his speech a trifle incoherent, he becomes neither obstreperous, nor quarrelsome. He may find himself a little shaky "the morning after," but is ready to turn in and work with the best of them. It is after the break of camp, however, that the really immoderate dissipation takes place. After six or seven months steady work in the bush, where they have had no opportunity for spending, the men return to their homes with a substantial wad of bills in their pockets, and in their brains the impression that they have "money to burn." Without a thought for the morrow many of them set out upon an uproarous "spree," spending fast, furiously and foolishly. Some of them go on a heavy drinking bout, which only terminates when the last of their hard-earned cash has been recklessly thrown away in the saloons. I have known cases of men who have suffered cold whilst working in the bush rather than spend a dollar or two on new clothing; and yet the hundred or two dollars which they have drawn in wages at the end of camp have been squandered to the last cent a few days after their return to civilization.

The men are robbed in a most outrageous manner by certain unscrupulous hotel-keepers; and this is a matter which calls for drastic legislation on the part of the government. Very often when the shantyman's last dollar has been exhausted and found its way into the coffers of a greedy and heartless hotel-keeper, the latter continues to fleece his victim in a cruel and flagrant way. He knows that the poor fool will have to go back to the bush to earn more money, and therefore allows him to run up a big "board bill," which is paid for by the lumber firm when the man has earned sufficient to liquidate it. This is a practice which leads to very serious abuses. The unfortunate victim, with his system sodden with drink, becomes careless and irresponsible, and most likely dejected as he bewails the disappearance of his savings; and in order to drown his sorrow requires more liquor to solace him. The Boniface allows him to have what he requires, and sees that the befuddled bushman also buys freely for regular frequenters of the bar; then when he has given as much credit on the man's prospective wages as he cares to do, he charges all the liquor as "board," turns his ruined customer adrift, has him shadowed until he starts work again, and then sends on his "board" bill to the employer.

Unscrupulous Robbers in Hotels

One foreman told me of a man who entered camp with a board bill—inreality a drink bill—of one hundred and seventy-five dollars against him, and his earnings for the whole of the winter were absorbed in liquidating that debt. Men, when they become incapably drunk in the saloons are frequently taken upstairs and put to bed. During their sodden slumber the proprietor enters and places half a dozen empty whisky bottles in the room. "What are these doing here?" asks the occupant when he awakes in the morning. "That's what you and your friends drank up here in this room last night," replies mine host mendaciously. "I have no recollection of it," says the victim. "Of course you haven't," comes the answer, "you were too drunk to remember anything." And forthwith six full bottles of liquor which he never had are charged up to the man's account. Of course it is a convenience to a man who finds himself stranded in a strange town, but who has work in the bush to go to in a few days, to be able to obtain food and shelter at a hotel on the strength of wages yet to be earned; but the saloon keeper who robs his guest in the way I have described should not only be made to lose his license but should be given a stiff term of imprisonment as well.

As many of the camps are situated long distances from the nearest railroad station, involving sometimes two or three days' walk or drive over rough country, it is rarely that liquor finds its way into camp, anad then only in small quantities. Very often a new arrival brings in a bottle secretly for his own private consumption, or for friends already settled in the shanty. In smuggling in a bottle of the coveted beverage great caution has to be maintained, for even if the foreman has not put his ban upon it, there are always thirsty individuals who, though honest enough in other ways, are by no means particular in their observance of the eighth commandment when a good stiff drink of "tangle foot" enters into the question. To relieve a new arrival, and especially a "greenhorn," of his bottle is considered good sport by all, even if the valise in which it is secured has to be tampered with, and the incident usually causes a good deal of merriment, which is greatly increased when the owner, who has probably been reckoning upon an occasional "snort" on the sly for several days to come, discovers his loss, and vows terrible vengeance upon all and sundry. Sometimes the new-comer will hide his bottle in the bush on his way into camp, but there are always sharp eyes about, and even if he has not actually been seen to deposit his treasure, he has left his footprints, the meaning of which will be investigated and solved by the next passer-by. However careful a man with whisky in his possession may be to conceal the fact, he usually, either through excess of caution or some similar reason, contrives to arouse suspicion and many are the cunning ruses devised to relieve him of the coveted liquid.

There was in our camp a Norwegian named Johnny, whose fondness for the bottle was proverbial. He had been home for Christmas and upon his return there were not unreasonable suspicions that he had brought some "tangle foot" back with him. When questioned on the point he strenuously denied the soft impeachment, and though his denial was accepted by the bulk of the shantymen, there were three of them who were not satisfied, especially as Johnny had been boasting previously, of the big jar of whiskey which he had ordered to celebrate the festive season. Moreover, it had been noticed that "Johnny" had removed his heavy coat with almost motherly tenderness on his return; had deposited it with extreme care in his bunk and had forthwith sat down beside it to keep guard. The three dubious ones decided to act in concert, and at all hazards to secure the bottle if Johnny had one about him. After a hurried consultation it was decided to send a false message to him to go to the office. Before departing to obey this summons, he confided to a trusted Norwegian friend, Charlie, that he had in truth a bottle of whiskey in his top coat, and with a promise to share up asked Charlie to keep a careful watch. For the three conspirators there was now the additional difficulty of getting Charlie out of the way, but a plan of action was quickly decided upon. One of them left the camp, but hurried back again immediately, and going up to Charlie with a look of intense alarm he exclaimed, "For heaven's sake come outside and listen to the wolves howling. They're right outside the camp. It's positively awful." Poor Charlie was caught napping. He rushed outside and as soon as his back was turned, another conspirator ran over to Johnny's bunk, snatched the bottle from the coat, and transferred it to his own, and then went back to his own seat with a look as guileless as any that ever adorned the face of a saint. A minute or two later when Johnny returned and found how badly he had been fooled his countenance was one of woeful dismay, whilst outside in the darkness the three conspirators could be dimly discerned disposing of the contents of the bottle. The grunts of satisfaction and the suppressed laughter which proceeded from their midst left no doubt, not only that the whiskey was appreciated, but that the joke at the expense of the two Norwegians was considered a good one.

Gambling Generally Tabooed

One occasionally hears stories of shantymen losing all their winter's earnings through gambling amongst themselves, but such cases are isolated, and whatever other vices they may have gambling is certainly not one of them. In a well regulated camp it is strictly forbidden by the foreman. It was so in the camp in which I was located, and though occasionally a plug or two of tobacco may have been staked upon a game of cards it was done secretly and certainly never reached any serious proportions. The winter evenings are long in camp, and a hand at cards—the only indoor amusement available—helps much to relieve the monotony.

"As hungry as a hunter" is an epigram the truth of which many a city toiler has proved during a brief visit to the bush in the hunting season; but the bushmen have hunter's appetites all the time. To see one of them sit down to dinner and demolish a couple of thick chunks of beef weighing well over a pound, together with a big supply of potatoes, baked beans, turnips, carrots, and bread, with a huge piece of pie, and probably some cake and prunes by way of dessert, might well make a dyspeptic millionaire envious. The food is plain, plentiful and good; and with a skilful cook, there is a greater amount of variety than might be expected where the means of transportation are not of the best. The men eat from metal plates with iron knives and forks and drink out of tin tea dishes. In a three course meal the plate, being washed, does duty successively for the soup, meat, and dessert, and although the latter gets hopelessly mingled with the fat, grease, potato crumbs, etc., which have preceded it, this fact does not impair the men's relish of its delicacy. Although pork and beef are the only viands supplied in camp, many of the occupants of the shanties have guns, and, the law notwithstanding, venison, partridges, etc., do occasionally make their appearance on the dining tables in season and out of season.

Profanity, I am sorry to say, is a failing not uncommon with some of the shantymen. They indulge in the practice heedlessly, and without thought of wrongdoing. Oaths slip out all too glibly, especially in the case of teamsters, who, in urging on a slow or obstinate horse, use language remarkable alike for its violence and originality.

In spite of his faults, however, the shantyman is at heart a good fellow. Although so many of them are thriftless, and squander their money recklessly, there are others whose thoughts are, first and always, for the welfare of their wives and families. I know many fathers among them who toil long and laboriously, spending the greater part of each year in exile in the bush, in order that they may save money to give their children a good education and enable them to start out on the road of life better equipped than they were themselves. During my career as a shanty clerk I met many such men—men whose acquaintanceship I should never be ashamed to acknowledge, but whom on the other hand I should be always pleased to grasp by the hand and call my friends.

Cost of Making Pulp and News Print Paper

The United States Tariff Board's full report of its investigation of the pulp and news print paper industry in the United States and Canada has been made public.

Summarized briefly, the report says that a ton of news print paper is made in Canada for $5.35 less than in the United States. The average Canadian cost is given at $27.53 and the average cost in the United States at $32.88. The duty upon a ton of news print paper under the present tariff is $3.75.

Several factors entering into the increased cost of manufacture in the United States are taken up exhaustively in the report. The principal increases are said to be due to the fact that a ton of pulpwood cost nearly twice as much in the United States as in Canada, and that many of the American mills have much older and must less efficient equipment than the Canadian mills, which is said to be responsible for a larger increased manufacturing cost.

It is declared that in 44 per cent. of American mills investigated a condition exists as to machinery and equipment which would force them, if obliged to meet really extensive competition from Canada, greatly to curtail other expenses, greatly increase their investment for equipment or shift to making other kinds of paper.

In treating upon the subject of labor efficiency in Canada, the report says:

"It would seem, then, that with modern mills American machinery, American trained managers and superintendents and American skilled operatives, together with lower rates of wages for unskilled men, the Canadian manufacturing labor cost per unit of production in the modern and well-equipped mills of Canada would be considerably lower than in the modern and well-equipped mills of the United States.

"The wages in the groups of occupations in which the proportion of skilled employees is large—as, for example, occupations in news print paper mills—are shown to be higher in Canada than in the lake States, while the contrary is true of the wages in the groups of occupations, in which most employers do work requiring little skill or training. This is probably due to a relative scarcity in Canada of skilled workers. The representatives of the Tariff Board found that in the Canadian mills visited most of the unskilled workers were Canadians of French descent. On the other hand, nearly all of the employees in the better paid occupations were of the English-speaking races. Many of these men were of American birth or had worked in paper mills in the United States, and had been drawn to Canada by advantageous offers of employment."

Greater Interest in Forestry

The closing of the fourth year of the faculty of forestry of the University of Toronto shows substantial progress in the work of this department. Four years ago there were eight students; this year forty-five wrote on the various examinations. Forty of these have already found employment for the summer in their line of work. Twenty will be employed in the Prairie provinces and British Columbia by the Dominion Forstry Branch; sixteen go to private firms or corporations, three are fire ranging and the remaining five have been delayed in getting to work by reason of examinations in other faculties. The firm which was the first to employ forestry students in its limits will have a party again this year.

The average age of the class was somewhat higher than last year (23½ years), showing the mature character of the students.

The following list of places whence students come shows the standing which Toronto has attained in its four years' existence. The city of Toronto, 19; Province of Ontario, 14; Nova Scotia, 2; New Brunswick, 3; Quebec, 2; Alberta, 1; British Columbia, 1; and United States, 3. Dr. Fernow, the dean of the faculty, stated that the progress made was gratifying, but at the same time expressed the belief that another year would see further advancement.

The Retail Dealer and His Problems

Keeping Track of Material—Retailers Organization

Tabulation of Material on Hand

In the contest for articles upon "Bookkeeping Systems in a Retail Lumber Business," recently conducted by the American Lumberman, the first prize article, contributed by a Canadian, was reproduced ecently in "The Canada Lumbeman." A special prize has also been given for an article contributed by another Canadian, Mr. S. Shaw, of Dresden, Ont.

Mr. Shaw's article is as follows:—

Keeping Stock Record

I send you herewith specimen sheets which should be self-explanatory, but a few remarks may help to demonstrate more clearly. The piles of lumber, etc., would be numbered and a piece of dressed lumber, say 1x6—4 feet nailed to each pile. The order (Fig. 1) would be made out in the office, handed over to the yard salesman, who, after filling each item, would mark the number of pile and the balance still in each pile (taken from the record on the dressed board). The customer's bill (Fig. 2) would then be made out in the office. When delivery is made the customer simply signs the receipt, tears off at perforation and returns the receipt to the teamster and retaining the itemized bill himself. The pile record in the office (Fig. 3) is a perfect check on each pile, for if the salesman sends in a wrong balance it would be immediately detected. It also gives proper record in feet of purchases and sales. The postings to the ledger (looseleaf) is done direct from the counter checkbook for merchandise and received on acount. The counter checkbook record (looseleaf, Fig. 4) is placed at right hand when posting, being used the same as the reverse posting slip, and each time an amount is posted the same amount is placed in its proper column, the difference between the credit and on account columns always will show the amount outstanding. Each day's sales and the total of the received on account are each posted to their respective columns in the cashbook.

Fig. 3—Stock Record, book form, 8.5 x 13 in. wide

My ledger is kept in two sections, termed sales ledger and general ledger, there being separate columns in the cashbook from which to post the different amounts to their respective ledger sections.

S. SHAW, Dresden, Ont.

In a supplementary letter Mr. Shaw says:

In the charge sales column in the book record, should there be any material returned or credited, and with no debit entry, the same is deducted from the following sale or sales.

My aim and claim in bookkeeping is that postings should be made as direct to the ledger as possible, and to eliminate all unnecessary entries, but consistent with proper check or proof as to correctness (as all are liable to mistakes), and this I think is exemplified in this system. The carrying of entries to the cashbook and thence to the ledger I contend is useless, as in this system of posting everything direct to the ledger from slips you are assured that if the totals of your cash sales and on account are correct, then your postings must be correct. My books are kept double entry and books from which postings are made are provided with a separate column for sales and general ledger (even my billbook from which I post direct to ledger), which provides for any entry that could possibly be made. My billbook is also provided with an interest column to provide for interest that may be added to an account or a renewal note, and there is also a column showing the face of the note, the postings of which are both made to their respective accounts each month. In this enclosure there is copy of statement issued to employers each month, the items of which are readily obtained. The explanations herewith, together with former letter, should, I think, give you full understanding of the system.

Regarding Mr. Shaw's article the American Lumberman says editorially:—

It will be noted that the contributor has hardly described a complete bookkeeping system, confining himself largely to billing and charging and stockkeeping system; but here he seems to have hit the target plump in the centre and such criticism as may be offered will be on details rather than upon the plan itself.

The stock system described is the only one contributed which keeps the record at the pile or bin and in the office as well, checking one against the other. It is, of course, more work than to keep the office record alone, but it is bound to accomplish results, and the other plan has often been tried and abandoned in disgust, because the man keeping the office record did not have the cooperation of the man or men keeping the pile and discrepancies were bound to get in which would not be discovered until long after the opportunity for running them down had passed. Here the man on the yard knows that nothing can happen to the pile without a ticket for it, without its being discovered.

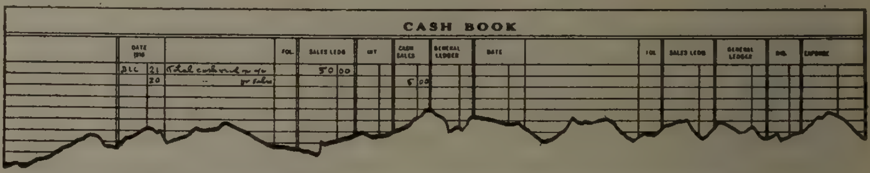

Fig. 7—Cashbook Form, debit and credit sales separated

There is one additional detail which would connect the pile record more closely with the actual pile contents. Most stock is dimension, a given number of feet in each piece, and a given number of pieces to the course. Beginning from the bottom and marking the end of the last right hand piece of each fifth course with its numerical number with an indelible lumber crayon, and extending the marking to new lumber as added, the actual pile contents can be determined very quickly at any time by reckoning only from the highest number marked to the top of the pile. On random stock these numbers would show feet instead of pieces. This will apply, of course, to any bin in which the material is regularly stacked, or to any other merchandise items which can be so arranged in stock as to be taken out in a predetermined order. On items such as saws or planes in hardware stock, where only a few are carried, the record can be dispensed with and balance on hand marked from an actual count of the articles. With the numerical identification suggested certain numbers could be assigned for checking up each day to see that the stock record agrees with the actual stock, thus keeping the record perpetually in line and doing away entirely with the fuss and bother and almost inevitable errors of the yearly or half yearly inventory.

The contributor describes a 1x6—4 foot dressed board for the bin record. Such a piece in most yards is worth, say, 4 to 7 cents; a weatherproof card costs a fraction of a cent, and is better, neater and could be used for stock items where there would be no room for the board convenient to the item which it is to record. A form for such a card is here suggested (Fig. 5). If exposed to weather it must be marked with indelible lumber pencil and should therefore be ruled with ample spaces for large figures.

On the form shown every fifth line is ruled heavy. It probably would serve the purpose of checking the balance and save labor if on the ticket to be entered on this fifth line the balance were noted forward and on other tickets only the bin number, thus giving a check balance with the office record on every fifth item. In the "In" and "Out" columns a small space is provided for bringing down the total of the five tickets for striking the balance. This total may be made in small figures with an ordinary lead pencil, being of only transient use. New balance is brought down to "In" column, so only the five new lines need totaling for next balance.

The forms submitted show duplicate order sheet and a duplicate sales ticket, which is not made until the yard order is filled and returned. Often the sales ticket is made in triplicate, the third copy being provided for a driver's receipt. This is ingenuously avoided here by a perforated stub to be signed by the customer and detached from the ticket that is left with him, being identified with it by the number and requiring no extra writing. Some of our friends are making the sales ticket and its copies act also as the yard order, and would object to the double writing a separate yard form involves. The order form could easily be dispensed with and still without the bother of making a triplicate. Let the duplicate have the extra columns required for the stock record and hold the original until the duplicate is brought in from the yard. The original is then released to go to the customer, together with the receipt stub, and the duplicate then becomes the office record, both for money posting and stock posting.

The ticket form shown carries two sets of numbers, "Book 1" and consecutive "No 2." In practice this should be "No. 102," the tickets in Book 1 beginning with 100 and running serially, in Book 2 with 200 etc. If fifty tickets are used to a book, the numbers should run from 00 to 49 instead of from 1 to 50, though this is more important if the numbers from 50 to 99 are also used, as in the flat book form they often are not. Ticket 300 should be the first ticket in Book 3, not the last in Book 2. If two books are used to each hundred numbers, the one beginning with 150 is usually known as Book 1½ or 150 or 1B.

The ledger charging is done direct from sales tickets and as each is hndled it is listed on the "counter check" form, which accumulates the total of charge sales, cash sales and cash on account, to be posted through in daily total to the respective accounts, balancing the individual charges to customers. But one writing of the amount for each ticket is necessary, the lines being numbered up to 50 to correspond with the sales ticket numbers. There are five of these sets of columns on the form submitted, taking care of five successive sales books. If a merchandise distribution is wanted, the sheet could be arranged for as many classification columns as desired; and as all sales go through these underscored and date noted. Quantities short or over sheets the class postings could go direct to ledger accounts and only a single column for merchandise carried on the journal, which would of course, control and balance with the distribution merchandise accounts of the ledger.

The stock record is a book with several sets of columns to the page, one for each stock item in numerical order. Apparently each item is posted direct from the ticket, which fills the stock record rather rapidly. The second prize system used distribution sheets to take the sales ticket amounts and only the weekly totals went to the stock record cards. It is desirable to have an additional column in which to record car numbers on purchases, or order numbers if numerical purchase orders are used, and an additional column for unit prices paid, as a useful running record of cost. Often the minimum quantity to allow before reordering and the quantity to order are also noted at the top of each item. If the suggested plan of periodical checking with actual stock is adopted, balances which have been so verified are to be on inventory should be noted in red ink as a plus or minus quantity in the sold column (never in receipts) and the corrected balance extended. If it seems desirable these can be put into the regular books (at cost price) in a merchandise short and over account, which when closed to profit and loss would show the total of such discrepancies. The contra debit or credit, of course, goes to the merchandise account and this merely segregates the stock discrepancies from the general merchandise results. Stock returned should also be entered in the sold column within a circle to indicate a reversed quantity, as a subtraction from quantity sold rather than in bought column as an addition to quantity bought, which it is not, as the contributor says.

The contributor posts directly to customer's ledger account and makes his monthly statement from it, a general practice; but an improved time-saving method has already been described in previous articles. The indebtedness of the lumber trade in general to Mr. Shaw for having contributed a method of keeping stock that is bound to work if given a half-way fair chance is, however, a sufficient halo for any one lumber accountant.

One of the above suggestions involved two additional columns on the sales ticket duplicate to take the stock entries, doing away with the separate yard order form. The corresponding space on the original or customer's copy would be dead space. The original might be that much narrower, but to make sales books that way is much more expensive. Mr. Teesman in his customer's invoice used the left margin, which on the original and triplicate was needed as a binding margin for the post binders, for a well worded printed reminder of the terms of settlement, and this plan could well be followed in arranging the form suggested, or the customer's detatchable receipt described by Mr. Shaw could be well arranged for this space.

Growth of Retailers' Organization Movement

A meeting of secretaries of the leading retail lumbermen's associations of the west and middle west of the United States was held at St. Louis, Mo., recently, at which the most important matter under discussion was the outlining and consideration of a plan for bringing retail merchants in all lines of trade in the United States into one general confederation. The movement for such an organization has been going forward with increasing impetus during the last year.

In Canada a similar movement has already been put into effect under the guidance of the Retail Merchants' Association of Canada. The secretary of this association, Mr. E. M. Trowern, was requested to write his views upon the movement for the benefit of the St. Louis meeting and he accordingly forwarded a letter which was read before the meeting and was received with much enthusiasm. His letter was as follows:

Dear Fellow Retailers—As secretary of "The Lumber Dealers Section" of "The Retail Merchants' Association of Canada," I regret very much that I cannot be present with you at the conference of secretaries, and at the convention of Congress of Lumber Dealers being held in the city of St. Louis.

I need not tell you that while I am a citizen of Canada, and living under another flag, and endeavoring to do my small share in improving the legislative conditions of my country for the benefit of the hitherto unrecognized class, the great body of retail distributors, our sympathies and our aims stand on common ground, over and around which no imaginary line can be drawn. What your deliberations may be, will help us, and what our deliberations may be, I hope will help you.

For years, I have recognized, that both in Canada and in the United States, a single line of trade, standing alone and unprotected, secures no support from legislators. And, unfortunately, no matter what evils may exist, or what trusts or monopolies may be formed among those higher up—I mean the manufacturers, or those lower down—I mean the workman in the mill, the poor old retailer is singled out, and made to pay the penalty for them all. He is held up by politicians, as being an unnecessary quantity, scoffed at by socialists and the press as being the middle man who causes all the trouble, charged by women's clubs and co-operative buying societies as being the cause of high living, and chased by the courts because he attempts to protect himself and secure a living for his family. While all this has been going on, we have been sitting silently by and almost apologizing for being on earth. In Canada, I am pleased to say that we are grasping the larger vision. We are rapidly recognizing that retail distributors in all lines are a very necessary part of the community.

We are the natural channel through which all merchandise must flow, so as to place it conveniently and economically at the doors of the consumers. As a commercial class our power is beyond comprehension. We occupy more land and more buildings, employ more help, pay more taxes and insurance, own more horses, have in our possession more merchandise, and extend the helping hand in the way of credit to more people than any other class on earth. Take away the retailer and you will destroy the cities, towns, and vil-

"The

BERLIN 108 OPEN

108
BERLIN MACHINE WORKS
HAMILTON, CANADA

Berlin Machine

Hamilton -

Original"

SIDE MOULDER

The No. 108 is not an inside moulder nor an outside moulder. It is a combination of the good features of both these types. From the inside moulder we have used the solid bed, the powerful feed works, and the rigid cylinders. From the outside moulder we have used those desirable features of accessibility.

The No. 108 is a heavy substantial machine built on a rigid one-piece frame which forms a very solid foundation for the working parts. There is no overhanging machinery, for the working parts are all built directly over the frame. This one feature goes a long way toward making it the most substantial moulder built.

The No. 108 has other features which you will appreciate. Glance at the picture and note the large powerful feed works, the rigid mounting of the cylinders and side head spindles, and the long adjustable wooden shoe which bears firmly on the stock all the way through the machine.

Then there are features of accessibility which can not all be seen in the picture but you will appreciate these when we tell you. The knives are easy to get at when you want to alter or sharpen them. All adjustments are made from the front side of the machine.

But, here is the point which is most significant in the value of the No. 108. It is the product obtained by expert designers who have been over the moulder proposition from A to Z and back again a great many times. In this moulder are contained the latest improvements known to modern wood working machinery construction.

To you these fine mechanical points are of little interest, but you who are daily using wood working tools appreciate most keenly how much profit there is to be obtained from a good moulder.

45 No. 108's sold and shipped last year. Why? Because one man bought, others learned what he was doing with it, and bought too.

If Berlin Tools are a "dollars and cents" proposition in his business why not in yours?

Before you decide on a moulder, we would like to explain the No. 108 to you. We are sure you will then appreciate what we mean by the term "Original Open Side Moulder."

Works, Limited,

- Canada

lages of North America, yea of the whole world. Then why should we apologize for living? Why should we sit in silence and be afraid to demand a fair living profit for the time, knowledge, and risk we take in trying to earn an honest living? The only answer I can give is, that we have been abused so long and we have heard so many charges made against us, that some of us have almost been persuaded that the charges are true, and that we had better give up the struggle, and lock up our shops and our yards, and go back to the earth. As a single line of trade, you form but a mere line or thread stretching slimly from ocean to ocean. Your votes can be counted, your influence is lost as soon as you mention your name, and you can no more influence your legislators to change some unfair law than you can build a railway to the moon.

But supposing you were united as one class, and you had behind you the mighty force of the great body of retail merchants who want what ~~you want, and~~ who are all aiming to preserve those fair and honorable methods of trade that have made the commercial nations of the earth great. What could your legislators do? Fancy, every store a committee room, and every retail merchant a propogandist, urging upon those seeking election that they must give them fair and equal rights, and not give the laboring man, and the farmers, and the doctors, and the lawyers, all the good things, and encompass the mercantile classes around with laws that mean that they cannot be trusted.

Take your Sherman Act, which prevents the manufacturer and the wholesaler and the retailer in any line of trade from sitting down and determining as honest men, what profit they should place upon their goods, so as to enable them to pay their honest debts, and get a fair and decent living for themselves and their families, and then reflect that while you are denied this privilege, that the working men and trades unions who have no capital at stake, and who can move from place to place, are exempt, that they are omitted from the act, which might be taken to mean that they can be trusted to make fair agreements, but reputable business men who have all they possess staked in the community, and which can be taken away from them, are open to the whim of some imaginary grievance, and from some prejudiced persons, who may charge you, rightly or wrongly, with conspiring or agreeing among yourselves. Or, in other words, if you as business men attempt to make a fair profit and attempt to regulate your trade, it is a crime, but if the laboring men fix the value of their wages, or the government fix the rates for railroads, or for postage stamps, or customs duties, it is an honorable business proposition. This is only one item that I am calling your attention to, and I feel sure that if you will only grasp the larger vision, that you will see that the only way in which you can "get out of bondage" is to join in with the large procession, and free yourselves from the yoke that you have been laboring under for so many years, and which I am pleased to say we, as retail merchants in Canada, have freed ourselves from, after our government had copied your Act and made it law.

The manufacturers, both of Canada and the United States, operate, not under a host of little manufacturers' associations, but under one organization. The farmers do likewise, and so does organized labor. Why then should not all retail merchants line up under one banner? Each class of trade having their own sections, each meeting discussing their trade troubles and their trade improvements, but all operating under one class, one name, and one constitution.

I regret that time and space will not permit me to touch on some other important matters that I am sure we are all interested in, but I hope that some time I may have the pleasure of going more fully into this very important and interesting subject with you. In the meantime I hope that the retail lumber dealers of the United States will be pioneers in advancing the movement, whereby eventually every retail merchant in America will see that it is not only his duty, but that it is absolutely necessary for his protection, that he should line up and step into the procession that will eventually lead him out of the wilderness of confusion and disorder, and bring him safely into the promised land, where he may find a fair trade policy, suitable for the millman, the manufacturer, and the retailer, and where all are servants, one of the other, and yet all are masters, and all sharing an equal reward for their labors.

Wishing you all prosperity and trusting that your deliberations may result in great good to us all, I send you our greetings and good wishes from the Land of the Maple,

Yours sincerely,
(Signed) E. M. Trowern,
Dominion Secretary.

Relation of Retailer to Wholesaler and Manufacturer

By R. F. Vaughn

How many of our retailers have though before placing our orders for our spring trade what effect our requirements had on the manufacturers and wholesalers. We are too prone to sell the regular No. 1 high grade long length stock that everybody wants, that every retailer buys, and that all our good friends, the consumers, call for—items that always bring the top of the market. Why not reduce purchases of this stock to a minimum—cut them down all possible—buy a good lot of six, eight and ten-foot ceiling and flooring, which can be sold by careful salesmanship for eight and ten-foot, for eighteen-foot and so on. These items will cost you at least one-third less, and can be sold for as much as the long lengths. Short length siding can be used in unlimited quantities, even as short as six-foot, and can be bought for a ridiculous price.

The narrow three-inch shingle in good quality is also a ready seller and a strong competition leader. You can buy them for $2 and always sell them for more than your usual margin of profit.

Odd pattern siding is as good as any, and always a snap. Off beaded ceiling and partition also are good sellers to the consumers, if judiciously sold where they can be used throughout in a house. They can be bought at from $8 to $10 less than regular stock.

Short length sheathing and studding, 2x4 and 6, bring a splendid profit; No. 2 and No. 3 stock for concrete forms and for sidewalks are ready sellers. By buying these items, pushing the sales and introducing their usage, we can accomplish many things.

First, we can create a demand for this drug on the market, thereby increasing their price and bringing the wholesaler and manufacturer more money, which means more net money for the log and means in the long run a loss—if the manufacturer is not greedy enough to take it all—for the stock we all have to sell—16, 18 and 20-foot boards, dimension, piece stock, flooring and ceiling. It means that we will be helping to conserve the timber itself by using it all, and that we will have more timber to sell, and longer to sell it in.

The lumber trade has been getting in a rut, with our farmer and ranch friends buying the staples, like sugar and cogee, taking our good, high prices, long length boards and cutting them up, our flooring and shingles and building barns, houses, etc., out of them, while if, knowing what they can use, we can give them this material, which seems more profit to us, and the same result to our customer.

Our wholesaler anl manufacturer friend can help us much more than he does by being more careful in his educating the people at large, as to market value, by being more careful in sending out his pricelists, and by being less active in trying to get every carload order he can.

How many of us retailers, on selling a bill of material, are confronted with such and such company's wholesale list, or by some obliging company that had quoted our friendly customer, reserving perhaps a dollar for ourselves—now, who on earth was ever satisfied with a dollar?

Whenever there is a government contract to be let in our town or a large bill sold, you and I have to give up some of our profit or lose the bill. We should all hang together more closely; the retailer should help the wholesaler and manufacturer by creating a demand for the drug on the market; the wholesaler and manufacturer by protecting that dealer with his trade, as far as he legitimately can.

I want to add that I believe that we retail lumbermen are confining ourselves too strictly to selling lumber itself. Other building materials are coming to the front, and we should be the ones to handle them. Cement, concrete and steel, plaster and composition products are being used extensively, and are taking the place of lumber. We should study these carefully so as to be able to handle them intelligently, and, as our customers demand same, be able to furnish them. It will be only a matter of a few years until these items will be substituted for our lumber, and unless we prepare ourselves to handle these materials, we will find that we have not only lost our business, but we have been set aside by the progressive and up-to-date dealer.

In conclusion, the hardest problem we have to face is our mail order competition, which in the last four years has grown very largely. We must realize that our mail order competitors have the same right to continue their business as we have ours. I believe we can all hold our own for the following reasons: Our customers are our friends and neighbors, and they must realize that we share the burdens of taxation and all other expenses of upholding the community; that we spend our money with them and are entitled to a reasonable profit. They see what they buy, return what they cannot use, get for a fair price items they forgot in their original bill, get credit from us when they are worthy of it (and sometimes when they are not); while with a mail order house none of these facts obtain. Very ofter a poor grade of material is shipped them in erroneous lengths and sizes, and they have no recourse, as they must pay for the material before they get it. In our experience we have found that when our customers have bought from mail order houses their shipments have been a good advertisement for us. The grades have not been satisfactory, shipments delayed, many items short, shingles and openings and other things left out; and by the time the customer has bought these items locally he has not saved any money, and has been annoyed and delayed.

Machinery and Equipment

What Manufacturers of Logging, Sawmill and Woodworking Appliances are Doing

Improved Band Sawing Machine

The accompanying illustration shows one of the four sizes of improved band sawing machines built by the Silver Manufacturing Company, of Salem, Ohio. These saws are made with wheels with a diameter of 20, 26, 32 and 36 inches.

The patterns are new throughout and include the latest improvements. Many special features are included in these machines. There is a handsome frame that rests on the floor on all sides, thus adding strength and solidity and insuring cleanliness around the machine.

Silver Mfg. Co's Band Saw, with Tilted Table

Silver Mfg. Co.'s 20" Foot Power Band Saw

It also has a patented device for tilting the table for angle sawing, by which a turn of a handwheel loosens or rigidly fastens the table at any desired angle up to 45 degrees. A belt shifter is included that can be used either above or below the pulleys, making a shift a certainty, no matter from what direction the power is applied. Instead of being low down under the table, the shifter is within easy reach of the operator's left hand and can be instantly fastened where desired by a turn of a thumbscrew. The operator can adjust the upper wheel from his position while the machine is running and also has full control of the up-and-down adjustment of the upper wheel from the same position.

The 20 in. band saws are made in three styles; for foot power only, for combined foot and belt power and for belt power only.

The foot power mechanism is entirely of metal and is a marvelous improvement over the ordinary complicated construction. It is both novel and valuable, one of the two gears employed is keyed direct to the lower wheel shaft and the other travels around it, producing a powerful two-fold speed.

The new catalogue of this company fully illustrates and describes the different sizes of band saws, as well as a line of jointers or buzz planers, saw tables, swing saws, etc., hub boring and spoke tenon machines. Some of these machines are shown in their advertisement on page 49 of this issue.

For further particulars address The Silver Manufacturing Co., 375 Broadway, Salem, Ohio.

The Goodyear Lumber Company, of Buffalo, N. Y., have favored their friends with a very attractive illustrated catalogue, descriptive of the Barnhart log loaders, which they manufacture. These loaders are well known to the lumber trade. Several of them are already in operation in Canada and are giving good satisfaction. Operators in the Canadian woods would do well to communicate with the Goodyear Company and secure a copy of this catalogue. The idea of loading logs by machinery was conceived over twenty-five years ago. The Barnhart loader has been on the market many years and is now in use in all parts of America. The Goodyear Lumber Company who manufacture it, cut for years from 100,000,000 to over 200,000,000 feet of lumber per year, operating in the rough mountainous country of Pennsylvania. The Barnhart loader has been under all sorts of circumstances, conditions and weathers, and has handled logs in all positions. The total cost of loading logs with this loader is from 10c to 20c a thousand, which covers everything,interest and depreciation included.

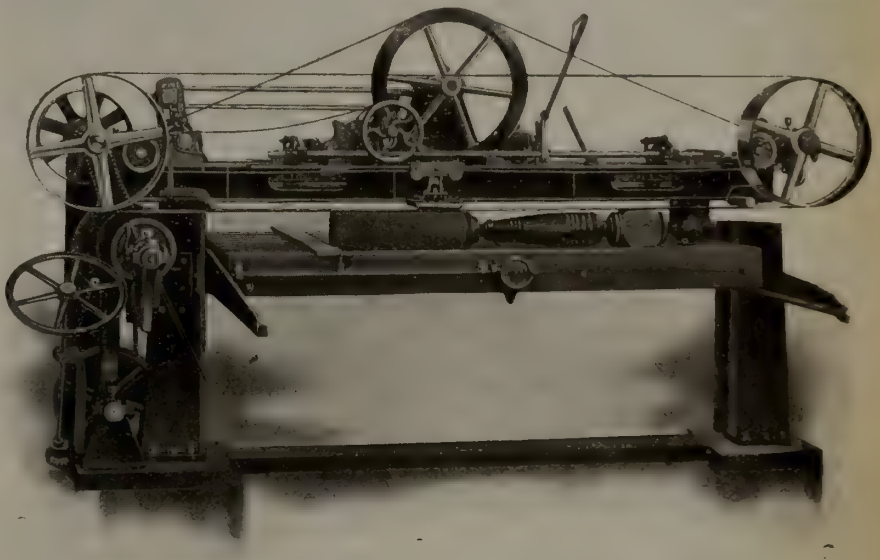
The Enterprise Manufacturing Company, Columbia, Ohio, have issued an attractive illustrated catalogue descriptive of their steam engines and sawmills. The policy of this company has always been to build the very best sawmill machinery and they confidently claim that their mills will produce lumber at reduced cost, and with greater accuracy than any other sawmill built. By way of substantiating this claim they point to the fact that thousands of their sawmills are in operation throughout the world. In addition to giving very complete information regarding the company's products, this catologue will prove of much value on account of the large amount of general information regarding sawmill matters which it contains.

An Excellent Automatic Belt Sander

The Fisher Automatic Variable Speed Belt Sander, which is illustrated herewith, is manufactured by the Fisher Sander Company of Berlin, Ont., manufacturers of sanding and rubbing machinery. This machine is specially designed for the use of wood-working factories, such as piano, organ and furniture factories, car shops, carriage factories, and all factories for the manufacture of interior hardwood finish. It will take work from the press and finish it without any hand work, ready for the varnish room, thus saving all hand scraping. The whole machine is constructed of iron, steel, brass and aluminum with the exception of the table which is of best seasoned material and travels on roller bearings. The sand belt is of the ordinary sand paper and has a working surface of 11 square feet with no waste of paper.

The company build their machines in two sizes, viz: 6 ft. long and 8 ft. long respectively.

Another machine manufactured by this company is the No. 2 Variety Belt Sander which is specially designed for the sanding of all kinds of mouldings, piano falls, opera chair seats and backs, and all irregular shapes.



Fisher Automatic Variable Speed Belt Sander

The whole machine is constructed of iron and steel with the exception of the table which is made of the best seasoned wood.

The Fisher Sander Company specialize on all classes of sanding and rubbing machinery and veneer presses.

The Smart-Turner Machine Company, Limited, Hamilton, Ont., report that trade is excellent. The following are among the numerous orders which they have recently filled:—Side suction centrifugal pumps for the International Harvester Company, Hamilton, Ont., and L. J. Looby, Owen Sound, Ont.; two pumps for the new works of the Acheson Oildag Company, Sarnia, Ont.; one duplex boiler feed pump for the Burrill Lumber Company, Three Rivers, P. Q.

THE WOODWORKER

Progress in the Fitting of Band Rips and Band Resaws

The introduction of modern band resawing has come about largely within the past ten years, and that of modern band rip sawing within the past five years, and now these economical agents for sawing a minimum kerf and at a maximum rate of feed are found very generally in use in the better class woodworking plants, particularly in furniture factories, planing mills, car shops, etc. Up to fifteen years ago there were comparatively few band resawing machines in use on which saws were employed over three inches wide. Now the sale for such narrow width saws is limited. The band wheels have been increased up to fifty-four or sixty or even seventy-two inches diameter with face materially wider, on which saws ranging from five to eight inches wide are employed. Indeed, there are some makes of band resaws that in all respects approximate the log band mill, both as regards general weight of the machine, diameter of the wheel and the width of its face, the saws being ten or twelve inches wide by fifteen or sixteen inch gage, and there are a dozen or more concerns in the United States and Canada busily engaged in the manufacture and sale of these resawing machines. Some of the manufacturers offer a considerable variety of machines, both as regards style of construction and special adaptation for varying purposes and it is surprising on how slight a kerf some of these saws are run successfully, and how thin and how smooth the resawed stock that results. The rate of the speed ranges up to one hundred or more feet per minute, and the variety of the stock sawed covers about all of the possibilities in hard and soft woods, both in green and kiln dried stock. The solid circular and likewise the segment resaws for many purposes have become back numbers regardless of the excellent record behind many of these machines.

The above changing condition has similarly brought about a radical change in the care of the saws and we now find the modern filing room equipped with a variety of saw filing appliances hardly thought of, or at least rarely found in use, fifteen years ago.

The old method of setting the teeth and filing by hand with little attention to the matter of leveling and tensioning the saw is no longer practiced, excepting in the smaller and the poorly equipped filing rooms. In place of the spring set the full swaging of each tooth, so that each tooth does its proportional share of the sawing, is almost universally employed and this explains in part the increased capacity of the band sawing machines, that is the adaption of the saw to stand a much faster feed than was formerly customary. The corners of the teeth are now in most filing rooms side-dressed with a swage shaper or pressure side dresser, which acts as a mould, beveling the tooth down and back from point to afford a perfect clearance, leaving the face and point the widest. Instead of the file as a means for sharpening the teeth the emery wheel is employed, used on an automatic band saw sharpener, which is capable, by easy adjustments, of producing almost any conceivable gullet outline both as regards spacing from point to point, hook, depth and general outline of the gullet that it is practicable to carry on a saw. These ready adjustments of the automatic sharpeners make it possible for the operator to shape the teeth with hook and outline of back and general outline of gullet whatever will be most serviceable for the character of the stock being sawed. Thus the tooth for sawing soft pine is different from that suitable for cotton wood or similar fibrous wood and likewise different from that usually employed on hard woods, in some mills where a considerable variety of stock is handled the filer may adopt a gullet outline fairly serviceable for all of these different woods, but in different plants it will be possible to find a hundred different gullet outlines employed, no two of which are exactly alike. The sharpening of the saw is accomplished at a speed of some thirty teeth per minute and with little or no attention on the part of the operator of the sharpener, and when the saw comes off the sharpener the width of saw will be maintained uniformly, the spacing of the teeth will be approximately or exactly uniform and the tooth will be fitted ready to run and do the best possible work. Again the tensioning of the saw instead of being done wholly by hammering, as was almost uniformly the case fifteen years ago, is now accomplished by the use of saw stretcher or roller, which expands all parts of the saw that pass through the rollers practically alike, according to the pressure that may be needful, and the filer who has a stretcher in use and understands its efficiency has little need to level his saws, because lumps, bends, ridges and twists are less likely to appear in the saw if fitted with the appliances above mentioned in an ordinary skilled fashion.

The care of band resaws and indeed of fine tooth band saws, small circulars and machine knives is becoming a trade and mill and factory operators look upon the filing room as one of the most important parts of the mill, because the various machines in the mill employed for sawing, planing, etc., depend for their efficiency directly upon the expertness of the filer in turn upon the equipment provided for such fitting. If you are the operator of a wood working plant it will be worth your while to look into this end of your business and determine whether your saws and knives are being fitted in the best possible fashion. You cannot afford to have any of your machines long idle waiting on the changing of saws or knives, if such change is due to faulty fitting. All of the operators of a woodworking plant bear more or less close relation to each other and it is easily possible for a waste in time due to poorly fitted saws or knives to represent an expense that cuts a good deal of figure in the profit and loss account at the end of the year.

The Price of Veneer

By D. Williamson

The principal difficulty you will encounter when you undertake to compare the value of veneer with the value of lumber will be to establish a basis of comparative cost. We mean to say that the production of veneer is so radically different in all its details that a comparison of its cost with the cost of lumber is almost or quite futile. Te be sure, they are both produced from the same kind of trees, but the differences between them begin at the stump. Veneer logs are selected logs, and only one of several would be accepted by the saw mill would do for the veneers. Therefore, the saw mill can work up everything in the forest except the roots, while the veneer mill must leave 50 per cent. of the forest or utilize it in some other way. For this reason a discussion of the question proposed resolves itself into a resume of the differences between the method of production of veneer on the one hand and the method of production of lumber on the other. For it must be understood in the outset that the comparative cost of veneer and lumber must be considered primarily and the selling price as a resultant.

Now, the saw mill goes to the timber. Usually the timber is first procured and the saw mill located where the logs can be most economically mobilized.

There is no necessity for securing orders in advance of operation—the products are standard. There is little cutting to specifications; the grading is done after the timber is cut and ready to be prepared for the market. Every log is cut into lumber as it comes to the mill. The results are that the timber used by a saw mill is procured at lowest possible cost—there is no selection and no freight—while the processes of manufacture are uninterrupted and the products are guided by a knowledge of what the market demands.

Not so with the veneer mill. There is little or no advantage in locating near the timber; logs must be selected for veneer logs and collected from every direction, leaving out the poor and unfit logs and accepting only prime, suitable logs for the purpose in view. No logs are too good; the best are the cheapest, and consequently the cost is increased proportionately. Some saw mills sell their best logs to veneer mills for more money than they would bring if sawn into lumber.

It follows that the cost of veneer logs greatly exceeds the cost of saw logs. There are some exceptions to this statement, but they only prove the rule. Havinp paid more for logs and paid a considerable freight tariff because the mill cannot belocated near to the timber like the saw mill, does the veneer mill then find that it has an easier proposition than the saw mill? By no means. The mill cannot proceed to turn out veneer to be marketed (except possibly in the case of quartered oak veneers). It must proceed to "secure orders." It must await the pleasure of the consumer. There is no steady, uninterrupted product. The orders are often small, and specifications are strict, delays are innumerable and costly. Deliveries are wanted in short order. The buyer writes: "If you cannot ship our bill in ten days we will order elsewhere. The stock must be dry and free from knots, splits and other defects. Your grading rules cannot apply, as we require this for a job that will not admit of defects. Other mills will furnish it the way we want it. We wish to favor you with the order, but the stock must be equal to what we have been getting from others. Now, give us a good lot of veneers and we will send you our business. Other people are clamoring for it, but we think you can take care of our wants, and we want to get started with you."

Almost the entire business of the veneer mill is made up of just such exasperating orders. Logs of every variety must be kept on hand, ready to pop into the vat and cut the next day, so that orders sent out too late by neglect or oversight can be filled in a hurry and shipped "rushed." But this does not give the veneer mill steady, continuous work. It makes the operations spasmodic and its system desultory.

It will be seen that the saw mill has immense advantages in the lower cost of timber and in the character of its orders; but the greatest gain is in the output per thousand feet of logs. Strange as it may seem, the advantages are altogether with the saw mill in this particular. The lumber output of logs averaging eighteen inches in diameter is said to be from 15 to 25 per cent. in excess of Scribner's measure. The veneer mill cannot get 100 per cent. product of any class of logs unless the orders will admit of a large number of defects. On the contrary, although the logs have been selected and are of extra good quality over the logs used by the saw mill, and cost 50 per cent. more, the veneer man must allow from 25 to 40 per cent. for the waste right in the beginning. If he declines to allow this he will be brought up with a sudden jar when he comes to fill his order.

For the reasons now given, it is perfectly clear that there is no even proportion between the cost of veneer and the cost of lumber. We cannot say ¼-inch rotary cut poplar costs one-fourth as much as 4—4 poplar lumber, nor is there and relation between the two. It is an ancient fallacy that in cutting lumber with a knife a large saving is ecected. The truth is, the product is very much more expensive than the product of the saw.

Comparisons are really of no value. They are misleading to a great degree, and have brought many a man to grief. Sometimes the veneer man will befool himself into figuring veneer from a lumber standpoint, and he begins to wonder why he isn't rich. Always the prospective riches in the veneer business dazzle and deceive the beginner into making investments from which he is not likely ever to see any adequate returns, and it is all because of the rosy hues of the comparisons made between veneer and lumber.

The great reason for the poverty of the veneer business compared with the lumber business is that the former is restricted to such small and feeble operations, such petty and exacting orders, for the most part, and such unorganized trade conditions, that it is comparable to no other business at all.

Lumber, on the contrary, is manufactured generally in a large way. Enormous investments are made, immense tracts of timber are purchased, mills the located in or near the supply. It is no experiment. Men have the courage of their convictions, and it becomes a matter of enterprise. Operations are of stupendous magnitude, production is forced irrespective of sales. There is no hesitation—no doubt. It is known that the products will find a market in good time. They are staple and the quantity consumed is unlimited. The production is not hampered with consideration of the buyers' whims or foibles. The industry is organized; grades are established and inspection is above question. Prices may fluctuate, but the manufacture goes on from year to year, unaffected, and values find a perfect level without restricting production.

The purpose of this association is to collect the forces of the infant industry of veneer manufacture and coalesce them into a tangible organization. Its object is to raise the standards of its operators; persuade them to a rigid investigation of their methods and cost; get them to put prices on their products that are commensurate with the cost of production, and then induce them to stiffen up their backbones and stand for what is right and fair, as a compensation for honest work.

Messrs. Eadie-Douglas, Limited, dealers in building, mechanical, steam supplies and specialties, 12-14 University street, Montreal, have issued an attractive condensed catalogue, regarding a number of the products which they handle. The catalogue is in the form of a neat booklet containing a brief description of the principal mechanical, and building lines carried by the company. In the line of machinery and shop equipment the company can quote on cranes of all descriptions, woodworking machinery, and general shop equipment. Experienced machinery men are in charge of this department. Catalogues and full information will be sent by the company on request. Eadie-Douglas, Limited, have branch offices in Toronto, at 65 Victoria street; in Ottawa, at 198 Queen street, and in Winnipeg, at 445 Main street.

The Great Lakes Lumber Company, Limited, of Owen Sound, whose mills are located on Manitoulin Island, report that they have almost completed their season's cut of hardwood, amounting to between 1,500,000 feet and 2,000,000 feet of birch, elm, oak and basswood. The company erected a new mill with one circular saw last fall, which they report is giving excellent satisfaction. They report that trade conditions are very encouraging. Two good cargoes were recently shipped to Owen Sound factories, one being of pine and the other or hardwood. They report that upon the Island of Manitoulin they secure a good grade of second growth pine which is very little affected by sap. At their Gore Bay mill the company have a lath mill and expect to be cutting lath in the near future. They will also turn out about 30,000 ties, and posts this year.

Can Terms of Sale be Enforced?

When I sell a bill of material and the customer asks for time, I tell him I expect a settlement within sixty days. If it isn't settled by that time, go after him to collect it and in the majority of cases get it shortly after. Whenever an account runs over time a few weeks and the customer settles I don't have nerve enough to charge interest. I suppose some may say that I am too easy, and possibly I am.

There are two sides to this question, as there are to nearly all questions, and much to be said on both sides.

The most of us have on our bills and statements the words "Terms Cash. Interest charged after 60 days." Do we really mean that or is it a mere form and habit we have? If we meant it why don't we enforce it? Can't we do it? It depends a good deal on our community whether we can enforce them or not. If our customers are slipshod, easy-going, pay-when-they-get-ready kind, it is a very hard thing to enforce the terms of sale. Some of them may get angry when they receive the monthly statements and swear they will quit trading with us. But keep sending them just the same and they will soon learn that it is good business methods to send them and will also learn that we expect the account to be settled when due and as soon as they learn that, they will be more prompt in settling. If they go to the bank and borrow some money for 60 days, they know it will have to be paid and expect to pay it when it is due, and the sooner we make them understand that they will have to treat us the same way, the better it will be for us.

Some of the farmers are the hardest people to teach that they must settle more promptly. They can't see why the merchant is in such a hurry for his money. He says the merchant doesn't need to get scared that he won't get it, for he has a good farm, well-stocked, and money in the bank, and if he settles once or twice a year that should be satisfactory. I heard a little incident recently that illustrates this. A farmer had owed the lumberman about $100 for six or seven months. The lumberman met him one day and told him he would like to have him settle as he was getting in some new stock and would have to borrow to pay for it. The farmer, always shrewd and keen to drive a bargain, said, "How much do you need? I'll lend it to you and you won't need to go to the bank." Not all the farmers are in this class I'm glad to say. Some of them are just as good business men and as prompt pay as some of us merchants. They expect the statements and count on settling when they receive them.

Occasionally circumstances are such that it is not the best policy to strictly enforce the terms of sale. For instance, a small contractor, a painter or cement worker, who hasn't any capital to begin with but who is absolutely honest. He gets the material and expects to pay for it upon the completion of the job. He is taken sick or has considerable sickness in his family, and is unable to complete the job as soon as expected and it takes what ready cash he has for medicines. He is unable to pay the dealer within the 60 days and wants more time. Rather than lose his patronage the dealer grants his request. Some may say, "Well, charge him interest." Wouldn't it be a small, measly trick to charge a man under such circumstances a dollar or two interest?

It is altogether different in the wholesale way. That is business man dealing with business man. When the stock arrives the retailer either has the money in the bank or gets it and pays promptly, the most of them taking advantage of the discount.

I tell you, in theory it may be easy enough for retailers to enforce the terms of sale but when it comes down to the practical side of it, it is a different proposition.

An incident in connection with the drowning of a member of the river crew of a California lumber company a few weeks ago, proves that among the apparently coarse river men there is a tie of friendship and loyalty that is, perhaps, not found in any other vocation.

When the body was found it was many miles away from the travelled thoroughfare. The coroner had selected a rough pine box and buried the body alongside the river from where it had been taken.

The comrades of the dead man, who, by the way, was a comparative stranger to them, having joined the crew but a few days before, hearing of the discovery of the body, quit work and walked a distance of 20 miles to the spot where the body of their comrade lay. Then sent back to town for an undertaker, who came with a hearse and handsome casket, and after securing the services of a travelling preacher the funeral was conducted in the most approved manner and the body laid at rest beneath the spreading branches of an oak tree.

The river jacks lost four days' work and dug down into their pockets and defrayed the expenses of the funeral of their comrade and stood with bared heads beside the open grave as the pastor offered up prayer, and not a dry eye was there in that assemblage of rough looking but whole-hearted river men as the clods that covered the casket were lowered by one of their number.

WANTED & FOR SALE DEPARTMENT

PUBLISHERS' NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line ($2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

WANTED—LUMBER, ETC.

Wanted to Buy—Ash, Elm, Birch and Basswood, either Log Run or on grades, Fred. T. Smith, 310 Board of Trade Bldg., Montreal. 11-tf.

Axles Wanted

Wanted to buy wagon axles. Jackson Wagon Company, Limited, St. George, Ontario. 12-13

White Pine to Order

Wanted to correspond with parties able to cut White Pine to order. H. V. Berry, Fort Plain, N. Y. 12-13

Lumber Wanted

Have you any stock which you wish to sell? If so, make the fact known to probable buyers by placing an advertisement in the Wanted and For Sale Department. Address Canada Lumberman, Toronto.

Tank Lumber Wanted

We require 2-in. and 3-in. Tank White Pine, 6-in., 7-in., 8-in. and 10-in.; 10 ft. to 24 ft. Also red pine. Highest prices for Pump Squares. Ontario Wind Engine & Pump Co., Ltd., Toronto, Ont. 7-tf.

Wanted—Ash, Elm and Oak

Wanted to purchase, for export shipment, Ash, Elm and Oak. Kindly state price and point of shipment. Address, with full particulars, Robert Cox & Company, Hope Building Ottawa, Ont. 9-12

To Lumbermen and Exporters

A British Timber Company is open to purchase in large or small parcels all qualities of sawn Pine timber, deals, boards and scantlings and will be glad to negotiate with holders of such stocks for immediate shipment. Apply in first instance to "Timber" care T. B. Browne, Limited, 163 Queen Victoria Street, London, Eng. 12-12

FOR SALE—LUMBER, ETC.

For Sale

Product of two million feet of good white pine logs, rail or water shipment from Bruce Mines. Apply Bruce Mines Saw Mill Company, Limited, Bruce Mines, Ont. 11-14

For Sale

One car 1-in. C. & B. Black Ash.

One car 2-in. 1 and 2 Basswood.

One car 2-in. 1 and 2 Plain Red Oak.

One car 1½-in. 1 and 2, 10 and up wide Plain Red Oak.

One car 1-in. Qtd. White Oak Strips.

This stock is eighteen months on sticks.

25 M. ft. 1-in. to 2-in. African and Tobasco Mahogany, very wide and three years on sticks. Phone or write for prices.

THE JOHNSTON LUMBER CO.,
12-12 Toronto, Ont.

Shingles for Sale

For Sale—Three cars XX, 16-inch sound butt cedar shingles. Prompt shipment. Write Gull River Lumber Company, Limited, Lindsay, Ont. 11-12

For Sale

4 cars 1-in. Ash, No. 1 C. and B.
2 cars 1¼-in. Ash, No. 1. C. and B.
6 cars 1½-in. Ash, No. 1. C. and B.
4 cars 2-in. Ash, No. 1. C. and B.
6,000 Cedar Telegraph Poles, 30 to 50 ft.

GEO. C. GOODFELLOW, Montreal.

For Sale
Hardwood and Hemlock

If you want to buy Hardwood or Hemlock or Ties, Posts and Shingles, visit limits and make an early contract. Pay as work progresses. Can get you 5 or 10 million feet of each on Georgian Bay. Box 266, Canada Lumberman. 9-16

FOR SALE
For Immediate Shipment

2 cars extra choice 6-4 Highland Soft Elm.
3 cars 4-4 White Basswood.
1 car 3-in. Hard Maple.
1 car 4-in. Hard Maple.
1 car 5-4 Soft Maple, extra wide.
1 car Cedar posts, 5-in. top and up.
4 cars Cedar posts, 4½-in. top and up.
200,000 ft. 2-in. Hemlock, Dry.

New and Second Hand Machinery For Sale
AT HUNTSVILLE

One Northy (secondhand) "Duplex" Steam Pump, 3½ x 2½ x 4.

One secondhand Circular Saw Grinder "Colville Patent," good as new, built by The Wm. Hamilton Company, Peterboro.

One secondhand Upright Boiler, engine attached, 20 h.p. Boiler tested to 160 lbs. C. W. pressure.

One Steam Oil Separator, 8-in. pipe. McEachren make.

One Iron Saw Frame and Mandrel complete with pulleys and third bearing. Steel Mandrel, 3 7-16 diam. Watrous make.

One Dry Kiln in four bands of pipe. Steel jacketed with 5 ft. Fan Shaft. Bearings and Pulley. Back pressure valve and steam trap. Over 4,500 ft. lin. piping in the four banks in addition to bases.

One new three saw Edger. Steel Mandrel 2 7-16, with three bearings open end, for 16-in. saws, including Table Rollers and Shifter Irons.

THE HUNTSVILLE SYNDICATE,
11-14 Huntsville, Ont.

FOR SALE

Small Band Sawmill, Waterous make, complete with filing room tools. and Gang Edger, Live Rolls, Slab Slasher, Shingle Machinery, Shafting Gearing, Etc., also, Dynamo and Motor. Also a large number of factory Machines, comprising Matchers, Moulder, Band Rip Saw, Variety Saw, End Matcher. Shafting, Belting. Shaving Exhauster and Pipes, Dry Kiln with Steel Cars, Engine and Boiler, Etc.
2-tf. JOHN FINDLAY, Owen Sound.

WANTED—EMPLOYEES

Advertisements under this Heading two cents a word per insertion. Minimum charge 50 cents

Wanted

By wholesale lumber office, bookkeeper, and all-round man. Must have experience. Apply Box 286, Canada Lumberman & Woodworker, Toronto, Ont. 12-13

WANTED—Good man with Portable Saw Mill to cut out one million feet. Commence September 1st. Can give several years contract. Money advanced as work progresses. Apply Box 275, Canada Lumberman, Toronto, Ont. 11-14

WANTED—EMPLOYMENT

Advertisements under this heading one cent a word per insertion. Box No. ten cents extra. Minimum charge 25 cents

If you want an employee for any branch of the lumber or woodworking trade the best, quickest and cheapest way to get him is by placing an advertisement on this page. Canada Lumberman and Woodworker, Toronto, Ont.

Position Wanted

Position as salesman with manufacturing company by young man of ten years' experience in wholesale and manufacturing lumber business. Four years as travelling salesman. At present employed but desirous of changing. Box 280 Canada Lumberman & Woodworker, Toronto, Ont. 12-13

BUSINESS OPPORTUNITIES

Man with shingle mill and timber wants competent partner with small capital. Box 70, Thessalon, Ont. 11-14

For Sale

Saw Mill of 30 to 35 M. feet daily capacity, complete with engine, two boilers and lath machinery. For particulars write to E. D. Croden, Box 596, North Bay, Ont. 3-tf.

Sash and Door Factory

Partner wanted with $5,000 to $10,000. Practical man to take full charge or will sell on easy terms. Apply Box 259, Canada Lumberman, Toronto, Ont. 7-12

FOR SALE—Saw mill, live rollers, Belt wheel 10 inch by 18 inch, Brown engine, 110 horse power, 13 ft. x 30 ft., also hoop machine and coiler, cost $500. Apply Vendor's Solicitors,

MESSRS. IVEY & DROMGOLE,
12-12 London, Ontario.

Timber Limits For Sale

Can be quickly and profitably disposed of by advertising them on this page. This is where buyers of timber property look for opportunities to invest, if your "ad" is here the investor will see it. Canada Lumberman, Toronto, Ont. tf.

Timber and Land Investment

Farm of three hundred acres within 35 miles of Toronto—one hundred acres of which is timber land—Pine, red and white Oak, Maple, Beech, Basswood, etc. Balance of farm is under cultivation, thirteen acres bearing apple orchard. Buildings cost over five thousand. Price, $29,000. Box 160, Canada Lumberman, Toronto, Ont, t.f.

TO RENT—In City of Ottawa, large retail Lumber Business. Yards, Planing Mill, Factory. Complete old established and going concern. Will consider selling. Reason will be given to genuine enquirer. Inspection and thorough details cheerfully given. Write Box 281, Canada Lumberman, Toronto, Ont. 12-12

Representative Wanted

United States firm manufacturing saw and lath mill and special machinery desires to secure Canadian representatives. Can put right firms in touch with a lot of prospective buyers in Canada. Apply to Box 285, Canada Lumberman, Toronto, Ont. 12-13

British Columbia

SAW MILL, TIMBER LANDS, MINING PROPERTIES, ETC.

Saw and planing mill, capacity 30 M. in 10 hours; six thousand acres timber, 70 million feet; mill and timber $70,000. Farm with good residences with cattle, hogs and poultry, 3,000 acres freehold land; $30,000. A responsible purchaser with about $25,000 cash can handle this, balance of payments spread a period of 10 years, or more if desired.

Also several mining properties, iron silver, gold and lead, on half share for development work.

Saw and planing mill, capacity 40 M. in 10 hours, splendid situation, rail and water transportation. Mill and plant with several good residences and fruit orchard, price $60,000. 10,000 acres virgin timber lands, estimated to contain over 100 million feet, price $50,000.

Terms—$30,000 cash, balance in easy instalments. Owner retiring from business. Apply Box 258, Canada Lumberman, Toronto, Ont. 7-12

MISCELLANEOUS

A Valuable Timber Limit for Sale

Timber Berth 1199, containing about one hundred million feet, principally spruce, of a very superior quality, well situated for economic handling. A railroad is under construction which will pass within one mile of this limit. There is big money in this proposition for the right party. Easy terms for payment. For further particulars apply to Room 1, Archibald Building, Edmonton, Alta. 10-13

FLEXIBLE SHAFTING IN WOODWORKING SHOPS

A British firm is responsible for the application of flexible shafting to the woodworking trades, such as coach and motor car building, cabinet making, furniture, etc. The equipment can be easily modified to suit the particular requirements of any woodworking trade where rapid boring and screw turning are essential. The process is quite simple. The mechanism is complete in itself and can be driven from any existing shaft or can be made portable. The essential part consists of three flexible shafts driven from one central gear wheel, though the number of these shafts can be increased as desired. It is claimed that with one of these equipments a man can accomplish ten times the work he can do by hand.

Electric Cranes for Sawmills

The duty of a crane in a sawmill o rtimber yard being intermittent, experience teaches that the best crane for this work is an overhead electric travelling one, which can be arranged to run right through the mill and timber yard. The chief advantages of an electric crane are that the power is always ready when wanted, and can be immediately switched off when done with; at the same time it is rapid in action and very convenient in use. A considerable variety of arrangements are in use, but speaking generally, no apparatus gives better results than a multi-motor system in which each of the motions is worked by a separate reversible motor. The first cost may be a little higher than some other arrangements, but the result in working is generally more econimocal and satisfactory. In many cases it would pay to buy current from a public supply to work a crane where it would not be economical to drive the whole mill electrically.

If saws are very "slack" or "tight" centred they should be re-hammered, but if only slightly so the trouble may be often got over by packing them in a particular way. If the saw is slack centred the packing should be placed as near the centre as it is possible to get it, and carried from there to, say, within two inches of the gullet, taking care not to pack one side of the saw tighter than the other, or the saw will be thrown out of true. The packing should be a little tighter on each side, close to the centre, than at each end, so as to create a little warmth, and to produce equal temperature throughout the saw. The best kind of packing to use is plaited spun yarn, of the required thickness between the plate and the saw. The tight-centred saw must be packed near the teeth with spun yarn or pegs; if the latter are used, a straight-edge will be required, and the pegs should be set, say, about 1½ inches from the bottom of the gullet. Then take the straight-edge, place it on the face of the washer on saw spindle, and ascertain that the pegs and the washer are perfectly parallel. The two back pegs may be left a little slack so as to give freedom to the saw.

Review of Current Trade Conditions

Ontario

While the lumber trade in Ontario has perhaps been rather quiet during the past fortnight, this has probably been only a temporary experience, due to the fact that a good many yards are just winding up their early orders, and are getting shaped around for the usual midsummer trade. Trade conditions at present are at an apparently intermediate stage. On the whole, business has been very good and most of the wholesale firms are well satisfied with their trade. So far as Toronto is concerned, conditions point strongly to good trade throughout the rest of the year. Manufacturing firms in Northern Ontario, with few exceptions, report that their stocks have never been more closely sold than they are to-day. This applies perhaps more strongly to the Georgian Bay, and Ottawa Valley mills, than to those on the north shore. North shore manufacturers report that their trade with the United States (which constitutes the far greater part of their business) is badly upset by the political and business conditions prevailing on the other side of the border. For this reason several of these mills are seriously considering the advisability of directing their attention to the Ontario trade.

The demand for lath in Ontario is good, and stocks are closely sold up. One large manufacturer reports that many of the mills are practically shipping green lath. There is quite an active demand for Norway, which is being substantiated for white pine for many purposes, such as flooring, trim, etc. Spruce is in better shape than it was earlier in the year. The only real feature of the trade to-day is the improvement in the demand for the low end generally which is in a much better position than it was a year ago.

Medium grades of lumber continue slow, a fact which is reflected in the improved demand for norway and spruce.

Referring to the outlook, a large manufacturer reports that in his opinion the trade is in for a "cracking good fall trade," because it looks as if business is clearing up on the other side of the line. As soon as they begin to improve on the other side, the effect is sure to be felt in Ontario instanter.

A prominent firm of wholesalers in Toronto report the local trade in splendid condition, but find the outside trade throughout the province rather quiet. Their trade with the United States is dull, but they believe they see signs of improvement. Shingles, they report very quiet, on account of an anticipated over-production.

Eastern Canada

Many of the mills in the province of Quebec were about two or three weeks late in starting up this year. The difficulty in getting out logs, on account of low water, was the principal cause of the delay. In the back country, however, rain came about two weeks ago, just in time to help in bringing out the logs. Cool weather, which followed the rain, assisted in maintaining the higher water and most of the logs have now been got out. The mills lost no time in getting to work as soon as the logs commenced to arrive, and the prospects for a good season's business are now encouraging. The Montreal trade is fairly brisk. There is a scarcity of two-inch spruce and the demand for one-inch cull spruce is good. The building trade in Montreal is quite active, a lot of large buildings being under way. Shingles have been advancing in price for some time. Lower grades of lumber are scarcer and the price of culls is stiffening. Good lumber is also scarce and high in price with a tendency toward higher prices. Stocks of good grades are reported scarce.

The lath situation is encouraging. A well-known lumberman, speaking of lath, says, that in his experience he never knew them to be so nearly sold up to the saw before. As a result he believes that there will be no surplus of lath this year and that prices will remain firm throughout the year. At present, lath are quiet as the building demand does not become extensive until early in July.

The export trade is very fair to the old country. Trade with South America is also good, but business with the United States is poor. Enquiries from the United States, however, are a little more numerous.

Reports from Fredericton state that most of the St. John River drives were got out safely into the main river during the last weeks of May. Bank logs on sale then were quoted at $10.50 to $11 for batts and $13.40 to $14 for merchantable.

Frames of eastern spruce, 9 inch and under, are selling at Boston at $23.50. The demand for covering boards is rather small. Random is moving in small lots. There is a fairly firm market for hemlock, but the demand is light. Eastern clipped boards with frames sell at about $20, but this price is not secured for carload lots, which have been going at about $19.50. Most buyers will not offer more than $19. Shingles are firm at Boston. Choice cedar extras have been sold at $3.60, though not many buyers are paying this price. Quite a good volume of business is occurring at $3.50. The market still contains some cedar extras which can be secured at $3.40. Clears are firmer and in better demand. The demand for lath is moderate. The price of 1½ inch ranges from $3.65 to $3.75, and for 1⅝ inch from $3.70 to $3.75.

Western Canada

The demand from the Prairie provinces, for common finish and timbers is good, but has not been quite up to the expectations which were formed during the early spring months. Peculiar weather conditions have had something to do with this situation, as the usual building operations were held back. The large amount of lumber marketed at prairie points, by Washington mills has interferred with the demand. Coast and mountain mills have been shading their prices a little in order to meet this competition.

Trade conditions in the Western states show little improvement. An encouraging sign, however, is afforded by the tendency of manufacturers to agree upon a policy of curtailment. It is believed that the banks have had something to do with this movement. Most of the interior mills in British Columbia were about a month late in starting up. It is expected that this will have a beneficial effect upon the demand. While the plants were idle, shipments continued actively, and stocks on hand were reduced considerably. Building operations in Vancouver and its vicinity continue very active, so that there is a good demand for interior finish and timbers.

Great Britain

At Liverpool, spruce continues in good demand, and prices are very firm. Stocks the unusually low, and some sizes are now exhausted. Sizes 3 x 12, 2½ x 7 and thereabouts, have been inquired for, and anything of the sort offering is readily taken at current prices. The first arrivals of the new Canadian goods are to hand and, as regards spruce, will find an appreciative market. Birch continues in short supply at Liverpool, stocks of planks and logs being practically exhausted, and the demand for this wood in any usable form being active. Prices have accordingly hardened. In pitch pine a very fair demand for sawn wood exists. Planks are also in good demand, but hewn wood has been quiet. Prices remain steady and without quotable change.

At Hull, the sales of timber have been more numerous, and the state of the timber trade generally, has improved. Yard stocks have been worked down, and a better tone prevails in the trade.

At West Hartlepool an improvement in the building trade of the district has had a good effect on the timber trade, and builders' timber is moving more freely.

On the Tyne, the shipbuilding industry is now actively employed and more demands are being made for timber. Sawn goods are in better request. Deck deals, flooring boards, house-fitting timber, and plank stuff are all selling more freely.

At Manchester a slight improvement in the demand for builders' wood is in progress. The engineering and cotton working industries are more actively employed, and have helped to stimulate business in the timber market. Spruce and pine deals are still in short supply, and a very fair demand for these exists. A steady movement of sawn pitch pine, and of planks is in progress, but hewn wood is neglected. Stocks of birch are in small compass and a very fair consumption of this wood is in progress.

United States Current Trade

Chicago.—The lumber trade in Chicago continues to be seriously disturbed by the labor troubles prevalent in that city. Building permits have decreased considerably. The demand for the upper grades of northern pine has been fair during the past fortnight and also the demand for No. 1 and 2 common. Some wholesalers report that they have sold considerable quantities of No. 3, but others report that this grade is weaker. Nos. 4 and 5 have been moving along steadily at fair prices. There is not a particularly heavy demand for hardwoods, but trade is steady and fairly active. Plain sawed oak is steady and rather scarce. Quarter sawed white oak is inclined oak is in good demand. Northern stock is unchanged. The demand to be easier. Quartered red oak is steady, but quiet. Common plain for birch and maple is increasing.

A healthy demand continues for hemlock, and manufacturers are holding prices firmly as stocks are rather broken. The firmness in yellow pine is assisting the hemlock situation. Manufactur-

E. C. Barre, Assistant Manager

ers of southern pine are holding firmly for present prices and reports of trade outside of Chicago are rather encouraging.

Shingles are nominal at $3.12 for clears and $2.64 for stars; some sales are reported at slightly lower quotations. There is a fair demand for white cedars at about $3.10 for extras. Lath are steady and in good demand.

Buffalo.—There has been some improvement in the northern pine trade of late and the demand for building lumber is normal. Stocks have improved in appearance since the opening of navigation. Prices are well maintained, with high figures, for the upper grades, on account of their scarcity. The box trade shows signs of improvement.

The hardwood business is quiet but prices in the upper grades remain firm. Lower grades are selling slowly at unsatisfactory prices. Maple and birch are in the best demand and there is a fair trade in plain and quartered oak.

A little better demand is reported for hemlock, with prices firmer. Yellow pine prices continue to show firmness, as the result, it is said, of the policy of curtailment followed by the southern mills. Prices of shingles and lath are unchanged.

New York.—The demand for northern pine is light and prices are irregular. Hardwoods are stronger than any other line. Prices for ash, birch and maple are well maintained and the same applies to plain and quartered oak. Southern pine is dull and stocks are plentiful.

Market Correspondence

Definite Improvement in United Kingdom Trade

Liverpool, June.—A slight but definite improvement in the state of the timber trade in the United Kingdom has taken place since the middle of May. In London the state of the trade is abnormal owing to the demand for lumber and log stuff of the lighter kind, for coronation structures. In view of this demand, which is very active at the time of writing, it is difficult to tell exactly how the regular consumptive demand, apart from requirements on coronation account, stands at the present time. One can speak with certainty as to the condition of trade in the more important timber using industries of the London district. If production is active in these, then it is certain that the consumption of timber within them is proceeding satisfactorily, though as some of the timber will be drawn from private stocks, in hand, merchants' stocks may not show any decrease, until the private stocks are worked off. With respect to the building trade, it may be said that in this the consumption of timber is more active than it was three or four weeks ago. The improvement in this industry in the London district has not been great, but there has certainly been an improvement. The demand comes chiefly from builders of property of the new, picturesque cottage class, and as regards the kinds of timber wanted, this depends entirely on the stage at which the erecting or fitting of the property stands. If it be at the roofing stage, spruce scantling to carry the slates, 4 in. x 3 in. or 3 4 in. x 2 in. or 3 in. x 3 in., as may be, wall plates of 4 in. x 3 in. or 2 ins.; and purlines of 6 in. or 7 in. x 4 in. or 3 in., according to the conditions of the work; these last of spruce or red pine, will be used. If it be at the flooring stage, joists of spruce or red pine will be used to carry weight, and tongued and grooved flooring boards. If the work be at the fitting stage, window frames, sashes and staircases will have been made at the builder's shop, so will only have to be fixed in position at the buildings. For these fittings, 2 in., 1½ in.and 1 in., yellow pine will be used chiefly, and skirtings of probably 9 in. x 1 in. For cupboards, shelves and doors, yellow pine will be used, 1½ in. or 1 in. thick, and of widths according to plans. Handrails, as required, will want chiefly, mahogany of about 3½ in. x 2½ in.,or oak 3 in. x 2 in., mahogany being most used. Ballusters of 1¼ in. square, or thereabouts; of yellow pine, commonly, are psed in the better class of cottage property. Slating battens, 1½ in. x ½ in., and some lighter joists, of about 7 in. by 3 in. or 2 in., will also be used to some extent. Building timber of such kinds is now in fair demand in the London area.

Case and Box Making

Packing case makers are busy, and are taking chiefly 1 in. and ¾ in. spruce boards, of ordinary widths. This branch of industry is steadily growing in importance and is making large and well sustained demands for spruce, not only in London but in most of the larger towns. Reports from these towns speak of packing case makers being busily employed. The industry is expanding moreover in its heavier, export branch. The increase in the exports of machinery and cotton goods, and in the re-exports of goods received in the United Kingdom from other countries, has made a large additional demand for packing boxes, and materials of the heavier class. The large export, heavy goods' box requires much stronger wood than the ordinary commercial packing case. For end pieces and angle pieces, short lengths of 3 x 3 or 3 x 2 spruce are used. For side and end boarding, the timber will be 1 in., 1¼ in. or 1½ in. spruce 7 in., 9 in. or 11 in. wide. Cross-bands will be freely used, and these will be 1 in. or 1¼ in. spruce, of any of the widths named. A relatively large amount of wood—almost invariably spruce, is used in making a box of this kind, and in wedging up its contents. The demand for such boxes has greatly increased of late, and must continue to increase, while the export and re-export branches of trade in machinery, general hardware, cotton and cloth goods continues to increase.

Another branch of packing case making has also been more actively employed of late, but has hardly affected the general casemakers, who make for trades at large. This is the soap-makers' box branch. An increasing output of soap has gone on in England for some years and both home and export branches of this trade make large demands for wood suitable for boxes to contain the soap. The boxes used are for the most part small, thin and light wood, hemlock, fir or spruce, with a proportion of light batten or "rib" wood, 2 or 2½ x 1 in., being used. Each of the large soap manufactories has its own well-equipped box making departments. These departments are, as a rule, better fitted for making their own special kinds of boxes than the general packing case factories outside, which cater for the commercial world. Box making machinery of the highest efficiency is installed in the soap works box rooms, regardless of cost. Nothing is spared in the planing and fitting up of these rooms, which promises to conduce to a great output of the boxes required, at a minimum cost per box. The wood used for boxes for the home trade is very light, that for the sides being barely ⅜ in. thick, and that for the ends, 7/16, ½, 9/16 or ⅝ in. thick.. The width of the boards varies according to the size and number of the packages which the boxes will have to contain. For the export branch of the trade, from ⅜ to ¾ in. board is used for sides and 1 in. board for ends, and ribwood of 2 in. x ¾ in. or 1 in., as cross-banding to strengthen sides and ends. In general, a large stock of the boards and rib stuff used by soap manufacturing companies, is held by them.

Lumber manufacturers who may be interested in this particular field of consumption, would do well to write to the managers of the companies, saying that they would be willing to quote for supplies of wood required for box-making and asking to be informed of the sizes of the boards used. No class of timber users in the United Kingdom are more keen over getting exactly what they want, and the very last cent of advantage in price when buying, than the large soap-manufacturing companies.

The extent and value of the wood case, crate and box-making industry of the United Kingdom may be seen from a section of the census of production, returns, lately issued. The section in question deals with production and labor in the case and box-making industry. The value of the goods produced in the different branches of the industry, in the year reported on, was as follows:—

Crates, cases and boxes for packing merchandise, including rolling boards for cloth pieces	£2,585,000
Chests and travelling trunks	30,000
Other boxes and cases of wood	145,000
Casks and barrels	14,000
Other wood manufacturers	28,000
Deals, battens, planks, floorings matchboardings, &c.	79,000
Firewood	35,000
Other products	12,000
Total	£2,928,000

The average number of the persons at work in the case and box making industry, on the last Wednesdays of January, April, July and October was 12,459.

Activity Among the North Shore Mills

Thessalon, Ont., June 6.—The mills on the north shore are running, some of them, day and night.

Shipping lumber is now the order of the day, boats loading at all the mills.

The drives are coming down well. There is abundance of water. The drives will come out comparatively cheaply this season.

H. H. Bishop, the lumber king, of Thessalon, was here last week and left for the windy city of Chicago. He says that the Thessalon Lumber Company have sold their entire cut for the season.

Mr. E. B. Foss, of Bay City, left here yesterday for home. Mr. Foss is enthusiastic over reciprocity and says the measure will carry at Washington hands down.—Algoma

Montreal, June 10.—The latest development in connection with the "Wayagamack" Pulp and Paper Company, Limited, is the awarding of the contract for the construction of the mill on Baptist Island,

OWING to the great scarcity and almost prohibitive prices that are prevailing now for nearly all lines of dried Fruit such as Apples, Peaches, Prunes. We look for an exceptional demand for Natural Figs.

Works: Sherbrooke, Que. St. Catharines, Ont.

opposite Three Rivers, to Mr. C. E. Deakin, of Montreal. The mill is described as a 100-ton Kraft paper mill. The first fifty-ton unit is to be ready for operation by October 1, and the second unit, of the same capacity, by spring. The machinery, of course, is a separate contract. Baptist Island is magnificently situated, having a bridge on the north side to the mainland, where there is a convenient siding of the C. P. R. The logs also are received on this side. While the deep water channel traversed by the ocean liners is on the other side.

Logs Coming Out Well in Quebec Province

Montreal, June 10.—Rain came in the back country just in time to keep out the rafts of timber and logs that two weeks ago were being held up by shallow streams. The cool weather that has prevailed most of the time since then has helped to conserve the water supply, and it is now believed that most, if not all, of the logs ready for the mills have been got out. The saw mills have started up and the prospects are very hopeful from the manufacturer's point of view.

River and canal boats are about looking for cargoes of pulpwood. The Whitehall boats come out to the St. Lawrence at Sorel and Charlemagne for their burdens. The Upper Lake boats go farther down the river and load for Oswego and Battle Island, New York.

Montreal merchants, both wholesale and retail, report business very brisk and satisfactory. Two-inch spruce is reported scarce; one-inch cull spruce is in brisk demand. The American market is sending over inquiries for certain grades of lath. The local market for lath is slow yet as this line does not move much until the end of June or early in July. Wholesale dealers give quotations of No. 2 spruce delivered by rail at $3.55 per thousand pieces.

Quebec Measurements Show Increase

The following comparative statement of timber, measured and culled to date, is furnished by the Supervisor of Cullers' Office, Quebec, under date of June 6:—

	1909 Cubic Feet	1910 Cubic Feet	1911 Cubic Feet
Waney White Pine	184,160	154,280	307,240
White Pine	27,520	8,880	....
Red Pine	200	......	6,240
Oak	34,600	36,120	760
Elm	240	41,280	25,840
Ash	320	160	80
Birch and Maple	45,080	40,680	58,800

Mill Construction and Insurance

The writer of this article wishes to submit to mill owners a few thoughts pertaining to the construction of modern woodworking plants, which he believes will help to lower the running costs of such plants. One of the principal items in the xpense bill of a sawmill plant is that of fire insurance, and anything that would tend towards lowering the rate of that insurance should be of interest to the owners and managers of woodworking plants.

It is a well known fact that the average sawmill or other woodworking plant is a risk that is not sought after, and is sometimes declined by insurance companies being considered a class of business wherein the actual losses may be greater than the profitable profits. If the risk is accepted the premium rate is sometimes so high as to make it practically prohibitive to the millowner.

It is the contention of the writer that the greater part of losses arise in the faulty and defective construction of the mill buildings, and that these losses can be lowered by a slight difference in the style of framing of the buildings of such woodworking plants, or any other plant of timber construction; that is, instead of adhering, as we do at present, to the methods of our good old grandfather's barn style of framing, to adopt that of "modern slow burning mill construction."

Of course, we know that the nearly perfect fireproof building is of reinforced concrete, but owing to the great extra cost of same over lumber it will be some time yet (on the Pacific coast at least) before concrete is used for the construction of woodworking plants to any extent.

The difference of cost between the old-fashioned way of framing and that of modern slow burning mill construction is small, but when we compare the advantages to be gained the extra outlay would not be considered as insuperable. Let us see what benefits are to be secured by modern slow-burning mill construction over the old-fashioned way.

With the old-fashioned way, should a building catch fire, there is nothing to prevent the fire from getting into every hole and corner; the flame wraps itself around timbers, ends of joists, girders, and plates, and the building soon becomes a total loss, while in modern slow-burning mill construction fire has not the same opportunity to spread and is more easily checked.

I cannot do better than to use the words of F. E. Kidder, one of the leading authorities on this continent on building construction and superintendence: "The essential features of mill construction as regards resistance to taking fire and retarding the progress of flames, and also in preventing the building from being destroyed in case a fire gets under headway, are, that all modern construction shall be of large dimensions and so arranged that there will be no space for dirt and dust to collect. The under floor should be of plank and the floor beams and girders should be self-releasing from the walls, and the posts should not depend on the floor beams and girders to keep them in place.

The foregoing paragraph contains the essence of modern slow-burning mill construction, and resolves itself into:—

(a) That the framing of the building shall be of large timbers so arranged that there shall be no space for flames to pass through, and no chance for dirt and dust to collect.

(b) That the girders and floor timbers shall be self-releasing from the walls.

(c) That the posts shall not depend entirely on beams and girders to keep them in place.

Of course, in designing a mill one has a lot of heavy machinery to figure upon, and except in the cases of plants electrically driven, there are the shafting, pulleys, belts, and other gear, to be taken into consideration; still, the same conditions apply to the old way of framing, and it is only the apparent indifference of the average millowner or manager who, although keen enough to get the latest and best in machinery, does not give the very important subject of the framing of the building of his plant the consideration that it is entitled to.

It is not my contention that by changing the style of the framing of the building it will eliminate losses by fire, but only that if the buildings are properly framed the chances of saving the plant from being a total loss will be far greater with modern slow-burning mill construction than with the old-fashioned hay-barn style.

There are many important subjects to be considered in the construction of a sawmill plant, and they are far too numerous and important to be considered here, but the following are a few of the most important.

1. Having well and carefully designed plans of modern slow-burning mill construction;
2. Having the buildings carefully framed and erected according to those plans;
3. A more liberal use of concrete for the foundation of the buildings and machinery;
4. An efficient automatic sprinkler system;
5. Having all dry kilns constructed of concrete and of natural draught moist air system.

The millowners and mill managers will go a long way towards lowering the cost of production by lessening the insurance rate, and thus helping themselves to a larger dividend on their capital invested if some of the above ideas are kept in view when the construction of a mill is being considered.

The Toll of the Tall Timbers

The harvesting of the forest crop is a most interesting sight. The lumbermen's crop is one that has taken from one hundred and fifty to five hundred years to grow. Under foot is a century-old carpet of fragrant pine needles and moss. Through the interwoven branches the sunlight makes its way, weaving fantastic and ever-changing Oriental designs on the forest carpet. It is as though you were in some vast cathedral. The light is dim and mysterious. Two hundred feet above is a roof of almost solid green, supported by a multitude of massive rough-barked columns. By your side rises a Douglas fir, six feet through at the base and straight as an arrow to the first limb, one hundred feet or more above you. The storms of three centuries have but given it added strength, beauty and symmetry. Undisturbed, it will be young when you and your children are old, but its time has come! Compared with its massive strength, the rough-garbed woodsman, who is examining it critically, seems insignificant. He has come to give it its death sentence. He is the "chopper" or "undercutter" and his woodcraft judgment must be of the best. He examines the tree carefully and decides in which direction it shall fall. Where the trees are standing thickly this is sometimes a nice question, because if in its fall it deviates but a few feet from the chosen course, it may lodge against another tree and be hung up, or it may fall across a down tree or a stump and break, thus ruining one or more cuts. When the "chopper" has made his decision, he undercuts the tree and thus determines the direction of its fall.—Fred Lockley, in April Pacific Monthly.

TALK NO. V.

It is absurdly easy

to make a lot of fine resounding assertions about the "AMPHIBIA" Water Proof Belt. Any man with an extensive vocabulary could do that about any weak-knee'd proposition.

But we're out to convince you, so here's a definite offer.

We will send to any responsible firm

ONE "AMPHIBIA" BELT

on trial and if it fails to do as we state, it can be returned and no charge will be made.

Now, advertisers sometimes make offers which have a nice open-handed appearance, but which it would'nt pay them to get accepted.

But our offer, as outlined above, has been accepted and

Not one belt has come back

One customer says that it lasts five times as long as any other belt he has ever used.

Enough to make you think, eh?

Remember, "AMPHIBIA" is waterproof and made from first-class oak leather.

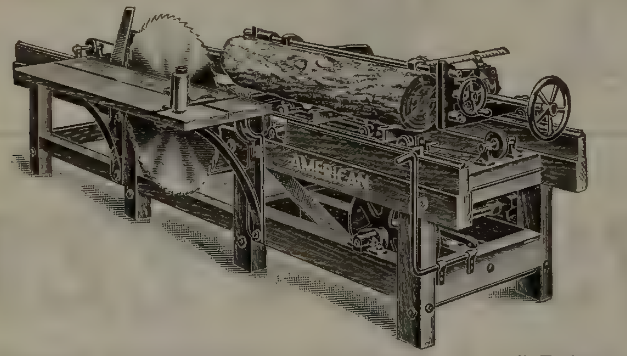
The American "Empire" Bolting Machine

The "Empire" Bolting Machine illustrated herewith is a new device just brought out by the American Saw Mill Machinery Company, of Hackettstown, N. J., which embodies many features of interest. The new machine is the outgrowth of a long experience on the part of its builders and has many important details which mark a distinct advance in this class of machinery.

The "Empire" Bolting machine is meant for all kinds of bolting, short-log, working up veneer cores, sawing out stock for laths, staves, spokes, handles, bobbins, spools, chairs and similar work. It is also adapted for making box boards, pickets, crate slats, and a variety of other small dimension sawing.

There are two head-blocks with steel bases, opening thirteen inches from the saw so that logs up to fifteen inch diameter can be handled.



American Saw Mill Machinery Co.'s "Empire" Bolter.

A gauge roller with graduated base is quickly adjusted and clamped in position for sawing any thickness of material. This permits rapid setting for any cut and insures accurate sawing to the gauge set. The roller is simply swung aside when taking off the first slab from the log.

In the "Empire" Bolter, as in all "American" machines, special care has been exercized to make the actual working time of the machine a large percentage of the total running time. This means a very large capacity per machine.

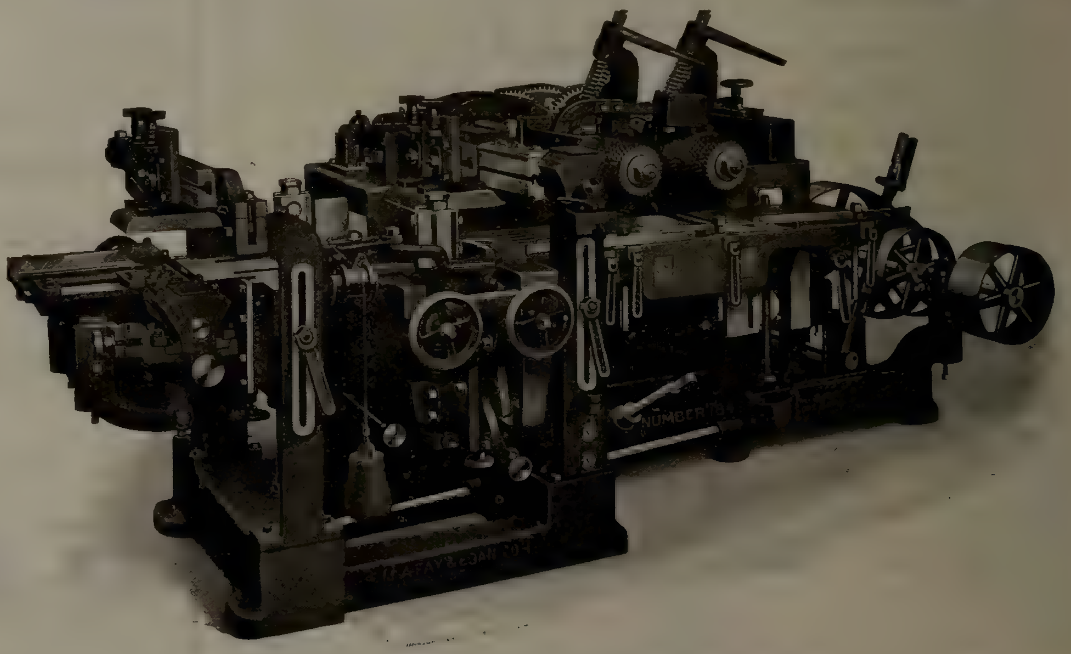
A New Departure in Moulding Machinery

The accompanying illustration shows one of the moulders manufactured by J. A. Fay & Egan Company, Cincinnati, Ohio. The manufacturers have made a specialty of moulding machinery which for years has been recognized as high class throughout the lumber fraternity. They have made a careful and exhaustive study of the needs of their customers, and keep in continual touch with the results obtained from their machines so as to know how to improve them where it is found possible or desirable.

The illustration shows the latest model of the Fay & Egan No. 184 heavy moulder, to work stock 12 in. or 14 in. wide. Special attention is called by the manufacturers to the base of this machine, the sole plate being cast extra heavy in one piece and extended to form an outer bearing for the upper head and to eliminate excessive overhang in the lower head. The entire construction of the machine is massive. Good belt length is provided but at the same time it is very compact.

Eight rates of feed are provided, all under control of the operator from either end of the machine. Other features are the angle clamp boxes, which eliminate shut downs for babbitting; its wide open construction, the end platen, pressure bars and chip breakers all swinging back to give easy access to the heads; angle and cross adjustments for both side heads made from operating side of machine; extremely heavy gearing, the lower gears being the full width of the upper ones; adjustable post to outside bearing which is detachable; spring pressures to feed rolls, eliminating the cumbersome weights; countershaft on the machine and adjustable vertically and laterally; adjustable idler to upper head belts, outer side head, matcher clip and fence adjust laterally as a unit; powerful and positive feed; screws for raising and lowering the bed mounted on ball bearings; vertical and lateral adjustment to lower head.

Particulars of these and many other features in the construction of this machine will be sent, together with large illustration, upon application to J. A. Fay & Egan Co., 465-485 W. Front street, Cincinnati, Ohio.



J. A. Fay & Egan Co.'s No. 184 Four Side Moulder.

Securing the Right Man for a Branch Yard

The problem of getting the right men in the positions of responsibility is one which has meant the sussess or failure of many a firm and individual. Particularly is this problem a puzzling one in the retail lumber trade. It is a business which, in many cases, is spread over a great deal of ground and the man who runs a branch yard must be more or less independent and apart from the heads of the business.

It is comparatively easy to get men who can follow; it is the man who can lead, who can steer the business ship successfully, that is in demand and whose services are hard to secure. The men in charge of the retail yard must have all the qualifications necessary to success in business in other lines and must possess others with which to cope with peculiar conditions in the lumber trade. He is not required merely to take orders on the telephone or by mail and ship out the goods, he must meet the customers and treat them in such a manner that he can hold his trade in the face of competition from a rival concern that probably has quite as attractive a schedule of prices and quite as desirable a line of goods. The customer, particularly in the smaller places, knows the men not the company. If his manner of conducting the business does not meet with their approval they will go elsewhere to buy without a thought of the loss of business to the company.

The incompetent yard manager or the man who neglects his customers or who proves unreliable in his dealings with them may be the cause of an important loss of business. A trifle may lose a valuable order and business once lost is, like a lost day, never made up. It is a poor kind of economy that prompts the securing of the services of a man for a responsible position on the score of cheapness while he may lack the other necessary personal qualifications to successfully cope with the conditions met with. The ability of the man who is to be entrusted with important affairs should be considered first; it is an easy matter for the cheaper men to lose more in actual profits each day than the saving on his salary amounts to in a week.

The Columbia River Company, Limited, has recently made an offer of £600,000 of stock in England. (Part by an issue limited to £1,000,000), 5 per cent. first mortgage debenture stock at 89, guaranteed as to principal and interest by the Canadian Western Lumber Company.

Sweeping charges of a gigantic conspiracy to maintain high prices, to blacklist concerns not regarded as "proper" trade and to violate generally the Sherman anti-trust law, are made in a government suit recently filed by Attorney-General Wickersham in the United States Court against the so-called "lumber trust." Ten trade organizations and more than 150 individuals are named as defendants in this suit, which may be the first of several planned by the Department of Justice against combinations of retailers in staple commodities and the necessaries of life to prevent the ultimate consumer from buying elsewhere except from the local retailers. The government's suit is replete with sensational allegations, and it is asserted that builders and consumers of lumber the country over are at the mercy of the retailers' organizations in different sections of the United States. The suit filed is against the Eastern States Retail Lumber Dealers' Association, which is the central body of nine organizations covering five states, the district of Columbia and the cities of Baltimore and Philadelphia.

EDGINGS

Ontario

Edwin Owen, Richards Landing, Limited, is advertising his sawmill for sale.

The Canadian Woodworkers Limited, Sarnia, Ont., have obtained a charter.

The Canadian Lumber Company Limited, has obtained a charter, at Toronto.

The Chambers Lumber Company, Limited, Rydal Bank, Ont., have obtained a charter.

The Car and Coach Company, of Preston, Ont., have decided to increase their plant by the erection of an additional erecting shop.

Mr. John Stirrett, of Hymers, near Port Arthur, Ont., is considering a plan to establish a sash and door factory in conjunction with his mill at Hymers.

Fire recently destroyed the saw mill of Austin Brothers at Haliburton, Ont. The building and contents were insured. The destruction of the mill will cause a serious disturbance to business as it was enjoying an excellent business, and employing a large staff of men.

The Shevlin-Clarke Company of Fort Frances, Ont., have completed the construction of their sawmill. The new mill is one of the best in the country. The company have a large force of men at work building a new planer and dry shed which will be ready for use shortly.

The sawmills at Pembroke, Ont., are all running and turning out large quantities of lumber daily. The Colonial Lumber Company commenced operations about the middle of May and while not pressing their mill to its utmost capacity at first they cut up between 1,500 and 1,800 logs daily. They expected to increase the force of men when the tows of logs commenced to arrive, and make a capacity cut every day. When operations commence under a full head the force will exceed 200 men. Messrs. Barr, Morris & Supple started the machinery in their mill on the same day as the Colonial mill. The Pembroke Lumber Company commenced the season's operations about the same time.

The largest tract of standing white pine timber in the State of Michigan has been acquired by a trio of Canadians—W. D. Lummis, of Toronto; Henry J. Bartlett, of Orillia, and George Gordon, M.P., of Sturgeon Falls. The transaction, which was a cash one, involved over a million dollars. The property is situated at Sheldrake, Michigan, and was the property of the Calumet and Hecla Copper Mining Company. They decided that the timber was of too high a quality to use in mining purposes, in which way they have been using some thirty million feet per year. The property covers 38,500 acres of timber land, which has been secured in fee simple. A mill cutting between 17,000,000 and 18,000,000 feet a year is included in the purchase A great deal of the timber is large and will be cut into square timber. The new owners will begin operating next fall.

Eastern Canada

C. C. Manuel & Sons, veneer manufacturers, at Sutton, P. Q., have dissolved.

Ouellet & St. Pierre, sash and door manufacturers, Longueuil, P. Q., have registered.

Fournier & Namainville, Lachine, P. Q., sash and door manufacturers, have registered.

Arthur Dupius, lumber dealer, Coaticook, P. Q., held a meeting of his creditors recently.

Larose & Cie, & Richer & Freres, sash and door manufacturers, Montreal, have registered.

A winding-up order has been granted to the Nominingue Pulp Wood Supply Company, Montreal.

The Lawton Saw Company Limited, Montreal, manufacturers of saws, etc., are advertising their plant for sale.

Newcastle, N.B., reports state that several million of logs have been abandoned on the Miramichi for lack of rain. The largest tie-up is that of D. and J. Ritchie Company, on the Sevogle. None of Upper Miramichi drives were yet in safe waters at the end of May.

B. Grier, Limited, is the name of a firm which has been incorporated under Dominion charter to carry on a lumbering and lumber manufacturing business, with headquarters at Montreal. The capital stock of the company is $1,000,000.

Mr. B. C. Howard, of Sherbrooke, Que., sustained a serious loss recently, when between three and four thousand cords of pulp wood was destroyed at the plant siding on the Tring and Megantic branch of the Quebec Central Railway. There was no insurance carried, and the loss will be at least $20,000.

An order for foreclosure and sale of Nepisiguit Lumber Company has been made by Mr. Justice McLeod at St. John, N. B. After the mortgagee, the Adams Burns Lumber Company, is paid a sum sufficient to cover the mortgage, the claims of the lien-holders are to be paid into court and held pending the decision of the court on a special case.

A Fredericton, N. B., despatch under date of June 3 says that the Tobique river is now at a good pitch for driving owing to the recent heavy rains. Donald Fraser & Sons' big drive, which contains about twelve million feet of lumber, was brought out of the Sisson branch and landed at the mouth of the Tobique river in 22 days. J. D. McLaughlin's drive got out of the branches safely.

Forest fires have recently caused much damage in the vicinity of Shelburne, N. S. One fire at the north of the town burned thousands of dollars' worth of timber land, and several dwellings had narrow escapes. Another fire on the western side of the harbor was more destructive. It not only burned valuable timber, but worked into the villages of Gunning Cove and Churchover, the former nine miles from Shelburne and the latter seven.

A despatch from St. Stephen, N. B., states that the St. Croix Paper Company or gentlemen interested in that company, have purchased from Irving R. Todd the Eastern Pulpwood Company, of Calais. The business will be continued on the same lines as in the past, purchasing all kinds of pulp wood. The management will remain virtually the same, Walter L. Cobb being manager and Irving R. Todd, remaining a director.

There has been an almost unprecedented run of logs into the Fredericton booms since June 3rd. Over thirty million feet ran into the booms in two days. There was a big rise of water up river. The total amount in the booms on June 5th was forty-seven million feet. About eleven million feet of bank logs have come into Springhill this season and there is a large quantity yet to come which will make the season the heaviest in many years.

Contradictory reports regarding logging operations are received from Miramichi points in New Brunswick. The latest report, coming from Newcastle, states that operators estimate that two-thirds of the lumber cut on the Mirimachi will be hung up. Continued dry weather is the cause given and it is stated that the Miramichi Lumber Company abandoned two drives on the Dungarvon on June 7th. The south west Miramichi drives were expected to come out safely.

The Sherwin Williams Company of Canada, Limited, of Montreal, which has just been incorporated under Dominion charter with a capital stock of $8,000,000, has secured, among other things in its charter, the right to acquire timber limits and concessions for the manufacture of turpentine and other products dealt in by the company, to buy and sell timber limits, stumping leases and rights and to manufacture and deal in logs, timber limits, wood and all articles into the manufacture of which wood enters, and all kinds of natural products and the by-products thereof.

Mr. J. Burton and Mr. W. H. Wilson, representing the A. J. Burton Saw Company, Limited, of Vancouver, are considering the location of a branch of their business at Moncton, N.B. They recently met the Board of Trade and City Council of Moncton and submitted a proposition in connection with the proposal. They are asking for a loan of $30,000 or bond endorsement, in addition to a free site and concessions in regard to taxes and water. The intention of the company is to manufacture their products in the Maritime Provinces so as to save the expensive charges from Vancouver. The proposed plant will supply trade east of Port Arthur. Its cost will be about $50,000.

Western Canada

A. S. Hooker, Lumberman, Aldergrove, B. C., has sold out to A. Turner.

The Campbell Lumber Company Limited, Victoria, B. C., has been incorporated with a capital of $100,000.

The employees of the Canadian Western Lumber Company, at Fraser Mills, B. C., have organized a mill workers' union with Ald. John H. Campbell of New Westminster as president.

The British Columbia Gazette gives notice of the incorporation of the following companies: Fort George Trading & Lumber Company, Limited, capital $200,000; New Ladysmith Lumber Company, Limited, capital $400,000; Snowdon-Bidlake Logging Company, Limited, capital $50,000.

The Comox sawmill, Comox, B. C., was completely destroyed by fire recently. Everything was destroyed, including the office, books and accounts. The total loss amounts to $9,000 with no insurance. The mill was only built some nine months ago, at which time the old mill was also destroyed by a fire. The fire is believed to have started from a spark alighting in a pile of shavings.

A. A. Murphy, of Murphy Bros., Bonners Ferry, B. C., who have taken over the J. J. Grady sawmill at Duck creek, expected to have the mill operating early in June. They will employ about 50 men, at the logging camps and the mill. Among the improvements that have been planned for the Duck creek mill is the provision of a logging flume and a lumber flume, to convey the logs to the mill and the lumber from the mill to the railway. This will do away with the expense of teaming.

Reports regarding the proposed formation of a new lumber company in the Kootenay valley indicate that the C. P. R. is indirectly interested in the move. A saw mill costing $400,000 is to be constructed opposite Baynes, on the Kootenay river, in the vicinity of McConnell's Island, to which all the timber belonging to the newly formed company will be floated. This company is reported to have a capital of $20,000,000, and will include nearly all the mill properties above the point at which the mill is to be erected.

A large lumber merger is reported to be under way at Cranbrook, B. C. English capitalists, it is understood, are arranging to acquire the East Kootenay Lumber Company, the Baker Lumber Company, the King Lumber Company, the Standard Lumber Company, the Rock Creek Lumber Company, and other concerns, with headquarters at or near Cranbrook. It is said that the interests seeking to acquire these lumber companies have a working capital of $20,000,000, and if the deal is put through they purpose establishing a large number of retail yards on the prairies.

The merger of the Michigan-Pacific Lumber Company and the Michigan-Puget Sound Lumber Company which has been under progress for some weeks past has been accomplished by the incorporation of the Canadian Puget Sound Lumber Company Limited, with capital stock of $5,000,000. The headquarters of the company are at Victoria, B. C. The president is Charles W. Liken of Sebewaing, Mich., the secretary Orla B. Taylor, Detroit; the treasurer Guy S. Brown of Victoria; Dudley B. Waters, Grand Rapids, chairman of the board of directors.

A deal has been completed whereby an American syndicate, with whom is associated Mr. F. C. Adams of Portland, Ore., and Charles A. Barnum of Revelstoke, B. C., obtains control of at least 700,000 acres of timber and pulpwood areas in the interior, together with almost all the available lots in the corporation and considerable lands adjacent for the purpose of subdivision. It is the intention of this syndicate to erect a large pulp and paper mill in Revelstoke, a large sawmill at Big Eddy close to the city, and a power plant sufficient for the purposes of both concerns. For the erection of the pulp mill, Mr. George Hardy, of New York, has been engaged to prepare plans and is already at the work. In the near future an engineer will be brought from Montreal for the purpose of planning a dam across the Columbia river about three miles out of the city, which will supply energy for driving all the machinery. Two millions of dollars is the initial capital arranged for, but this will be increased later.

The Barnhart Log Loader

has been in successful operation in all parts of the country for twenty years and never caused a complaint. We are now manufacturing a new Barnhart Loader known as Model "12," which is specially designed for use in very heavy timber. This loader is built on the same lines as the old Barnhart Loader now known as Model "10" and which we still continue to manufacture. We are operating lumbermen, producing 200,000,000 feet of lumber per annum and we use the Barnhart Loader exclusively. Could we afford to do so if it were not the best? Write us for prices.

Jeffrey Wire Rope Conveyers

Are used extensively in the lumber industry

Because

They have greater efficiency and are more economical than other types of conveyers.

They are pre-eminently fitted for medium and long distance haulage; are employed with greater success in handling Lumber, Logs, Refuse, etc.

We have conveyors of this type exceeding 1,000 feet in length which are in successful operation.

The Advantages of the Shimer Cutter Heads

There's Nothing to Wear Out and They Can't be Broken

Shimer Cutter Heads are made from Steel Forgings and will stand the strains imposed by the heavy fast feeding machines. There is nothing to break or get out of order. The Bits are the only parts subject to wear and these can be renewed at small cost when needed, making the Heads practically as good as new.

The Long Life of These Circular Bits

which have a permanent profile and clearance protection, is due to the fact that the ENTIRE CIRCLE IS CUTTING EDGE as it wears back by use and repeated sharpenings—that the cutting edge is protected from unnecessary wear and friction by the inclined seats to which the bits are fastened—that the edge outlines only come into contact with the lumber and shape it correctly. All that portion of the cutter back of the cutting edge is brought into service as the cutter is sharpened and brought round upon its holding bolt to again fit the gauge. The average cutter will measure from 3 to 5 inches of cutting service for edge wear. This great amount of cutting edge (held in reserve) gives the flooring maker the CHEAPEST OF ALL TOOLS, aside from THE CONVENIENCE their use affords in maintaining uniform patterns. The fitting of the parts is a positive thing when using Shimer Cutter Heads.

These tools save in the cost of production, in time, care and vexation. They are made any size to fit any make of machine and sent on trial, GUARANTEED TO DO AS REPRESENTED OR NO SALE.

Write us about the machines you have and what you wish to make and we will help you to select Heads that will cut to the full limit of the capacity of your machine.

Panel Raiser Heads

We are putting out an excellent tool that will work nicely on any panel raising machine with vertical spindles. It is made in two sections, the one having a central hub, upon which the other section is slidingly mounted and fastened with a set screw. The knives for jointing extend from the flange on one section to the other, held by means of special dovetail shoulders which encircle each knife near its ends. It carries a heavy shearing cut, and works smoothly across end of panel as well as with the grain.

Price, each Head with Bits complete, $18.20.

Bit Grinding Machines

For sharpening Bits tempered too hard to file, and to lighten and hasten the work in the filing room, we make two styles of Grinding Machines.

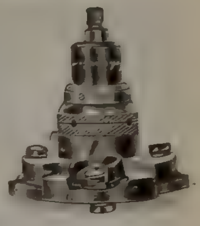
No. 1 is a strong and complete machine with every needed adjustment. Price net, with countershaft, f. o. b. Galt, $104.

No. 2 machine is lighter, yet sufficiently stong to meet the average need. Price, complete, $45.50 net, f. o. b. Galt.

Our "Best of All"

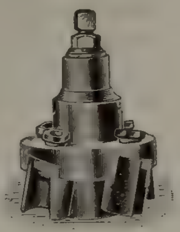
Figs. 202 and 203 are the leading tools, having Conical Duplex Bit Seats and The Shimer Cutter Head Expansion. Flooring Bits will work from 13-16 to 1½-in. thickness with tongue and groove proportions expanded to suit.

Price, net, complete with one set of flooring Bits, the gauges for setting the Bits and wrench $40.95
Extra Bits for Flooring $11.44
Extra Bits for Ceiling $10.40



With 4 Bits to each Head

Jointer Heads,



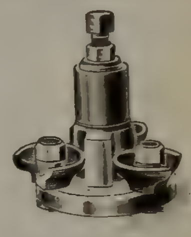
Figs. 54 and 55, with four Bits in line of work, shear the cut downwardly to insure a sharp and clean upper edge. They cut clean and free and are shipped out under our guarantee to give satisfaction.

Price, Heads, complete with Bits for 15-16 to 1¼-in., net only $31.20
Extra Bits 1¼ face, the set $10.40
Extra Bits, 2-in. face, the set $12.48

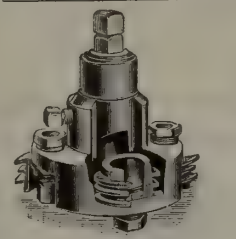
O. G. Batten Heads,

Figs. 48 and 49 represent our best tools for this work, having 3 Bits in line of cut so arranged upon their seat inclines as to protect all but cutting edge against friction and wear.

Price, two Heads complete with Bits, net only $31.98
Extra Bits each, net $2.08



Double Ceiling Heads,



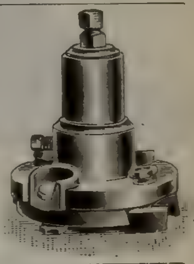
Figs. 45 and 46 are made in solid section, steel forged, with Bits of special design to cut two tongues on one edge of board, and two grooves on opposite edge, to be re-sawed for two thin boards tongued and grooved. Very complete.

Price, with one set of Bits, net $40.94
Extra Bits, per set of (8) $16 64

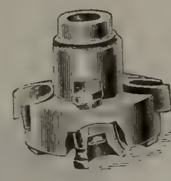
Ship Lap Heads,

Figs. 38 and 39 are made of steel forgings, in solid section, designed especially for heavy duty. The bit seats have the latest improved slants to provide free cutting edges, and we sell them at the following low and net prices.

Heads with one set of Bits to work 15-16 to 1½-in. thick, net $34.84
Extra set of Bits $11.96



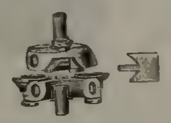
Door, Sash and Coping Tools,



That save all the hand fitting. No changing of patterns, therefore, no trouble in framing door and sash parts when matched with the Shimer Cutter Heads.

DOOR HEADS

Fig. 82, solid flange	$10.75
Fig. 84, with Expansion	13.35
Bits to work 1-in. to 1¼ doors, 4	7.28



SASH HEADS

Fig. 86, solid flange	$9.75
Fig. 206, with Expansion	$12.35
Bits extra to work 1 to 1¼-in. Sash (2 Moulded Bits, $4.30; 2 Rabbeting Bits $2.86)	$7.16

The Shimer Box Board Matching Heads

make a uniform cut and close fit, as well after years of use as when new, with no friction upon the Bits. For thicker material the Bits can be expanded.

Price for two Cutter Heads to match ⅜ to ½ inch, $29.15.

We also furnish when desired a Yoke Mandrel with self-oiling boxes, boxed f.o.b. Galt, $11.05.

No. 225 Triple Drum Sander. Patented Feb. 15th, 1910.

Worth $1,000.00 Per Year To You

are the following features of our New No. 225 Triple Drum Sander, the machine which turns out such perfect work that hand labor and rubbing are entirely eliminated. We guarantee this to be the best Triple Drum Sander made. The price is $300 Dollars more than any other, but it is worth it.

Because :—

It is the only Sander in three pieces so that in case of accident to the drums, or for recovering, it requires less than two minutes to elevate the entire upper works high enough to remove the drums, if necessary. You do not have to remove the bed plates or disturb the regular setting of the feed and pressure rolls. On any other make of Sander it would take from five to ten hours to dismantle the machine and put it together again, with the consequent loss of the use of the machine for that time.

Each size weighs 3,000 lbs. more than the same size of any other make—a more solid and better built machine.

Drums made of hydraulic steel pipe. Shell being in one piece, turned inside and outside, is perfectly balanced and non-breakable—other makes have cast iron drums, uneven on inside made in sections and in forcing to position invariably spring the shaft, making it impossible for this kind of drum to keep a perfect balance.

The paper is held absolutely tight on the drums by our automatic take up device. This is the only take up device which does not put the drum out of balance when it begins to take up the stretch in the paper. It is suspended entirely on the shaft and does not depend upon spring pressures exerted against the shell of the drum as in other makes.

The patented covering furnished with our drums is absolutely nonstretchable, firm enough to insure perfectly sharp edges and yet allow of a velvet finish.

In working quartered oak and other woods of this description having hard and soft spots, the finish will be perfectly even, while other Sanders dig out between the flakes.

All the mechanism of the entire machine is exposed and easily accessible, saving an operator many hours a week by being able to watch and prevent cutting in the screws and nuts thus preventing wear and insuring even pressures and good work all the time.

New sand paper can be placed on all three drums in from five to seven minutes, while on other makes of machines, best time ranges from 17 to 30 minutes.

With our Oscillating Attachment it is practically impossible to produce the markings so commonly found on the work of other sanders, generally termed waves and planer marks.

All working adjustments are immediately in front of operator and he does not have to leave his position to make such changes as are necessary.

The four corner screws are mounted on ball bearings insuring easy movement for upper works and long life and quick adjustments.

Our Feed and Pressure Rolls are all made of seamless steel tubing, being non-breakable and take a smoother finish than cast iron, thus turning out better finished material.

All bearings have reservoir self-oiling features.

Due to the qualities of our covering (the surface being absolutely true) the sanding paper is used evenly all over, thus making it last twice as long as on other sanders where the covering is a cheap quality of felt, either wired or glued on to the shell.

OILDAG

(REGISTERED TRADE MARK)

Deflocculated Acheson-Graphite, DAG, and oil.

Graphite does not dissolve in any liquid or break under pressure and these qualities, added to the unctious softness and purity together with its non-coalescing nature, make Acheson-graphite ideal for lubrication purposes. The process of deflocculation takes Acheson-graphite powder so fine that 99% of it will go through a sieve having 44,000 meshes to the square inch, and subdivides each grain of this finest powder into many still smaller particles—so small that they cannot be seen with a strong microscope. Oildag is this deflocculated Acheson-graphite suspended in oil where it neither floats or sinks but is evenly distributed throughout. Oildag will flow anywhere the oil alone will go.

Mr. Rob't. A. Ross, E.E. of Ross & Holgate, Consulting and Supervising Engineers, Montreal, writes:—

"As my firm are constructing and operating steam plants, we have wished to use a mixture of graphite and oil for cylinder lubrication, but have been prevented by the fact that the graphite settled out of the mixture. This difficulty you have overcome, and we are now assured of the best lubrication in the world, especially in super heated steam practice."

LOGGING AND INDUSTRIAL LOCOMOTIVES

The knowledge and experience gained in building locomotives of all types, capacities and sizes for every kind of hauling is applied to every locomotive we build, and is available to you.

Our small locomotives for logging, and light switching service are not merely selected from designs previously built, but are special designs to meet special requirements.

They are designed and built with the same care required for 200 ton locomotives. Only the best materials are used in their construction, and every part is made to jigs or templates, guaranteeing that repair parts will fit.

They are constructed with a view to the fact that they must sometimes be operated a considerable distance from shop facilities, therefore simplicity and sturdy construction are vitally necessary.

Fuel cost is always important. This is considered in the design and capacity of the boiler, and in the design throughout.

Write us concerning your requirements or ask for a consultation with our engineers.

We are in position to meet every requirement in locomotives and to supply repair parts at short notice from our Works at Longue Pointe, Montreal, Canada.

MONTREAL LOCOMOTIVE WORKS, LIMITED

BANK OF OTTAWA BUILDING, MONTREAL, CANADA

Twelve men *trying* to move an *empty* car

"Atlas" Car Mover

Patented in Canada in 1901

As shown by the accompanying illustrations will save your mens' time and your money. If it takes twelve men to move an empty car how many will it take to move a full one—it will take one man and an "ATLAS" CAR MOVER.

It is a small inexpensive article and every lumberman should own one. Can be shipped from Woodstock.

The "Atlas" Car Mover

One man *moving* a *loaded* car with an "ATLAS" CAR MOVER

Solid and Inserted Tooth
Circular Saws

We make a specialty of these lines

We remake old Solid Tooth Saws into new Inserted Tooth Saws

Write to us for quotations

Our saws have been before the public of Canada since 1855, and have won a reputation far excelling any other make of saws, combining as they do so many points of marked superiority.

By the old method the tempering of circular saws was to a great extent a matter of chance.

By our Patent Process that uncertainty is entirely avoided.

Being tempered and straightened by heat and pressure in air tight ovens at a uniform heat between heavy revolving plates, we produce a perfectly even temper throughout the plate, and being free from that uneven strain or tension caused by so much unequal hammering they are not so liable to buckle, which was a great source of trouble and expense in the old style of saw.

These saws will stand up to their work better under all circumstances, and being made of a higher quality steel than it is practical to use by the old method, they hold an edge longer and will do more work than any other saw on the market.

We are prepared to make prompt deliveries of all Saw Orders—Rush Orders by mail or wire receive immediate attention.

R. H. Smith Co., Limited

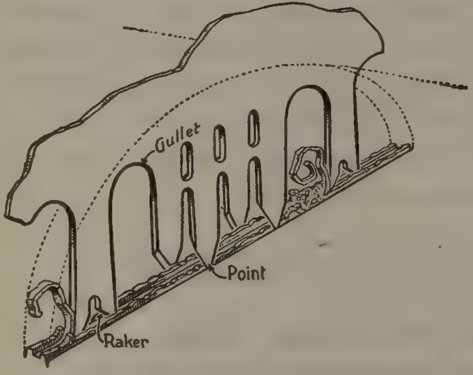
ST. CATHARINES, ONT.



Why Atkins Sterling Saws Run Free and Easy

Saws that depend on "set" for clearance have to tear their way through the timber, like the picture to the left. The teeth are sprawled out on either side and chatter and stick and bind and tear. That's why wood sawing is sometimes considered such hard work. That's why commonly ground saws can NOT run fast or pull easy.

ATKINS SEGMENT-GROUND CROSS-CUT SAW BLADES are ground thinnest on the center of the back. The teeth are the widest part, and the blade drops easily into the smooth cut which is made by the saw teeth. Very little set makes the teeth cut clean and the rakers clear the center. See the picture to the right. These Saws merely require enough power to pull them back and forth. That's why they run so easily.

ATKINS STERLING CROSS-CUT SAWS are the only Saws that are Segment-Ground, and for this reason are guaranteed to run easier and cut faster than any other Saws. Write us for free information, or order through your jobber or dealer. If they won't supply you, let us know.

USE

Your Mill's Refuse

To Dry and Preserve Your Wood

"The HOWARD" Vulcanizing Process

Positively the quickest and most economical system known for drying and Preserving Lumber, Railroad Ties, etc.

POINTS IN ITS FAVOR:

Improves quality of all lumber
Increases the crushing strength
Increases the transverse strength
Reduces the weight 30 per cent to 45 per cent
It materially prolongs the life of wood
Eliminates shrinking, swelling and warping
Emphasizes and beautifies natural grain of the wood
Makes fit for commercial use woods not otherwise merchantable
Does away with necessity of maintaining heavy stock of lumber in yards
By this process green lumber taken from the log can be used for building purposes in 2 or 3 days

We invite Lumbermen and Owners of Woodworking establishments to see a practical demonstration of the process at our plant in Toronto

Our descriptive booklet tells in a most interesting manner the advantages, etc., of "The Howard System." It's yours for the asking

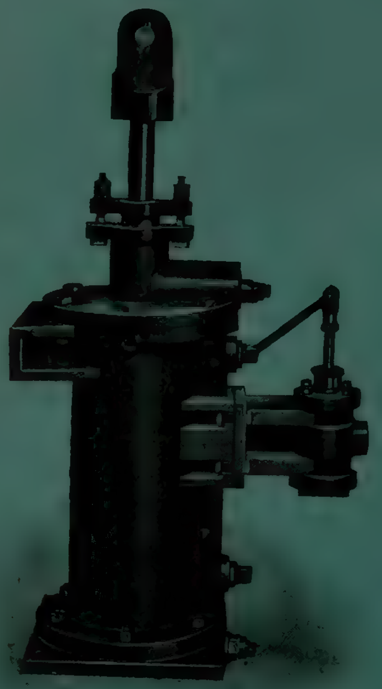
Log Handling Machinery



The cut shows the type of cylinder we have been putting on all our kickers, loaders and canters for over four years. In that time it has been thoroughly tested in many mills and its value has been thoroughly proven.

Notice that all piping between valve and cylinder has been done away with.

Notice also the check valves in head and base of cylinder. These valves cause the steam to cushion in the cylinder at each end of the stroke, thus preventing the piston or the top or bottom head being broken.

The
Grand Triumph
Shingle Machine

is probably the best known horizontal shingle machine made in Canada.

We are the original manufacturers of this machine in Canada and the only manufacturers in this country making the genuine Grand Triumph machine.

It will cut upwards of thirty thousand shingles in ten hours, and it requires for its greatest capacity only ten horse power to run it.

It cuts all of the bolt into shingles—no waste at the end. Send for our catalogue.

440 Square Miles Timber Limits

on Georgian Bay

to be Sold by Private Sale in Large or Small Blocks.

On account of their President and Principal shareholders being engaged in other large enterprises, and not having the time to give to them all, THE PARRY SOUND LUMBER COMPANY, Limited, offer for Sale all of the timber lands, mills and town property situated in the Town of Parry Sound; also Tug Scow and full Camp Equipment for five camps, including boom chains, snow plows, sleighs, etc.

THE LIMITS TO BE SOLD

comprise some 440 square miles of licensed and deeded Pine, Hemlock, Spruce, Birch and other timber. The licenses from the Ontario Government include all timbers and are not restricted for time. Government dues are as follows: Saw Logs, White Pine, $1.50 per M. ft., B.M. Saw Logs, Hemlock, Tamarac and other woods 75c. per M. ft. The timber is situated in the Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street. The Canadian Pacific, Canadian Northern and Grand Trunk Railways run through the limits, which makes some of the parcels offered for sale particularly desirable for small mill owners.

A circular giving full information, maps, terms and conditions of sale will be furnished upon application to

OILDAG

(REGISTERED TRADE MARK)

Deflocculated Acheson-Graphite, DAG, and oil.

Graphite does not dissolve in any liquid or break under pressure and these qualities, added to the unctious softness and purity together with its non-coalescing nature, make Acheson-graphite ideal for lubrication purposes. The process of deflocculation takes Acheson-graphite powder so fine that 99% of it will go through a sieve having 44,000 meshes to the square inch, and subdivides each grain of this finest powder into many still smaller particles—so small that they cannot be seen with a strong microscope. Oildag is this deflocculated Acheson-graphite suspended in oil where it neither floats or sinks but is evenly distributed throughout. Oildag will flow anywhere the oil alone will go.

Mr. Rob't. A. Ross, E. E. of Ross & Holgate, Consulting and Supervising Engineers, Montreal, writes:—

" As my firm are constructing and operating steam plants, we have wished to use a mixture of graphite and oil for cylinder lubrication, but have been prevented by the fact that the graphite settled out of the mixture. This difficulty you have overcome, and we are now assured of the best lubrication in the world, especially in super heated steam practice."

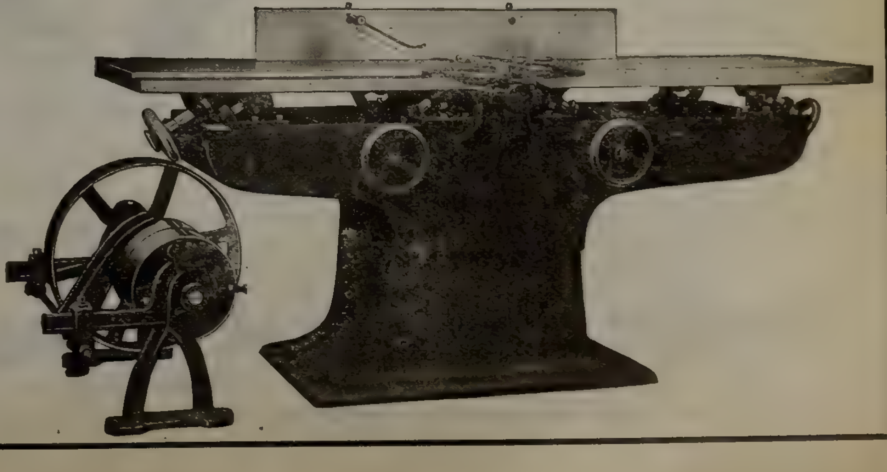
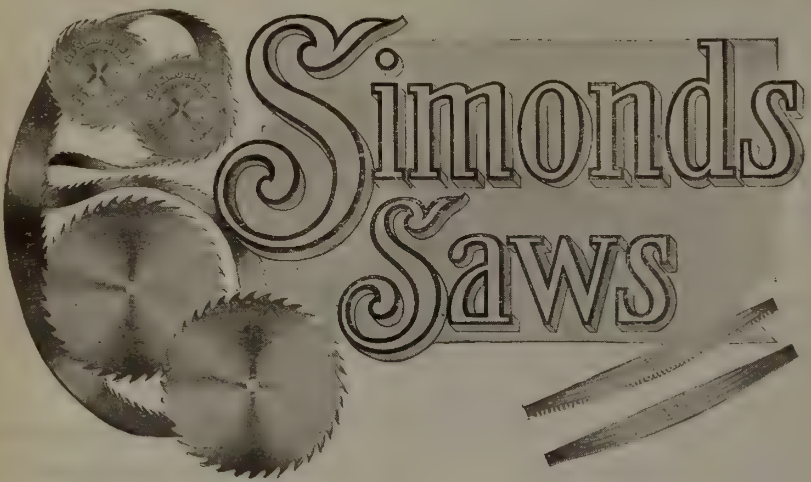
THE SILVER MFG. CO.,

375 BROADWAY SALEM, OHIO





This saw that represents the big economy whether Band or Circular, is not the one you pay the least for delivered down at your mill.

The frequency or infrequency with which they must be changed, and filed and tinkered with counts some, for this takes time, you know, the time that runs into money, and it is only the saws that are able to hold an edge and that won't crack, that make for economy.

Simonds Band Saws, because of the selected material used, their uniformity of temper, their hardness without brittleness, their eveness in grinding and strength of the brazing, are used in the biggest, busiest mills in the world for the sole reason that being so made they cut more lumber, stand more wear, tear, and hard driving, than saws of other make.

Your first order for a Simonds Saw, let it be Band, Gang, Cross-cut, or Solid or Inserted Tooth Circular, will make this so evident that it will never be your last.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Vol. 31 Toronto, July 1, 1911 No. 13

Uniform Inspection Needed

The attention of every reader of this issue of the Canada Lumberman is earnestly directed to a letter from a wholesale lumber dealer which is published on another page, and which refers to the all-important subject of lumber inspection. This letter is from one of the most highly respected members of the wholesale lumber business, in Ontario, a man who has been a long time in the business, who knows well what he is writing about, and whose opinions are respected by his fellow lumbermen, and acknowledged to be the well matured result of long experience. Frequently the editor of the Canada Lumberman has had the advantage of discussing the matter of lumber inspection with the writer of this letter, and has found him convinced that the day is approaching when a system of lumber inspection will be introduced in Ontario, which will do away entirely with the distressing uncertainties that prevail to-day.

In conversation with other members of the trade the editor of the Canada Lumberman has not found so much enthusiasm for the creation of an inspection system. He has found many well known members of the trade in its various branches who declare that it would be impossible to establish and maintain any definite set of inspection rules, because the grades are continually changed, and because every mill has its own system of grading already, and would not like to make a change, fearing that it would involve a serious interference with business methods.

These objections are made so frequently that one is obliged to credit those who hold them with being quite sincere, yet it is difficult to understand that these objections should be allowed to outweigh other far more serious objections to a continuance of the present unbusinesslike and quite out of date system. The grades of lumber do not change so rapidly that it would be impossible for a set of inspection rules to be drawn up, and to be changed sufficiently from time to time to keep in touch with actual conditions, neither would there be any serious change involved at the mills. The grades are pretty well established now. Everyone knows what "Number one common and dressing" means very definitely, and veryone knows what the other grades mean, or at least they should know. The manufacturer should be willing to insist that his inspectors grade the lumber exactly according to the understanding of the trade. If improper filling of an order is the result of careless inspection, the manufacturers' interests would be served by seeing that the inspector who is responsible is brought to book in some manner, so that the trouble will not occur again. If, moreover, the inspectors at the mills knew that their grading was liable to be checked over by a staff of independent inspectors employed in the interests of all the branches of the trade there would soon develop out of the present methods a degree of uniformity in connection with inspection which would perhaps astonish those who are strongly opposed to any such measure.

The foregoing does not mean that the fault is always to be laid at the door of the manufacturer of lumber. Complaints made by retailers are of many kinds. Some of them can be definitely traced to the incompetence of the traveller who has taken the order, and who has not known what he was selling. There are to-day far too many men on the road posing as lumber salesmen who know as little about lumber as they do about flying. The establishment of a staff of independent inspectors would help to remedy this trouble also. The traveller knowing that his interpretation of an order was liable to be checked up by a staff of competent inspectors, would be at considerable pains to become an expert in lumber grades as soon as possible. The dishonest representative of any particular branch of the trade in fact, would be checked in his operations and the benefit to all concerned would be great. Everybody in the trade, great and small alike, would be benefitted. The small dealer would not be at the mercy of the larger member of the trade, who can afford better than he, to lose a little money on taking a chance. The large operator would be protected from the small dealer in an out-of-the-way place who orders lumber and systematically complains, in the hope of getting **five** per cent., or so, taken off the bill.

The Canada Lumberman would heartily endorse, and assist to the best of its ability, any proposal for the establishment of a staff of inspectors which would do away with the continual complaints of improper shipments. It believes, with the writer of the letter referred to above, that the condition of the trade has been going from bad to worse of late, and that the only way to reduce the number of complaints to a minimum, is to carry out the plan suggested in the letter.

For the information of our readers we would add that the writer of this letter is in serious earnest in this matter, and is already doing his best to bring it to a head. For his assistance, and in order to know definitely what the trade in general thinks of the plan, the Canada Lumberman invites its readers to express their opinions in its columns.

Machinery Guards Increasing

The subject of sawmill inspection occupies considerably less space in the annual reports of the Factory Inspectors of the Province of Ontario this year than usual. As a rule several of the inspectors have a great deal to say about the protection of sawmill machinery, so as to prevent the occurrence of accidents. There has been a commendable inclination on the part of sawmill owners of late, to install modern safety devices. It is a matter for considerable satisfaction that in the report of the inspectors for the season of 1910, only one extended reference to sawmills is made. The single reference moreover, is of quite a commendable nature.

Inspector Robert Hungerford, who has a large number of saw mills in his territory, refers to them in the following interesting manner: "In my previous reports I have devoted so much space to the subject of sawmills that I have little or nothing left to say unless I report what has already been said. The great importance of the sawmill industry, and the personal interest hitherto manifested in this particular branch of work by me, however, will scarcely permit of my entirely omitting the subject from this report.

"At one time I dreaded going to a sawmill. I was for some unknown reason possessed of the poinion that not only were sawmills extremely dangerous, but that they were operated entirely regardless of law. I also had the idea that the men engaged in the lumber business, as well as the workmen, were an uncouth and rough class. In fact, many people seem to have got the same impression, for it is but a short time ago that I got into conversation on the train with a gentleman upon the subject of "sawmills," and in the course of his remarks he said: 'The people engaged in the lumber industry are a pretty rough bunch.' When I undertook to convince him that men engaged in the lumber business were no rougher than any other class of manufacturers, he either thought that I was telling him a wilful lie or that I knew very little of what I was talking about.

"Owing to my district extending to the far north country, including both the north and south shores of the Georgian Bay and New Ontario, my duties take me to the most remote parts of the province and in contact with a great many sawmill and lumber men, and in almost all cases I have found them the very reverse from what I had expected. During the three years I have been in the position of factory inspector, I feel perfectly safe in saying that in no industry have there been greater advances made in the way of taking precautionary measures for the prevention of accidents, and among no class of manufacturers have my recommendations been more cheerfully complied with.

"The fact that I have been agreeably surprised in the character of the lumber and sawmill men, and that they have shown a willing disposition to comply with my recommendations, does not for one moment remove the fact that a sawmill is "dangerous." With all the precautionary measures and up-to-date safety devices the sawmill is still a dangerous industry. Sawmills are dangerous because of the usual lack of room to safely operate the machinery and the high speeded saws that in some cases cannot be safely guarded. The modern gun shot or steam feed works with such rapidity as to greatly enhance the danger to those operating them. The introduction of gang edgers or circular gang saws, the over-taxing of machinery, and the rapidity with which the men in an up-to-date sawmill are compelled to work greatly increases the danger, notwithstanding the fact the mill owner may take every reasonable means of preventing accidents.

"I have frequently found fault with mill owners for apparent carelessness in allowing boys under the required age to work in the mill, particularly in the lath and shingle mills. I am pleased, however, that upon my last visit there was a marked improvement along these lines, and I am convinced that, speaking generally, there is no desire upon the part of the mill owners to violate the law in this regard.

"Sawmills have always been of unusual interest to me; so much so, in fact, that I have given them a great deal of study and attention, and have endeavored to put myself in a position of competency to at all times discuss and advise the mill owners in the arrangement of the machinery with a view of advantage and safety to those operating it.

"If any manufacturer appreciates the advantage of thorough organization in the operation of a plant I would invite him to take a look in at an up-to-date sawmill."

Investigating Retailers in United States Lumber Trade

It is difficult for Canadians to understand the situation which has recently developed in the United States in connection with the prosecution of a number of Eastern United States retail lumber organizations. The political aspect of the case has probably a great deal to do with it, and Canadians are not in a proper position to understand the political intricacies of United States affairs. Nevertheless there are some salient features in connection with the suits recently instituted by the Attorney General of the United States, charging the retail organizations with conspiracy in restraint of trade; which Canadians are considerably interested in. It is announced that these suits are the first of a series, the object of which is to break up alleged agreements among retailers of many of the commodities of life, to maintain high prices and to force all consumers to buy from retailers alone, and to blacklist wholesalers who sell to other than members of retail organizations in the various states and cities.

Ii is taken for granted that these organizations of retailers have for their object the unreasonable restriction of trade and it is proposed to prove this charge and prevent the organizations from continuing in this course of action.

In view of the results in the Standard Oil case these suits are invested with much importance, and will be watched with the greatest interest by the public. The fight in the courts should be a vigorous one. The retail organizations are strong enough to fight with determination against what they will consider an unjust attack upon their legitimate work.

Some time ago the government of the United States through its chief executive, announced its determination to do away with all great combinations in restraint of trade, the object of which was to secure unreasonable profit from the consumer. The public applauded when suit was brought against the Standard Oil Co., believing that the government was on the track of a real live monopoly. The result of this case however, has not been accepted by the people of the United States as a genuine victory for the administration. It will perhaps also become more than a suspicion as the present case proceeds, that the government has taken this latest step with a view largely to make a brave showing of living up to its announced convictions. If the government does not run the danger of defeat in this case it will be fortunate.

The retail lumber organizations of the United States may be indulging in the practice of drawing up a list of wholesalers whom they consider fair business men, deserving of their patronage. They may be in the habit of preparing prive lists, upon occasion, for the guidance of their members. If they have been doing these things they have not necessarily been deserving of censure. There is a world of difference between drawing up a price list for the benefit of members of an organization, who derive no profit from that organization, and drawing up a price list for the use of the various members of a trust, which list becomes a cast iron selling document regulating absolutely the price to the consumer. The price list which a retail organization draws up is more of a guide to the members than anything else. It is no infrequent thing to hear soon after a meeting at which such a list has been arranged, that members are already failing to observe it. Sometimes the list even becomes a boomerang, supplying those who desire to cut prices with a clear statement of the figures which their competitors are likely to ask.

Retail organizations, in addition to such action as arranging price lists and drawing up lists of wholesalers whom they believe to be worthy of their patronage, have devoted a large share of their time and energy to the commendable purpose of improving business methods and business ethics. At their frequent conventions, they have dose much by means of addresses and discussions to lift the trade to a much higher level. Their work is representative of that spirit of co-operation which has done so much within the last few decades to simplify commerce, and to improve the actual conditions of life. No retail associations of lumbermen have ever been able to set prices and insist upon their being observed by the trade. If they ever did reach such a height of influence they would have accomplished more than they can every hope for, and the very fact that they were able to carry out such a course would mean that there was no further necessity for their existence.

Canadian retailers have not the same danger to fear in connection with their trade as those in the United States. Fortunately the law in Canada has been pretty definitely laid down and retailers are permitted to organize, and carry on their work in a legitimate manner. They are under government control, and the day will probably come before long, when retailers who may desire to regulate prices will submit these prices to the government for ratification before they become effective. Such a course would be acceptable to all parties, and would be in marked contrast to the situation now prevailing in the United States, under which a drastic law which admittedly has failed of its purpose is invoked for the persecution of retail organizations whose activities are purely reasonable and justifiable.

The Greatest Problems of the Lumber Trade

The efforts which have been made for some time to bring about a better understanding between the manufacturers, wholesalers and retailers of lumber in the Province of Quebec and in Eastern Ontario seem to be a little near accomplishing something definite than they have ever been before. It is the belief of most people who have anything to do with the lumber industry that it has suffered more on account of the unreasonable cussedness of its members than any other trade on earth. Those who have been connected with the trade for any length of time also feel that all that is really necessary to remedy this condition is to get the members together and talk the matter over. The problem then is, why has not this been done long ago? No one seems to know. Strained relations between prominent members of the trade and industry are all too common. There is no excuse for them. It should be possible to carry on a lumber trade in a gentlemanly manner, and in a manner which would be much more certain of producing a profit.

The problems which concern the different branches of the lumber trade are not all new. They have been met and solved in other industries time and again. They involve primarily, fair dealing and secondly they require a definite basis for the mutual understanding of trade technicalities and methods. In the lumber trade to-day there is as great a percentage of honorable fair-minded business men as in any other trade. But they do not understand each other as they should. They are content to grope about in the dark far too much and occasionally when they cannot understand their confrere they find it necessary to suspect him.

Let the members of the trade in all its branches get together and discuss one or two questions only. Let them come first of all to a definite agreement among themselves as to what constitutes the various grades of lumber. There should be no question as to what a man means when he given an order for a certain line of lumber. Until this point has been threshed out and a solution agreed upon, all the meetings of lumbermen for the purpose of improving trade conditions will be of little or no use. What is the use of retailers getting together periodically and reading intricate papers upon the importance of a modern bookkeeping system in their business if all their calculations of profit are to be upset by a misunderstanding with a wholesaler, which could have been prevented if such participant in the deal had only known what the other meant What is the use of a manufacturer estimating to a nicety the cost of producing his lumber and basing his price thereon, if an incompetent inspector grades his shipments improperly and renders him liable to foot a bill for freight upon lumber which has been returned What is the use of carrying on the trade at all if one does not know what he is doing, whether he is making a profit at all, or whether he is letting himself in for a costly law suit,

When the matter of grades has been settled the question of fair dealing has to be faced. This is a rock upon which many an industrial vessel has been wrecked. It should be reasonably easy to come to a fair understanding in the lumber business as to the respective activities of the different branches of the trade and industry. The lines are so well indicated by nature that if the other uncertainties of the trade were eliminated there would be very little poaching upon each other's natural reserves. In some parts of Canada this happy condition of affairs is being slowly brought about. Why it should not be hastened by deliberate action such as that which is reported from Montreal is more than most people can understand. The example of the lumbermen of Montreal should be studied and emulated by those of other parts of the country and the hap-hazard methods of doing business which have resulted in such extensive loss in the past should be superseded by modern methods and modern ideals.

Editorial Short Lengths for Busy Readers

More than two hundred lumbermen and manufacturers have been subpoenaed by the United States government to give evidence before the court in connection with the federal investigation now in progress, at Chicago, into the operations of the alleged lumber trusts.

Ontario may have a new pulp district which will challenge those of Quebec if the result of the investigation to be conducted by a party from the Interior Department into the pulp possibilities of the English River district proves as successful as expected. The English River is the boundary between Ontario and the new district of Keewatin, so that the work of the party will be of interest to both.

Because the tendered cost of Canadian lumber was excessive, the Grand Trunk Pacific Railway has placed orders for large quantities of lumber with American lumbering concerns in Washington. Canadian Pacific Railway buyers have advices from William Whyte, vice-president at Winnipeg, to buy Canadian lumber, and have placed contracts for nearly two million feet with Victoria firms. A recent order given by the C. P. R. was to the Victoria Lumber and Manufacturing Company for 500 box cars.

Mr. J. W. Currie, a graduate of the forest school of the New Brunswick College, will be in charge of a party which will leave shortly and will be away during the summer and part of the fall. It will determine as far as possible the extent of the pulp resources of the English River and its tributaries and the facilities for getting the timber out. With the rapid exploitation of the pulp land of Quebec Province, the finding of a new source of supply has become a matter of considerable importance to the country. "The district should be a good one if the forest fires have not worked too much havoc there," says Mr. R. H. Campbell, Superintendent of Forestry. "It is undoubtedly a good spruce country.

Careful and conservative estimates, made by Canadians in a position to know, state that within five years the United States pulp forests will be practically depleted and within ten years they will be absolutely devoid of all pulpwood, unless in the meantime the pulp makers of the United States continue to have access to the Canadian forests. The consumption of paper has increased so rapidly in the United States that publishers to-day are, practically speaking, at their wit's ends to know where to obtain sufficient supplies for their needs. Canada is looked upon by the Americans as the most fertile field for the supply of their needs. At present the Americans are importing 1,000,000 cords of pulpwood yearly from Canada, 500,000 cords from Europe in the form of chemical pulp and 300,000 cords from Canada in the form of pulp and manufactured paper. This makes a total of 1,800,000 cords of wood annually imported into the United States, and its consumption of pulpwood totals 4,500,000 cords a year. A few of the large American paper mills have acquired large areas of pulp forests in the United States and these few mills will be able to last longer than the others, but the vast majority of them are dependent upon Canadian pulpwood in order and New Brunswick keep seventy-five mills going in the New England and eastern states.

Important Sawmills of Georgian Bay

No. 1. The Victoria Harbor Lumber Company's Splendid Plant—Combined Product of 300,000 ft. Per Day—A Model Yard Piling System

At Victoria Harbor, Ont., which is situated near the southeast end of Georgian Bay, are located the three mills of the Victoria Harbor Lumber Company, one of the pioneer lumber manufacturing companies of the Georgian Bay district. Victoria Harbor is one of the lumbering towns which dot the shores of the Georgian Bay and which practically owe their existence to the lumber industry. The town is delightfully situated and from the practical lumbering point of view has advantages which have counted much in the development of the Victoria Harbor Lumber Company's business.

The Victoria Harbor Lumber Company was organized about 1886 by the late John Waldie, a man who made for himself, in the lumber business of Canada, a name which stands in the highest rank. When he went into the lumbering business he had already obtained an intimate acquaintance with its details, having had much to do with it through his banking connections. The mill, which was taken over by Mr. John Waldie at Victoria Harbor in 1886, was on the site of what is now known as the No. 2 mill. This mill had formerly been the property of Mr. Richard Power, from whom it was acquired by Mr. Waldie. Mr. Waldie at once commenced to develop the industry along the lines which have since been followed successfully by himself in his lifetime and by his sons who succeeded to the ownership of the business. Subsequently a timber mill was built which is known as No. 1 mill and this was followed in 1900 by the erection of another mill which is known as No. 3 mill.

These three mills, which, together with the power house and a splendid piling yard, make up the company's plant, are equipped with everything which goes to the creation of a modern and efficient lumber producing plant. The mills are under the capable management of Mr. C. P. Waldie, who resides at Victoria Harbor and who devotes his whole time to the business of superintending the plant and its output. The other members of the company are Mr. F. N. Waldie, president, and Mr. R. S. Waldie, vice-president, who devote a large portion of their time to the affairs of the head office at 12 and 14 Wellington street east, Toronto; Mr. Scott Waldie, who looks after the company's interests on the road, and Mr. W. E. Harper, secretary.

No. 1 mill, which is used as a timber mill and planing mill combined (a view of which is shown in one of the illustrations accompanying this article), has a capacity of from 40,000 to 45,000 feet in a ten-hour day. It is equipped with a single cutting band mill, a planer, four matchers, one large surfacer, capable of taking timbers up to 16 inches square, and surfacing four sides at once, one resaw, one moulding machine, three rip saws, and a lath mill and a shingle mill and a timber boring machine. In this mill the company produce every kind of finished lumber and the excellent quality of the product has made for it a splendid demand.

The equipment of the No. 2 mill includes a double cutting band mill, one circular saw, which is used for slabbing cants for the gang

saw, one gang saw and a lath mill. A view of this mill is given herewith, showing the sorting tables and a part of the tramway system.

No. 3 mill contains two single cutting band mills, one gang saw, one slab resaw, and a lath mill. This mill has also a capacity of about 125,000 feet per ten hour day.

An interesting feature of the plant at Victoria Harbor is the excellent facilities which the company have for piling their lumber. The manner in which the yards are laid out has been frequently commented upon by experienced lumbermen as being the best that they have ever seen. For the work of shipping, the company employ a couple of locomotives of their own. Tracks are laid between the lumber piles and the locomotives take the loaded cars from the yards to the railway which adjoins the yard or to the dock for water shipment.

The limits from which the Victoria Harbor Lumber Company secure the logs for their mills are located on the Whitefish and French Rivers which flow into Georgian Bay near its northeast corner. The company have their own tugs for the purpose of towing their logs from the mouths of the rivers to Victoria Harbor. Upon the rivers they use alligators and tugs in connection with the drives. The journey of a tug from the north shore to the mills with a boom of logs occupies about one week.

An entirely separate sawmilling business is conducted by the Waldies at Spragge, Ont., on the North Shore of Georgian Bay, under the name of Waldie Brother Limited. The limits from which supplies of logs are secured for the Spragge mill are located on the Serpent, Blind and Mississaga Rivers. An illustrated article, descriptive of the Spragge plant and business, will appear in a later issue of the Canada Lumberman.

The Canadian Trade Commissioner at Birmingham, Eng., reports that an inquiry from Liverpool for cargoes of Canadian birch has come to hand, and the following specifications would indicate the average composition of a cargo:—

250 to 300 standards, Canadian birch, 2 in. and up thick—say 2 in., 3 in. and 4 in., few 5 in. x 4 in. and wider, random lengths.

An extract from the letter, intended to be submitted to a Canadian exporter, gives further particulars: "We shall be glad if you will kindly quote us your lowest price c.i.f.—cost, insurance and freight—to Swansea, Llanelly, and if possible Port Talbot. It is just possible that you may have previously exported some parcels of this tin-plate-box-grade of birch, in which case you will know exactly what is required, but on the off chance that this is fresh business to you we would mention that the stock is that usually shipped from West Bay, Halifax and St. John, and district. What is expected is good, sound and clean timber.

"Should we be successful in getting to business there is no estimating the quantity required. We have supplied quantities of this birch from Riga, but several of our friends are, in addition to this supply, importing quantities of Canadian. The price at which the stock is being sold c.i.f. the South Wales ports is between £8 to £8 7s. 6d. per standard, or say $19 per M. You should secure a freight rate of about 37s. 6d. to 42s. 6d. per standard for direct cargo. A trans-shipment parcel would make your figure prohibitive.

"With regard to terms, we act solely as brokers, accepting no responsibility of claim for inferior quality, etc., but we look after our shippers' interests to the very best of our power. Your prices would need to include 2½ per cent. discount to buyer, and 4 per cent. commission to us on the c.i.f. value, and we would be prepared to accept your draft for 80 per cent.—90 per cent. of the f.o.b. value, the balance to be remitted with A/sales, say thirty days after arrival."

The Red Cliff Lumber Company is interested in property at Port Albernie, and when the Panama canal is opened will probably erect a mill at that point.

Pacific Coast Loggers in Convention

Largely Attended Gathering held at Vancouver—Practical Addresses on Important Subjects — Great Strides made in Logging Methods

The annual meeting of the Pacific Logging Congress was held at Vancouver, B.C., on June 22, 23 and 24. There was an excellent attendance and the numerous addresses which were delivered were both interesting and of much practical value. An address of welcome was delivered by Mr. J. A. Smith, president of the British Columbia Loggers' Association and a reply by Mr. E. B. Blake, Seattle, Wash., president of the association.

The secretary-treasurer, Mr. Geo. M. Cornwall, Portland, Ore., in his address, gave a brief report of the progress of logging since the last congress. Great strides, he said, had been made not only from a mechanical standpoint but on broader lines encompassed in the great logging branch of the lumber business. He referred particularly to the labor problem, stating that in order to obtain good work from the employees in a logging camp it was necessary to exert the highest class of talent and generalship.

"The betterment of sanitary conditions in the camp," he said, "through supplying adequate facilities for bathing, and attempting some form of recreation, is the first step towards establishing permanency of occupation in the camp. Despite the migratory tendency of the majority of the young men, it is well-spent effort to try and build up a small community of homes that will minister to the social and domestic instinct inherent in everyone. To this end the cutting up of tracts of cut-over lands, sold to men of families, has already resulted in producing a markedly beneficial effect in the permanency of the crew."

In conclusion Mr. Cornwall said:

"The interest aroused by the Pacific Logging Congress in the science of logging engineering has been widespread. The published report of the second session has been been distributed throughout the world. Calls for the report have come from Siberia, Japan, Formosa, Philippine Islands, Mexico, Bavaria, Dutch East Indies, Australia, Tasmania and New Zealand, as well as from all parts of the United States and Canada. Copies have been distributed among the students of the forestry classes in the Northwestern universities, where it is regarded as a text-book. The Congress has for its mainspring the dissemination of the best ideas in modern logging practice. Its scope is unlimited, and it has been able through the generous manifestation of that spirit of helpfulness characteristic of the men who are engaged in a mighty industry, to make its power felt in elevating and broadening the sphere of influence of this industry."

Among the interesting addresses which were delivered by members of the Congress were several by well-known Canadian lumbermen as follows: "Forest Fire Protection in British Columbia," by W. C. Gladwin, Provincial Fire Warden, Vancouver; "Logging in the Interior of British Columbia," by Otto Lachmund, manager Arrow Lakes Lumber Company, Arrowhead, B.C.; "Adaptability of the Cable Locomotive on Steep Grades," by R. L. Fraser, manager McNair-Fraser Lumber Company, Vancouver; "British Columbia Logging Conditions," by A. J. Hendrie, Vancouver; and "Timberland Taxation in British Columbia," by W. Innes Paterson, Paterson Timber Company, Vancouver.

The business sessions were well attended and occupied the attention of the delegates during Thursday, June 22, and Friday, June 23. On the evening of June 23 a banquet was tendered to the visiting delegates. On Saturday morning, June 24, a visit was enjoyed to the mills of the Canadian Western Lumber Company, at Fraser Mills, near New Westminster, B.C., where the visitors were entertained at luncheon, after having been shown through the splendid plant of this company. On Saturday afternoon a char-pitting demonstration was given by Professor H. W. Sparks, and the party then returned to Vancouver.

Logging in the Interior of British Columbia

Mr. Otto Lachmund, in his address upon "Logging in the Interior of British Columbia," spoke as follows:

Interior British Columbia logging present many phases and difficulties which to the loggers of eastern Canada, and of Wisconsin, Minnesota and Michigan, are new, untried, and when first met with, bring about many discouragements. There have been cases in the mountain districts of this province that have amply proven this. The logger from the east generally comes here with the idea that he can show the "old timer" in British Columbia things he never knew about logging. He smiles at their ways, and is prone to believe that he and his methods are rather superior to them and theirs. The more he arrogates to himself, the further he is bound to climb down from his pinnacle. So many things have to be taken into consideration that the new comer, however successful he has been where he hailed from, must take account of climate, the excessive fall of snow and consequent rush of waters when the sun gets in its work; the topography of the country, the dense underbrush, the high cost of commodities, especially horses, the difference in laborers, yes, even the festive mosquito has to be reckoned with.

An interesting case comes to my mind showing what the unusual and unaccustomed mean to the man whose operations in the "bush" have been conducted under conditions in a less rugged country. This man was from Minnesota, where he had enjoyed a reputation of being a first-class logger. A short visit in the mountains of British Columbia had convinced him that logging, as he found it, was needlessly expensive. There was no occasion, in his opinion, for logs in the water, ready to tow, costing more than $4. In fact, at that figure, he could see a fine profit, and undertook to prove it. With what result? With the same facilities in every particular he was six months getting out about a million and a half, and the cost was more than $10 per M.; where prior to his taking the job, they had cost about $5. We have all had more or less to learn by experience, and there is yet more to learn. That is why, I take it, the idea of a "Logging Congress" took tangible form. It was not the pleasure of the writer to take part in previous sessions, but from a careful reading of their proceedings I believe that the valuable papers read have been of material help to every logger, that we have all learned something worth while. The logging congress has come to stay.

Many difficulties are yet to be overcome. That is especially true of the interior on this side of the line, where we have the deep snows of winter and the wild mountain streams of summer to contend with. On the coast the donkey engine comes into play, but in the mountains, though tried in numerous places, they have been generally abandoned because the timber is too small to do efficient work with them. So far, nothing better than the horse has been devised for yarding logs. Horses, however fit for the work, made hard by the rough contour of the country, the hard climb of the steep mountain side, rarely last more than six years, their average time of usefulness being nearer four years. To get supplies to the camps usually requires four-horse teams. All this means cost. Mountain streams are very rarely dependable. For that reason, mainly, logging railroads are being more and more installed. With us, there is a marked advantage in sawing green logs over those that have been tossed about in the streams, because they are free from stones and sand, which makes a big saving in saws. Green logs saw out more easily and a bigger cut is secured than is the case with logs that have been in the water for some time. So that, entirely aside from the uncertainties of driving, the railroad is much the preferrable mode of handling logs. The time is not far off when timber more remote from the mill, and less accessible, will of necessity have to be utilized. To-day it would be a costly, if not impossible thing, to log it; but when the day comes when that bridge must be crossed, we will no doubt have learned how best to tackle the problem through the medium of these congress meetings.

One of the greatest, if not the chief trouble, the mountain operator has to contend with, arises from the lack of dependable labor. Shortage of labor is responsible for a foolish practice that obtains more or less frequently in the interior, when one bids against another for it, which, of course, serves no purpose other than to drive up the cost of labor, for it does not augment the supply. We read of, and are told, that in many sections there is a surplus of labor, and yet, because of the lack of co-operation, the employer is not enabled to correct the condition confronting him. To us, therefore, the address by Mr. Elliott, of Chemainus, at the last annual congress, was a timely one. It struck the keynote. Mr. Young well characterized this paper when he said: "that seems to me to have the right swing and is worthy of consideration." Mr. President and gentlemen, we believe that when the suggestions put forward by Mr. Elliott are acted upon and become a realization, much of our trouble will be eliminated. Not long since it was a well-known fact that at Spokane no less than four thousand men were idle on the streets, while at that same time laborers in our section were asking for more pay.

It has been well said that labor is a commodity the price of which varies with demand and supply, such as any other product. We are believers in the wisdom of paying good wages, and in that respect, is not the employer of to-day in the northwest generally treating his men in the camps and at the mills as men in like occupation in eastern Canada, in Michigan, in Wisconsin, in Minnesota and the camps of the south, never before were treated? Compare wages paid to-day with those paid in the best times of the industry in the places named. Compare the fare of our times and theirs at the camps. Nowhere is the man of the bush so well fed and cared for as in the northwest. Were the "old timer" of Ontario, of Michigan, and Minnesota, to enter one of the camps of British Columbia, Washington, Idaho or Oregon, and look upon the tables laden with the best of meats, the choicest of vegetables, the different kinds of pies and cakes, with fresh strawberries, even, and other fresh fruits, and recall the sowbelly and beans of his day, would he not be likely to drop dead from heart failure?

The fire menace in the interior here, as in the United States, where there is much less moisture than on the coast, is a very grave one, especially in our country, where the underbrush is so heavy. As more attention is being paid to the matter of burning slashings, as the government is keeping a more watchful eye on settlers, there will be a growing improvement. Change of wood and coal fuel in locomotives, etc., to crude oil will also prove a great factor in minimizing the danger. Moreover, oil will no doubt be cheaper than either of the others. Recently Mr. Whyte, vice-president of the Canadian Pacific Railway, has announced: "That as a result of an examination of conditions in the mountains, it has been definitely decided to use crude oil as fuel on engines steaming through the timber country, because the present fuel causes bush fires, which are enormously destructive, and because firemen cannot stand the strain of a 130-mile run firing a big locomotive." This is news we will all rejoice over.

In closing, I realize full well that what I have said contains little that is new. It deals with facts rather than with practical suggestions. My mission here is to be instructed rather than to impart anything that could be of value to men who have had much more experience. I feel that I have been honored in being able to address you at all, and thank you.

Timber Land Taxation in British Columbia

Mr. W. Innes Paterson delivered the following instructive address upon "Timber Land Taxation in British Columbia":

In these later days when the word conservation has assumed such an unwonted importance, the subject for which it stands, the more careful and economical use of our natural wealth, threatens to dissolve cabinets and depose cabinet ministers, we, who are the more closely associated with the actual carrying out of some of their far-fetched and often impractical ideas, should know from experience and observation what tends more to accomplish the object aimed at.

In British Columbia I feel certain we have a state of affairs that will prove to be the killing of the goose that lays the golden egg, and I must say she has been a most prolific layer during the last few years; yet it is deriving revenue at the wrong end of the deal, as a very large percentage of the lands held on special license cannot stand $140 per year tax. The reults will be the holder will have to take off what is marketable as quickly as possible to recover what he has invested in the property up to the present time, which will leave the balance a prey to fire, and thus a large amount of what later on would be marketable will be destroyed.

We only have to visit the older provinces of Canada and states of the United States to see the ruthless destruction that took place even when the taxation was very small compared to what we have to pay in British Columbia. The desire to realize made them take out what was marketable often at an actual loss in the operation on account of over production. To-day these lands are in many cases practically a desert. No second growth of any practical value, as the cutting over of large areas in one season when a fire once gained a foothold the destruction wrought is much greater, and the distance of seed trees prevents natural reforestation. What a source of wealth this timber would be if standing at the present time, which had absolutely no value at the time the operations were carried on. Many of these areas that escaped the destruction by fire were logged over as much as four times, and more money was made during the last operation than on any of the previous ones. In the early stages of the lumber industry in the east operations were carried on if not at an actual loss, with only a small margin of profit, and consequently a very small royalty to the government.

This will always be the tendency in a new country. The timber is the most accessible natural resource of any new and timbered country, and can be taken out and marketed in the initial stages of the development of the country with a primitive equipment, the operator selecting the best of the material and the most accessible areas, and is satisfied with small profits as it is generally an adjunct to some other business. The tendency is always for the production to follow up and almost invariably to exceed the demand until the awakening suddenly comes, and it is true that the supposedly inexhaustible supply is rapidly nearing the end. The pity of it all is that the margin of profit is so small and so much of the timber on the area cut over is wasted on which the government gets no royalty and the operator gets no returns. This has taken place to an alarming extent in sections where the ground rent was merely nominal, and where, generally speaking, the lands were better timbered on an average than we have in this country, so what can we expect in British Columbia when the ground rent is 22 cents per acre, and the regulations regarding staking were such that a larger percentage of the land staked must necessarily be useless as timber land. The only thing that can possibly happen is a frantic attempt to realize what has been put in on the poorer claims as soon as possible and abandon them. This will always tend to keep the manufacture of lumber in a chronic state of over production with consequently small profits and small royalties to the government.

In a country with physical features such as British Columbia where the logged over lands are so often worthless as farming or agricultural lands, the aim should be to conserve as much as possible the existing crop, which cannot be done with an excessive ground rent. On the other hand, unless the large lumber manufacturing concerns are allowed to have arrangements made for a sufficient amount of timber for a number of years in advance, they will not make the investment in manufacturing plants necessary to economically manufacture the raw material into the variety of forms which is necessary to make the most of it; still the matter cannot be solved by the government holding the land unless they also operate the mills; an illustration of this is plainly seen in Germany, where the lumber mills are of the most primitive nature, and most expensive in operation. No manufacturer will put in a large plant investment when the supply of the raw material is so uncertain, and is doled out by the government as they see fit a few months in advance of the actual requirement of the operator, and in a very uncertain manner and at a very uncertain price.

In a new country this system cannot be carried out. Another very important feature from the government standpoint, in the early stages of the development of a country the disposing of timber lands in fee simple or by lease or license is one of the most available sources of immediate revenue. Thus it is one of the most available sources of immediate revenue, both for the government and for the operator, and it would seem that all that can be obtained is to reduce the inevitable waste and destruction to the lowest possible minimum.

There is no question but that the rental of 22 cents per acre, as we have it in British Columbia, regardless of the nature of the concession held by the individual paying this tax being as must on an acre containing 10,000 feet as on an acre containing 100,000 feet, can only produce one result, and that is, get what you have in it out of the poorer holdings at the earliest possible moment and abandon them. It would seem only reasonable that there should be a readjustment at no very late date, and that timber lands should be taxed in a rational manner which would be in proportion to the value. 22 cents per acre as a ground rent fee is excessive, and I feel confident that the government of British Columbia will realize this at no very late date, but as in all new countries it is just possible that they may not awaken to the fact until it is too late to save a vast amount of material which in a few years will be a source of wealth, both to the government and to the operator.

This, I feel, is a matter of the utmost importance in the province of British Columbia. There is no reason why the government of this province might not be receiving a reasonable revenue to assist in the development at a time when revenue was very difficult to secure and where every dollar judiciously spent produces such great results. Should the timber holders in the province decide, as they must do, to abandon a very large percentage of the timber lands which are now being held under special license on account of the value not being there to justify the expending of 22 cents per acre per year ground rent, the government will lose the revenue from these lands for years to come, and although they will have the land, still a moderate revenue from them to help in the development at the present time might be of incalculable benefit to the province before the time arrives when these abandoned lands will again be in demand.

During the wholesale staking of timber lands in the years 1906 and 1907, very much that is practically worthless was staked from which the government have been receiving a revenue while the parties have been holding them as a speculation in the hope of making a sale at a small profit. Many have already done so, and the day has arrived when the matter of the $140 per year is getting of such serious importance that the prosaic cruiser and surveyor must be sent out and report conditions as they really are, and the revelation in store will certainly surprise all parties concerned looked at from the government standpoint. Naturally the timber owner will select the best, and those licenses he will discard will be on the outskirts of the valleys. Once the valleys are logged off the discarded lands which the government owns on mountain slopes being left by the operator will almost invariably be destroyed by fire, or if they esecape the fire the cost of operation will be prohibitive once the improvements in the first operations are abandoned.

Public Sentiment with Regard to the Conservation Question

To any one who is familiar with the situation it is quite evident that there is a growing tendency on the part of the public generally, who are not directly interested in timber lands, to clamor for what may prove to be an undue equity in the profits accruing from the development and operation of timber lands. This disposition is quite evident all over the American continent, and while there is no getting away from the fact that up to the present time there may have been abuses and the operators have in some cases received an undue profit from the natural resources of this continent, still even in the most glaring instances these individuals are companies who have taken the initiative and have by their shrewdness and business ability developed markets, introduced economies which enabled them, while many of their competitors failed in the same line of business and under equally favorable circumstances, to in many cases acquire a very large fortune, thinking to profit by previous experience, there is no doubt sentiment is growing to handle these natural resources as public utilities, thinking that thereby the operators' profit would accrue to the benefit of the public at large, but this does not always necessarily follow, and particularly in a new country where competition is keen.

As an illustration of this, as referred to before, we have only to go to Germany and witness the extravagant and obsolete methods used there in their sawmills, which so far as I can see, is entirely owing to the fact that they have no assured supply of timber in advance to warrant them putting in sufficiently large and economical plants to operate cheaply, and I was convinced of this fact while in that country, that a well equipped and managed sawmill with timber limits to warrant them laying plans for many years' operations in advance would certainly be able to pay the government a very fine royalty, probably more than they are getting out of it at the present time, and still the operator would make a magnificent fortune, and I think there is no other one thing where the legislators of the Dominion of Canada, and particularly British Columbia, will require to exercise more caution and good judgment than in the regulations, restrictions and taxation of its timber land.

There is no operator but what must admit that the government must participate in the increasing value of stumpage; but personally I believe there is nothing that would tend more to make the lumber business more profitable to all parties concerned, the government included, than a reasonable taxation based on the actual value of the holdings, reasonable restrictions on the operation and cutting of timber land, insisting upon the least possible waste, always bearing in mind the condition of the market and deriving its revenue from increased royalties on the increasing value of the stumpage, and the government and operator working together in devising the best possible ways and means of conserving the areas of virgin timber, utilizing as much as possible the material on the lands cut over, taking all possible precautions to prevent undue waste or destruction of this, our most valuable provincial asset. I do not believe it possible for a government to anticipate conditions for many years ahead in British Columbia, to fix either rentals or royalties at the present time for any long period of years would not be advisable.

I feel confident the special license tax of 22 cents per acre is not wise from the government point of view at the present time except the tax should be regulated in proportion to the value of the area held; and I am also convinced that the wise method for the government to employ in securing revenue from its timber areas should be more by increasing royalty on the material cut, and also having different royalties on the different qualities of the material cut; for instance, there should be a royalty for the different kinds of timber, one for hemlock and larch, another for fir, and yet another for cedar. This might entail a little extra work on the part of the department, but they would be amply repaid as it is certainly not reasonable to imagine that a person will log hemlock, for instance, with the same stumpage tax as the fir on the same area when the price he receives for his manufactured product allows him so much larger a margin of profit on the one material than the other; also I think the royalties should be in proportion to the grades of the different materials. This would have the effect of inducing the operator to log off the poorer grades of material, as the less amount of royalty would afford him a larger amount of profit on these lower grades.

As an illustration of the advisability of this method, take the cedar. The higher grades of cedar are our most valuable timber, and the lower grades are the most worthless. The towage is the same, the cost of logging is greater, cost of milling as great if not greater, as far as the process is carried through, yet the material from the higher grades will bring in the rough from $24 to $40, from the lower $12 to $18. Thus it is evident that the system of blanket royalties as is in force at the present time is not a wise one, and tends to wasteful methods in carrying on logging operations. The same holds good as to the different kinds of lumber on an acre. So long as the supply of the raw material is plentiful the consumer will insist on having the best. Thus we find a sentiment or prejudice created in favor of certain woods for certain purposes. We have the house builders insisting on perfectly clear fir flooring, which when once in place is covered with a carpet and never seen except at house cleaning time. The operator cannot afford to log off the grades and kinds not saleable. I do not think the operators in the lumber business endeavor to educate the consumers sufficiently on the question of using lower grades of material. When we look at all the facts as they are they assuredly do not tend to conservation. The consumer of British Columbia lumber is unnecessarily severe in his demands, demanding the best and rejecting material for defects that really are not material. The lower grades of timber not more costly to operate on from the stump to the car or pile, as our logging camps and sawmills are equipped to handle more profitably the larger and better grades of material. The ground rent is just the same on a hemlock claim and the claim runs largely to low grade timber (and necessarily the stumpage is not as large on these claims) as on the claims of high-class timber and large stumpage, and after the material is cut and moved the government insist on the same royalty on the lower grades and cheaper kinds as on the best. There is no use advocating conservation as long as this condition of affairs exists. The government should assist in this important matter, by a more equitable arrangement of taxation and royalties. Offer every inducement to timber holders to cut as sparingly as possible.

I think it would be a wise regulation to have all logs graded by the government scalers, and for the present reduce the royalty or stumpage tax on what are called rough logs, also on hemlock and larch to practically nothing, even if this necessitated increasing the royalty on the higher grades; there is no doubt the waste is disgraceful at the present time, still we are the victims of circumstances; and even if regretting the waste, still the question of profit must always dictate to what extent with what material we will carry on our operations.

The Cable Locomotive on Steep Grades

A brief and practical address upon the adaptability of the Cable Locomotive on Steep Grades was delivered by Mr. R. L. Fraser, of the Nair-Fraser Timber Company, Vancouver. Mr. Fraser's remarks were as follows:—

When the McNair-Fraser Lumber Company commenced operating the timber limits on which the cable locomotive is now used, the claim had already been opened up as a railroad proposition, the intention being to trail the logs to tide-water with a geared locomotive.

The timber is situated on the side of a hill about two and on-half miles from the water and at elevators varying from 1,200 to 1,600 feet. Starting at the water, for the first mile and one-quarter the grades run from 3 to 16 per cent., and from there on they run from 16 to 22 per cent.

It did not take long to prove conclusively that this kind of a locomotive was impractical on such steep grades, and we began looking around for some other means of getting our logs to the water. As considerable money had already been spent on road-bed, we wanted if possible to get a machine to run on the road already built without adding to the expense any more than was necessary. After considering the matter, we had a machine built something like the one used by the O. K. Logging Co. at their camp at Marshland, Oregon. This machine I shall now endeavor to describe.

The cable locomotive is mounted on two specially designed trucks. Each truck has four double flanged wheels with an independent axle on each wheel, two journals on each. The frame is built up of heavy eighteen-inch I beams and rests on the trucks at three points, two under the boiler end and one under the tank end of the machine. The boiler is 76 inches in diameter by 138 inches high and carries 160 pounds of steam. It is placed at one end of the machine directly over one of the trucks. The engines are similar to those used on a 14x14 road engine. The power which drives the machine is transmitted through a different gear. similar to that used on automobiles, to the bull wheels, over which the cables pass. This differential gear is necessary in order to equalize the strain on the cable while going around curces. This machine works on a standard guage track and hauls herself along on two wire cables one inch in diameter. These cables are stretched along the track just outside of either rail and are held in place by means of hardwood pegs set in the ties. At the upper end of the track these cables are made fast to stumps; then, coming to the machine, they pass under guide shives; from there they pass to the bull wheels and are given four turns around each, after which they pass under guide shives similar to those already mentioned, but located at the other end of the machine, and from there they continue along the track to the water, where they pass around tightening wheels placed at the outer end of the pier. The bull wheels around which the cables are wound are similar to a gypsy or ship's niggerhead, except that the diameter of teh bull wheel is greater, measuring about five feet across.

This system of running a cable over a bull wheel is not by any means a new one, having been used for years in mine haulage in the old country. We believe, however, that this is the first time it has been applied in a logging operation. The bull wheel is not at all hard on the cable as one might expect. The writer knows of a case where a cable used on a bull wheel under much harder conditions than the present lasted twelve years. We have used our Lang's lay cable for nearly two seasons and as yet it shows very little signs of wear.

The initial cost of this machine laid down in Vancouver, freight and duty paid, was in round figures $8,000. The cable cost fifteen cents per foot.

We employ four men on this machine, a driver, fireman, chaser and, in dry weather, a greaser. She can make four round trips in ten hours without any difficulty, and has made as many as five in eleven hours. The size of the turn varies from about ten to sixteen logs. The largest turn we have taken down scaled 34,700 feet B. C. scale.

While we are using this machine as a trailer, I see no reason why she could not operate cars successfully on grades too steep for a locomotive. Her capacity would be limited to the number of empty cars she could haul up the grades. As her speed is not up to that of a locomotice, I would not recommend her for the low grades or long stretches or flat. One thing I would like to point out, however, is that there is no slip. Every time a wheel turns the machine moves in that direction.

In closing, I would like to suggest that should you have, for instance, a piece of timber on a plateau with grades between it and the water up to 25 per cent., you consider the advisability of working an ordinary locomotive on the flat above and a cable locomotive on the steep grades between that and the water.

Protection of Forests From Fire

An address upon "Protection of the Forest Fire" was delivered by W. C. Gladwin, Supervisor of Fire Wardens, Vancouver, B.C. Mr. Gladwin's remarks were as follows:—

With a stand of timber in the Province estimated between three and five hundred billion feet of merchantable timber, already employing directly some twenty thousand men; bringing into British Columbia last year seventeen million dollars, adding to the revenue, and bringing into the treasury of the government approximately two and a half million dollars, the government is fully awake to the great responsibility which rests upon it, to guard in every manner possible this great natural asset of the people.
